There remains, however, another source of danger and difficulty: I mean the Irish question, and the Irish Nationalist party. The perplexities of Irish administration are so numerous that the Government may at any moment make mistakes or find itself in perils which will give the Tory Opposition opportunities for arraigning it. The Nationalist Opposition, by the law of its own existence, is bound to condemn all the Government do. This is what their supporters in Ireland expect from them, and they like it done with at least as much vehemence of language as the rules of Parliament permit. No doubt Mr. Parnell and his friends will complain of much that has been recently done in Ireland. No doubt they will propose to amend the Land Act in several important particulars. No doubt they will introduce some scheme for popularizing local government in Ireland. The resistance which the Government is likely to offer to such proposals will be another ground of contention, but whether such contention will be as bitter as in the last two sessions, or lead to as much waste of time, will depend on the circumstances of the moment. The only prediction that can safely be made is that Irish affairs will continue to occupy, whether the Government like it or not, a considerable share of the attention of the House of Commons. But it is hardly likely that the Ministry will show their hand on the subject of Home Rule or local self-government any more fully than they have heretofore done. They will probably say that till they deal with local government in England they can't be expected to reorganize it in Ireland. There is already a division of opinion among Liberals on the subject; some holding that Ireland must have at least as much of the popular element in her local authorities as England is to have; others thinking that in the present state of Irish opinion this would be dangerous, as giving fresh outlets for political disaffection. The Ministry will doubtless wish to prevent so disagreeable a division from becoming more conspicuous than it now is, and this will be another reason for trying to postpone the topic till another session.

As regards foreign affairs, there are at present no menacing clouds on the horizon. Even those who are least comfortable about Egypt, and who wish that the Government had not undertaken any responsibility in connection with it, do not seem to see what else could have been than what Lord Dufferin has suggested. The behavior of France in the Pacific and in Madagascar has caused some irritation against her; but her internal dissensions may probably make her hold her hand in those regions, and give the irritation time to subside. The rest of Europe is quiet. So far as our foreign outlook is concerned, the Ministry have every facility for fixing their minds on domestic legislation and getting a good deal of it through in this session. If they fail to do so, their credit with the country will seriously suffer. Y.

LA BRUYÈRE.

PARIS, February 1, 1883.

THE collection which the bookseller Hachette has undertaken under the general title of "Les Grands Écrivains de la France" is a literary monument of the first importance. It gives the best text of our classical authors, and the commentaries are full of the most valuable information. M. Servois, who is now Director-General of the French Archives, undertook to publish the part devoted to La Bruyère; he spent several years in this work. His edition is now complete, and it is enough to say that from this moment we have a standard edition of the great moralist of the seventeenth century. The 'Characters' of La Bruyère will always have a chosen place in a good library, next to the 'Thoughts' of Pascal and to the 'Maxims' of La Rochefoucauld. If the 'Characters' is well known, so much cannot be said of its author; he conceals himself in his work, and does not, like Montaigne in his admirable Essays, make the reader familiar with him. "One knows nothing, or next to nothing, of the life of La Bruyère," said Sainte-Beuve in 1836. Since that date, a few discoveries have been made by MM. Walckenaer, Destailleur, Jal, Chatel, Édouard Fournier. M. Servois gives us a biographical essay on his author, which forms a thin volume annexed to his collection.

Jean de la Bruyère was born in Paris, in what is called the Cité, near Notre Dame and the Hôtel-Dieu. He was baptized, probably the day after his birth, on the 17th of August, 1645. His father was not a nobleman; he was controller-general of the *rentes* of the Hôtel de Ville (the *rentes* of the city of Paris). He styled himself in the notarial documents as "noble homme," but this was a proof of commonality, not of nobility. Some of his ancestors were ardent members of the Ligue. This is what De Thou says of the foundation of this famous association: "Principium Lutetiæ factum, ut primaria urbs ceteris toto regno exemplo suo præiret; ubi, instigantibus, inter alios, Petro Bruerio [La Bruyère] seplasiario ac Matthia ejus filio præfecti parisiensis assessore, huic fœderi certatim plerique, qui vita per infamiam in olea et lustris acta decoxerant, nomen dederunt" ('Thuani Historiarum,' liber lxiii.). The elder La Bruyère, mentioned by De Thou, became a member of the "Conseil des Seize"; his name is found among the signers of many letters addressed to the Pope or to the King of Spain. The two La Bruyères of the Ligue are chargeable with complicity in the events of November 15, 1591, on which day Brisson, the first president of the Chamber, and two Councillors were hung. The meetings of the Sixteen which preceded the murder took place in their house. Their importance ended with the power of the Sixteen; they became exiles, and took refuge at Antwerp or at Brussels, where Mathias published in 1603 a 'Rosary of the Virgin Mary.' He was suspected of having taken part in various plots against the life of Henri IV. From Brussels Mathias went to Naples, where we lose trace of him.

Guillaume de La Bruyère, the grandfather of the moralist, was not very proud of his family. He was the modest secretary of the Bishop of Paris. He waited a long time before he bought the place of cabinet secretary to the King. He left two sons and a daughter. Louis, one of the sons, married the daughter of a *procureur* at Châtelet, and had for his eldest son the author of the 'Characters.' He was himself, as I have said, controller-general of the *rentes* of the Hôtel de Ville; he was not rich, and, with the dower of his wife, had only a capital of 12,000 francs; with the interest of this sum and his salary he had to educate eight children. Fortunately, his brother John, who was in better circumstances, lived with him, and helped him to keep house. We don't know what John's profession was; M. Servois suspects that he was a contractor in some *ferme* of the state. It is probable that La Bruyère never left Paris during his youth. At the age of twenty he passed his examinations in law before the University of Orleans (which university, with that of Poitiers, could then alone teach the civil law). His thesis was entitled "De Tutelis et Donationibus." He was admitted, and returned immediately to his home in the Rue Grenier Saint-Lazare.

He lost his father in 1666, and his uncle four years afterward. This uncle had more than 100,000 livres—a great sum for the time. He used silver at table, not pewter; he kept a coach. He lett the greater part of his fortune to his brother's children. La Bruyère found himself in possession for several years of his uncle's carriage and horses. His second brother, Louis, four years younger than himself, took the paternal office of receiver of *rentes*, and married, in 1682, a distant relation of Boileau. The two brothers continued to live together. La Bruyère had become a lawyer, but he had no success at the bar; he was too shy, too meditative, too full of perplexities. After eight years at the bar in the Parlement of Paris, in 1693 he became treasurer-general of France at the financial bureau of the *généralité* of Caen. Having taken the oath at Caen, after the usual fashion, he returned to Paris, and never went back to the bureau. The permission to remain in Paris was granted to whoever had a court office. Racine was a treasurer like La Bruyère, but never discharged the duties of the office. It is not known upon what pretext La Bruyère could remain absent from Caen.

The title of treasurer, which he held for twelve years, and which changed nothing in the routine of his life, had made him, from a bourgeois of Paris, an *écuyer*, a nobleman. He lived like a philosopher, with his books, in the midst of his family. For reasons which are unknown to us, he renounced his independence in 1684, and took a position among the professors who had to finish the education of the grandson of the great Condé. Bossuet was generally consulted as to the choice of these professors, and it was under his auspices that La Bruyère entered the house of "Monsieur le Prince," as he was always called.

The young Duke of Bourbon, his pupil, had just finished his second year of philosophy at the College of Clermont (which soon afterward was called Collége Louis-le-Grand). He had been brought up by the father Jesuits; the Jesuits had also educated his father at Namur, his grandfather at Bourges. The young Prince was somewhat spoiled by the flattery of his masters; he is represented in some confidential letters of his governor to his father as despotic, "quarrelsome, violent, insolent toward his inferiors, extremely childish and frivolous." The education of the college had not been good for him. La Bruyère entered on his new functions on the 15th of August, 1684, with a salary of 1,500 livres a year. His duty was to teach history, geography, and French institutions; the mathematician Sauveur was to teach geometry and fortification. The young Prince was sometimes with his father, who was called Monsieur le Duc, and sometimes with his grandfather, Condé, at Chantilly. The young Prince was himself called the Duc de Bourbon, and was presented at court. He was to have his own household, but Louis XIV., who regulated all such details, gave him a *premier écuyer*, M. de Saintrailles, colonel of the Enghien regiment, thus saving a governor, a first gentleman of the chamber, and a captain of Guards. Louis XIV. also wished to know the names and conditions of all the preceptors. Two Jesuits, by the desire of Condé, remained with the two lay preceptors, Fathers Alleaume and Du Rosel.

Condé took a great interest in the studies of his grandson, and the preceptors wrote constantly to him. La Bruyère tells him what his method is in two lines: "I will always see that he takes from our studies what is the least *épineux* [thorny], and what is most suitable to the great prince." The correspondence of La Bruyère with Condé leaves, however, distinctly the impression that the professor was tired of the inattention and levity of the pupil. Condé does his best—he tries to help the conscientious master; but La Bruyère, having not much satisfaction in his pupil, found no consolation in the frivolous and worldly company in which he had to live. Knowing his own merit, a bourgeois of yesterday, he had to deal with the father of his pupil, who was the most fantastic and terrible of men. The violence of the Condés, which no longer found a noble employment on the battlefield, was now spent in miserable domestic affairs and on innocent people like the timid La Bruyère. La Bruyère did not know how to do things by halves; he had a morbid conscientiousness; he fatigued and disgusted his pupil with his lessons. Too timid in the routine of life, La Bruyère was not timid enough in his teaching. He was bold enough to read the 'Principles' of Descartes to the young Prince, and to make comments on a book which was condemned by the Jesuits. He did it at Versailles, under the eyes of the two Jesuits. To be sure, he had the great Condé on his side, as Condé was a philosopher; he had also Bossuet, who heard his commentaries on Descartes' philosophy with pleasure.

The last letter which has been preserved of La Bruyère's to Condé bears the date of the 4th of July, 1686. Condé died on the 11th of December. His death changed everything, and put an end to the mission of La Bruyère. His pupil became in his turn Monsieur le Duc, while the father of his pupil became Monsieur le Prince. La Bruyère remained, however, in the household, in the quality of a man of letters, with a pension of 1,000 livres. He was styled "gentleman of M. le Duc." He was probably a librarian, and at times a secretary. He certainly must have regretted deeply the great Condé. He shows in his 'Characters' the most sincere admiration for the hero of Rocroi; but his new masters had none of the qualities of Condé. Saint-Simon has left their portraits, and it is impossible that some of the traits of the 'Characters' should not have been inspired by sentiments which were not much different from those of Saint-Simon.

We must repeat here what Saint-Simon says of La Bruyère himself: "The public has lost (in 1696) a man illustrious by his *esprit*, by his style, and by his knowledge of men—I mean La Bruyère, who died at Versailles of apoplexy, after having surpassed Theophrastus, who first was his master, and having depicted the men of our time in his new 'Characters,' which have an inimitable manner. He was, besides, a very honest man, good company, simple, without any pedantry, and very disinterested." The Abbé d'Olivet, in his 'Memoirs,' speaks of him as a philosopher who was content to live quietly with his friends and his books, who chose them both well, who feared every kind of ambition, even the ambition of showing too much *esprit*. If we judge him by the 'Characters' alone, we find not so much severity in the man; we see him at times very passionate, full of a concentrated and deep passion, angry with the men who surround him, disgusted with their follies, their vices, their vanity. His characters are all portraits, it can be safely asserted, and in some cases it can be proved. What a gallery! what a terrible and eloquent protest against a whole generation of men. There is more life in Saint-Simon; more sadness in La Bruyère. Saint-Simon is more dramatic; he carries us with him into the very midst of events and of men. With La Bruyère we see things from above, and we perceive the great currents which lead a country and an age to its ruin.

Correspondence.

ETHAN ALLEN'S BIRTH-YEAR.

TO THE EDITOR OF THE NATION:

SIR: In your comments last week on Mr. Leslie Stephens's tentative list of names for his new "Dictionary of National Biography," you say he has "adopted 1742 as Ethan Allen's birth-year, but 1737 and 1739 are given by other authorities." According to the town records of Litchfield, Conn., his birthplace, Ethan, son of Joseph and Mary (Baker) Allen, was born January 10, 1737-38. He was the eldest child of his parents, who removed to Cornwall, Conn., when he was about two years old.

JOHN D. CHAMPLIN, JR.

NEW YORK, February 21, 1883.

POPULAR SCIENCE IN THE COUNTRY.

To the Editor of The Nation:

Sir: Those who are confined to the close quarters of the city, and have to depend for their scientific instruction and entertainment on the limited range afforded by occasional lectures from such men as Professor Marsh or Professor Tyndall, may fail to realize the liberal opportunities of some of our Western localities. Dr. ——, for example, is giving a series of Sunday evening discourses from his pulpit in Akron, Ohio, one of which is reported in the Akron *Daily Beacon* of February 14. (We cannot answer for the correctness of the report.) His subject was "The Creation," and his laudable purpose seems to have been to "justify the ways of" Moses "to man." If the newspaper report is to be trusted, the following is the substance of a part of this "most interesting discourse":

"In that period, science has shown, great land and sea whales, with monstrous serpents and smaller animals, as well as winged, web-footed fowls filled the earth, air, and seas. Skeletons of animals and monsters are in the great museums of the world, showing the huge and bulky creatures of that age. They roamed over the earth and ploughed through the seas, tyrants and kings of all the earth. It was shown that at St. Louis there is one of those ancient specimens, so large that a man can stand erect and walk down the throat of the animal into its stomach, which is as large as a common bedroom. Other specimens were referred to, 120 feet long. These animals had great mouths, and a full-sized ox would make but a single bite. It was shown that these creatures were so abundant that from their fat and substance have come the great oil deposits of the earth, as the vegetable growth formed the vast coal beds. God's goodness was shown in providing in that far-off age for the people of to-day. What a sight it would be to-day to see animals large as a steamboat roaming over the earth, browsing off the tops of the highest trees! If such creatures lived—and science shows they did—it is no wonder that the earth is full of crude, strong-smelling fat."

No wonder, indeed! The only room for surprise is in the fact that so little now remains of these disagreeable and malodorous remains. Is there not, we would timidly inquire of the Rev. Dr.—may there not be at least—something providential in that? What if these terrific animals had been still more abundant, and, finding plenty of "full-sized oxen" for their occasional "single bites," had deposited their "Oriental fragrancy" in the strata beneath every rural gentleman's garden? How truly painful it would have been to any sensitive mind to purchase some modest patch of ground for a suburban residence, and on digging the cellar to come plump into the "crude and strong-smelling" reminiscences of a former occupant of the size of a Cunarder! Most providential it is, indeed, that we are spared this painful experience, unless it may occasionally occur in Akron, Ohio.

The reporter goes on to promise the public that "two more Sundays will be given to the earth and its creatures before Adam came and found all complete. It will well pay the time spent to hear the story of Moses and the scientific facts laid alongside and compared."

"At the conclusion of the Doctor's discourse," we are gratified but not surprised to learn, "that grand chorus from 'The Creation,' 'The Heavens are Telling the Glory of God,' was rendered with thrilling and magnificent effect."

E. R. S.

HARVARD COLLEGE AND DR. BUTLER.

To the Editor of The Nation:

Sir: At the dinner of the Harvard Club of New York, on the 21st inst., frequent reference was made to the ludicrous position in which the authorities of the University would be placed in being called upon to confer the degree of LL.D. upon the present Governor of Massachusetts. Whether there is a rule or custom requiring such a step on the part of these learned men or not, I do not know; but it is quite certain that it will not be by any means the first time they have occupied just such a position in the matter of conferring this degree. Again and again they have bestowed it on men whose only possible qualification for it was their high official station, at which they had arrived in many cases by the vicious methods in use among machine politicians, and which they filled with little or no ability or merit.

Does this high-sounding degree, then, mean anything? If so, what? Does it imply learning, intellectual power, or statesmanship? Or is it simply the tribute which Harvard University pays to "the butcher, the baker, the candlestick-maker" who happens also to be a smart and successful politician? What sort of civil-service reform is the University teaching? "Get yourself elected President or Governor, no matter how—and no matter how you perform the duties of your office—and we will crown your successful efforts with our highest degree."

Looking at the long line of learned Doctors created within the last few years, the men of Harvard may rest assured that the Governor of Massachusetts will play his part in their annual farce quite as respectably as most of those who have heretofore been invested with this great honor. Perhaps he may say (because, as we all know, he is a humorous man) that Harvard University has discovered a very good way of making really great men "small by degrees," if not "beautifully less."

Anti-Butler (Harvard, '63).

Lowell, Feb. 26, 1883.

SOUTHERN HOMICIDE.

To the Editor of The Nation:

Sir: For a number of years I have been a reader of the *Nation*. It and the *State*, of Richmond, Va., are the only papers which I now see regularly. I have just read the issue of the 18th of January of the *Nation*; the *State* of the 1st instant had been read previously. In this number of the *Nation* so much has been said, and well said, by the correspondents as to the general accuracy of the statements made by the *Nation* in reference to social homicide in the South, and the causes which have produced and still perpetuate the present unfortunate state of affairs, and by the *Nation* itself as to the means which should be used to put a stop to it, that I shall not attempt to improve upon the one, nor further confirm the other; but only beg to offer a word of encouragement in this disagreeable effort to rid our system of the lead and iron, the probing for which is naturally so painful to the patient.

While not ready to insulate the *Nation* upon a pedestal of integrity quite so dangerously lofty as "A South Carolinian," nor to do obeisance before it with a reverence quite so profound, still I will say (and I believe I am giving expression to the opinion of the *majority* of "decent people" in the South—not simply "the best men"—in saying it, although the *Nation* may not think so) that I have always felt truly grateful to the *Nation* for the position it has taken in reference to "troops," "repudiation," and "social homicide," or against Grant, Mahone, and the *State*. I say sincerely, I thank thee that thou art not as other men are *quoad hoc*, or these poor publicans; and I wish the publicans a speedy repentance.

The fathers of the past generation could well say to their sons, when leaving home, "Don't make yourself a fool because you are from Virginia"; but repudiation and social homicide are fast teaching the sons to say, "Don't tell anybody you are from Virginia." One does not feel specially prone to brag, abroad, of being a fellow-countryman of "Boss Billy," or of the chivalrous participants in "affairs" and defenders of the "knife-and-pistol" solution of petty difficulties. There are two Virginians in this town, at any rate, who keep exceeding dark on that topic just now.

Although I am a friend of the *State*, and "the stock of that shotgun sticking out" had been observed before you called attention to it, still, being at a safe distance, and knowing it to be the *State's* old shotgun, and harmless to riddle burgers or worse knaves than I am, I shall sign my name to this and take the risk, abuse and all.—Yours truly, another renegade,

T. R. Sampson.

Athens, Greece, Feb. 6, 1883.

THE "NATURAL METHOD" OF TEACHING LATIN.

To the Editor of The Nation:

Sir: The correspondence that has appeared in your paper on the subject of the so-called "Natural Method of Teaching Latin" has suggested to me to ask for space to point out what appears to me to be the fallacy which underlies the arguments of its advocates.

This method aims at teaching a foreign language, not mediately, through the words and phrases of the learner's native tongue, but by producing, if possible, an immediate and direct association between the foreign word or expression and the thing signified by it. In other words, it aims at repeating the natural process by which the learner originally acquired a knowledge of his native tongue; and this is its great merit in the eyes of its admirers. But these admirers lose sight of the very important difference which distinguishes the mental state of a child when he first begins to learn his native language, from the mental state in which he afterward approaches the acquisition of a foreign language—a difference which constitutes so essential an alteration in the conditions under which nature originally worked as to render a repetition of that process impossible.

When the child begins to pick up his own language, his mind is entirely unoccupied by any verbal symbols whatever, and, impelled by the powerful instinct of association implanted in him by nature, he rapidly and with the greatest ease catches them up from his playmates and guardians, and learns to associate the proper symbols with objects around him. But this state of mind is possible only once in the course of his linguistic experience. Very different is the state of his mind when he comes to learn a foreign language. It is already preoccupied with an extensive scheme of verbal signs, linked by almost indissoluble bonds of the strongest association with the objects and events that present themselves in his daily experience, and it has become impossible for him to begin the task of associating a new set of signs with those objects without the old signs constantly thrusting themselves in between the new signs and the objects they stand for, whether he wish it or not. In other words, the natural instinct now is to associate the new signs directly with the old and familiar signs, and only indirectly with the things signified. The usual method, therefore, of teaching a foreign language by means of and with constant reference to one's native tongue, has a juster claim to be called the "Natural Method" than the method usually so called; and it is the method which has been followed by the most successful teachers of Latin from the days of old Roger Ascham, who, when recommending the master to begin his instructions with the easier letters of Cicero, writes: "First,

let him teache the childe, cherefullie and plainlie, the cause and matter of the letter; then let him construe it into Englishe, so oft, as the childe may easilie carie awaie the understanding of it."

That Latin should be taught by means of, and with constant reference to, one's native English, recommends itself further to our judgment when we consider that in teaching it the chief end aimed at is the acquisition by the pupil of the power of translating accurately and at sight into idiomatic English a passage from a Latin classic, and the further power of rendering into correct and not inelegant Latin a passage from an English classic. Any young man who is master of these accomplishments may congratulate himself on the good use he must have made of a long course of training at the hands of judicious teachers. If he has not acquired the accomplishment of being able to converse in Latin, he can console himself with the very just reflection that to be able to converse in a dead language is, after all, an accomplishment more curious than useful, and that the performance of the best modern adepts in Latin conversation would, it is to be feared, sound sad jargon to the ears of a Terence.

E. Hawksley Rhodes.

11 Norfolk Road, London, Feb. 8, 1883.

ARCHÆOLOGY IN GREECE.

To the Editor of The Nation:

Sir: Your correspondent, "W. J. S.," is undoubtedly right, from a strictly topographical point of view, when he writes that stone-houses are now being built on the northern slopes of the Acropolis; but as yet there is no solid building far enough up on the slopes to interfere with any ancient remains that may exist connected with the Acropolis as such, or to cover any antiquities that may have been thrown down from above. It is safe to say that the slopes of the Acropolis, so far as they have been encroached upon, present no greater interest than any other central portion of the site of ancient Athens.

I am by no means of opinion that such laws relating to the exportation of antiquities as those of Greece are advisable everywhere, or indeed permanently in Greece. Their justification there is that every great civilized country except the United States is already in possession of important remains of Greek art, and that had matters been left to take their course (precisely on account of the feebleness of Greek resources alluded to by "W. J. S.") there would soon have been remains of Greek antiquity everywhere except in Greece. One may well deplore the restriction as a hindrance to the advance of archæology; but it is difficult not to sympathize with the motive, which is most unjustly stigmatized by "W. J. S." as "the showman's feeling," and to contrast it with the American system of taxing the importation of antiquities and works of art. While all well-informed persons must concur in "W. J. S.'s" views regarding the inestimable profit to Greece and to the world of the transportation to England of the Parthenon marbles at the time when Lord Elgin took them, I cannot but think that now, in these days of easy and rapid communication, those precious heirlooms of Athens would be more useful were they taken from their dingy quarters in London and restored to the Acropolis. They have performed their function of a chief factor in opening the eyes of the world to the preëminence of ancient Greece; and the incalculable gain to civilization thus acquired is the only justification—and although unanticipated, it is ample justification—of the ruthless despoiling of the Parthenon.

Regarding corrupt and inefficient enforcement of any law there can be but one opinion among honorable men the world over. But opposition to temporary and honest enforcement by Greece of her law forbidding the exportation of those memorials of her glorious past that are left to her, must commend itself chiefly to professional dealers in antiquities.

I am, sir, very respectfully,

A Member of the Archæological Society of Athens.

New York, February 24, 1883.

Notes.

The eleventh of Mr. W. M. Griswold's Q. P. Indexes (Bangor, Maine) is 'A General Index to the *Contemporary Review*, the *Fortnightly Review*, and the *Nineteenth Century*,' filling thirty-six pages, and covering the years 1865–82. It is needless to enlarge upon the merits of this key (by author and subject) to the choicest periodical literature for the term indicated. Let it not be forgotten, however, that it is one of a series, and that its value is cumulative, so to speak. Mr. Griswold, placing at the end some justly laudatory remarks on his labors from German sources, reports in a footnote the singular refusal of Mr. F. A. Brockhaus to send him a free copy of *Unsere Zeit* for the purpose of being (gratuitously) indexed. This is indeed shortsighted.

Dr. Holmes propitiates the readers of the new edition of his 'Professor at the Breakfast-Table' (Boston: Houghton, Mifflin & Co.) by referring to the changes which twenty-five years have made in standards and opinions—instancing the utmost speed of the trotting-horse, and the degree of heresy in a warm Unitarian like himself, of which the one has been heightened and the other significantly lowered. He therefore hopes that "what was once an irritant may now act as an anodyne." The same publishers have brought out a 'Lowell Birthday-Book,' in which there are numerous happy adjustments of selections to the characters whose birthdays are noted on the opposite page, and, it is superfluous to add, a delightful store of wit and wisdom in verse and prose.

"Primers for the People," edited by Eugene L. Didier, and issued by the People's Publishing Co., Baltimore, promise a great deal for a little money—*e. g.*, in No. 6, "A Primer of Criticism," as to certain American writers—"Pretentious mediocrity exposed to the sunlight of truth."

Mr. Francis Parkman's pamphlet, 'Some of the Reasons against Woman-Suffrage,' has been reprinted "at the request of an association of women" in and about Boston.

Oliver & Jenkins, New York, publishers of the *Wheel*, will begin next month an illustrated weekly chronicle called the *Amateur Athlete*, similar in size and general appearance to the periodical already mentioned.

Circulars relative to the collection and distribution of astronomical intelligence have been sent out by the Harvard College Observatory since it was made the American centre of such collection and distribution in an international scheme—Kiel being the corresponding European centre. Mr. John Ritchie, jr., has been placed in charge of this service. Observatories and private individuals are admitted to the benefits of the special circulars, or of telegrams at their own expense.

We have received the slip of dates, subjects, and reference lists accompanying the Hopkins Hall lectures of Prof. James A. Harrison, at Baltimore, on Anglo-Saxon Poetry, which terminate to-morrow. Students anywhere would find it a useful guide to texts and general treatises.

In the February *Bibliographer* (J. W. Bouton), Mr. Edward Solly reprints Wagstaffe's list of the various editions of the 'Eikon Basilike,' and indicates some not contained in it, with a view to as perfect an enumeration as possible and a determination of the order. Even the first edition cannot be identified with certainty.

The London *Times* of February 12 gives a tolerably full account of the Ashburnham MSS. which have been offered *en bloc* to the British Museum, and the purchase of which is now under consideration. The collection is in its subdivisions Italian, French, and English, mainly; the first consisting of the so-called Libri Collection, with its Pentateuch codex of the seventh century. The English, or Stowe Collection, embraces a volume containing more than forty Anglo-Saxon charters, from the close of the seventh century to the Conquest; ten volumes of "Hanoverian Papers" (the correspondence of the Electress Sophia and her son, afterward George I.); the letters and papers of Arthur Capel, Earl of Essex, Lord-Lieutenant of Ireland under Charles II.; the correspondence of various English ambassadors in the reigns of Elizabeth, James I., Charles II., and James II., William and Mary, etc.; the original diary of Henry Hyde, Earl of Clarendon, for the year 1688, etc. In respect to the bindings and the illuminations, the Ashburnham MSS. are almost as remarkable as for their contents. The schools of England, France, Germany, Flanders, and Italy are represented.

"A Librarian" asks us to call attention to what is in effect a deception practised on the reading public, and on buyers generally, in the republication, *literatim et punctuatim* (without the slightest hint of its being the same book), under the title of 'A Jolly Summer,' with the imprint of 1883, of a book published in 1880 under the title of 'College Tramps; or, Adventures of a Party of Yale Students in Europe.'

In the *American Naturalist* for March, Prof. V. M. Spalding has a suggestive article on "'The Plains' of Michigan," meaning the tracts sometimes called "the barrens" in the northern central portion of the lower peninsula of Michigan. They lie in the pine belt, and have small capacities for agriculture, and the writer urges their improvement by the State for tree culture. Circumstances favor their control by the State.

With the March number the new eclectic magazine published at Buffalo, the *Modern Age*, has been enlarged to sixty-four pages. Its aim is to devote more attention to foreign Continental literature than is done by other publications of its kind, and a large proportion of the articles are therefore translations from French and German papers, carefully and neatly done, as far as we have examined them. The March number is very attractive, and contains hardly anything not worth reading. The low price of the magazine is also in its favor.

The *Belletristisches-Journal* of this city has issued as a premium for the subscribers to the thirty-second volume a handsome and finely-printed steel portrait of Schiller, as a companion piece to the Lessing, Wagner, and Liszt issued in previous years. The Schiller portrait was engraved after the Dannecker bust by A. Krausse, of Leipzig. This paper, by the way, unites some of the best features of German and American journalism. It contains novels and essays by leading German writers, and at the same time covers the fields of American politics, literature, science, and art. The partly humorous account of New York city life from week to week is one of its most readable departments. The editor's letters from the Far West, which began to be printed last summer, would, in book form, make a valuable addition to American tourists' literature.

We have before referred to the reports of the Norwegian "North Atlantic Expedition" on the *Voringen*, directed by Prof. H. Mohn. The last instalment, No. 8 of the Zoölogy, contains the first part of Herman Friele's valuable report on the mollusks, embracing the Buccinidæ. This forms a careful monograph of the members of the group native to the northern portion of the North Atlantic, occupying thirty-five quarto pages in parallel columns of Norwegian and English, and illustrated by six excellent plates and a map. Illustrations of the wonderful variability of these arctic forms, perhaps partly due to hybridization, are accumulated, together with a host of valuable and important biographical data on the species, of which several are described as new.

Parts 66–69 of 'Brehm's Thierleben' (chromo edition; B. Westermann & Co.) deals with rodents chiefly. The colored representation of the porcupine must be highly praised as lifelike. Among the capital wood-engravings is one of the South American bizcacha, not often represented.

No. 102 of the *Zeitschrift* of the Berlin Geographical Society (New York: L. W. Schmidt) contains Dr. Koner's customary exhaustive classification of the geographical literature of the year 1882. The monthly *Verhandlungen* are as usual full of the latest intelligence from the field of exploration.

In No. 2 of the Naples *Esplorazione*, F. Borsari has an historical introduction to what promises to be an extended discussion of the prime meridian and universal time reckoning.

M. Em. Terquem, 15 Boulevard St.-Martin, Paris, began last month the publication by subscription of a 'Bibliographie des Bibliographies,' by M. Léon Vallée, of the National Library. The first part will be an author-catalogue, with complete titles, checked where possible by the works themselves at the compiler's command. The second part is arranged by subjects, with references from the abridged titles to the fuller. The edition will be small; the size of the book, 900 pages 8vo; and the price, 20 francs.

The Brothers Henninger, Heilbronn, Würtemberg, have in press 'Κρυπτάδια: recueil de documents pour servir à l'étude des traditions populaires.'

A farewell dinner was given on February 1 to the Danish author, George Brandes, at Berlin, where he has lived for five years, having left his country as a victim of political persecution. Among the guests and speakers were Rodenberg, Scherer, Spielhagen, Hopfen, Lindau, Gneist, Franzos, Friedrich Kapp, and many other men of letters. A poem by Paul Heyse on Brandes was also read.

In No. 2 of Vol. v. of the *American Journal of Mathematics*, Prof. Sylvester concludes his article—perhaps it would be more proper to say his treatise—"On Subinvariants; *i. e.*, Semi-Invariants to Binary Quantics of an Unlimited Order." Prof. Arthur Cayley, the great English mathematician, contributes "A Memoir on the Abelian and Theta Functions," being a revision and extension of the course of lectures which he delivered last year at the Johns Hopkins University. The scientific and personal relations of Profs. Sylvester and Cayley have been so intimate, and have extended over so long a period, they have so often worked on a subject "jointly and severally," that we presume in many cases it would be impossible for themselves to disentangle and properly assign to each the credit of many of their contributions to science. The mathematical world have come to regard them as a pair of intellectual twin brothers. Mr. W. E. Story finishes the number with a memoir "On the Non-Euclidean Geometry," more especially in its relations to spherical trigonometry. He had before treated the subject in its relations to plane trigonometry in Vol. iv. (pp. 332–335) of the *Journal*. To all except professional mathematicians, and those, too, of a high order, any attempt to convey a notion of the subjects and objects of these papers would be simply unintelligible. Doubtless they will be read by nearly every one of that not very large class whose mathematical studies have been sufficiently extensive to understand them.

—The late Dr. Leonard Bacon, of New Haven, in the early days of the slavery agitation, proposed to solve the problem through the "Colonization Society," which aimed to take the free and emancipated blacks clean out of the country. He was unable, however, to witness the success of this experiment, because the Society was killed or reduced to insignificance by a tract written by William Lloyd Garrison, and which made much stir at the time, entitled "Thoughts on Colonization." Still, Dr. Bacon did not relinquish the hope of having slavery dealt with in his own way. He attempted, by an organization which fell still-born, to withdraw the support of anti-slavery men from the genuine abolition societies. He even went so far as to oppose the formation of a political party antagonistic to slavery, which he early foresaw and deprecated as an evil, and he joined that party only at the eleventh hour. In fact, his share in the anti-slavery controversy was a portion of his career which we should think his friends or biographers would not care to recall, or at all events dwell upon with any emphasis. We have, therefore, been somewhat surprised to see it brought up in an article, by one of his sons, in the March *Century*, entitled "A Good Fight Ended." It is the more singular because it describes the "fight" as having been directed primarily rather against "the so-called abolitionists than against the advocates of slavery," and suggests that it nevertheless had the curious result of leading to the Emancipation Proclamation, thus furnishing a new key to Alcott's untitled lines—

> "*Thy* trenchant and emancipating pen
> The patriot Lincoln snatched with steady hand,
> Writing his name and *thine* on parchment white."

The object of precipitating this controversy is not apparent, unless the article is to be taken as a prospectus or foretaste of the family Memoir now in preparation. If it be this, we shall read with less interest than we now expect to do the chapters narrating Dr. Bacon's part in the good fight at Canterbury, on one side of which was Prudence Crandall and her friends; and at New Haven, over the Manual Labor School for blacks, on one side of which were Simeon Jocelyn and Arthur Tappan.

— Mr. C. F. Holder, in *Lippincott's*, gives an entertaining account of sword-fishing "down East," in which he introduces a sword-fishing captain, whose manner of conversation is too racy and natural to suggest literary invention. Captain Sam's description of his early innocence and inexperience, when he was a "regular high-tide clam-digger, always a' lookin' fur the wind to lew'ard and the like," his confidential admission, "when I ain't a' talking you'll know I'm sick," and his account of his prudent father's permitting him to take the family schooner and go sword-fishing, because she was "insured and hogged," and many other little touches, will vividly recall to readers who have any knowledge of the New England coast the local skipper. Mr. Alfred M. Williams writes entertainingly on the subject of the Cherokees, who, it seems, in addition to other white habits, have acquired that of running a political convention in the approved white manner. The convention particularly described by Mr. Williams was presided over by the Hon. Pig Smith, who opened the proceedings with the familiar appeal for "harmony and enthusiasm"; a committee was appointed to nominate another committee to "run" the party for a year, and its report was adopted without debate or division, and so on. Committees have to withdraw for consultation into the thicket, instead of a hotel parlor; but, with the exception of a few little differences like these, caused by a difference of circumstances, and which will doubtless disappear as the thicket is swept away by the tide of civilization, party "politics" among the Cherokees seem to resemble those of the rest of the country. We have no doubt that the Honorable Pig Smith has a "home" in which he "develops strength" from time to time as a candidate for one office or another, and is as gloomy when a want of harmony is displayed in the party as any statesman at Albany. The by-paths of American history occupy all the magazines more or less, and under this head "The Story of the Palatines," the colony from the Lower Palatinate of the Rhine founded on the Hudson, in Queen Anne's time, as told by Mr. Charles Burr Todd, deserves attention, and, for a queer bit of contemporary American life and manners, the account given of the "Polanders" in Texas, by R. L. Daniels, is worth reading. In "Our Monthly Gossip" C. P. W. makes a protest against the abstruse and recondite nature of the subjects to which "intellectual" women devote themselves, and complains that a woman will abandon herself with painstaking assiduity to the study of early Italian art, Eastern mythology, or the categories of Kant, and lapse into "a state of placid speechlessness" if some subject is introduced into conversation like the latest election, the defeat of Arabi, or the Irish troubles. This has been one of the peculiarities of the *femme savante* since the days of Molière, and the type of woman who will discuss matters of the same kind and in the same way that men do—that is to say, the woman from whose conversation, if put in print, you could not tell whether she was man or woman—is still to come. When it does, intersexual sarcasm and humor will be seriously lessened, whatever other effects may be produced.

—A curious tempest in a teapot is now raging in England concerning the merits and demerits of the new American school of international novelists. In the same number of the *Century* in which Mr. Warner made some humorous reflections on the British strawberry, Mr. Howells inadvertently praised the art of Mr. James at the expense of the art of Dickens and Thackeray. No sooner did this reach England than the *World*, after its fashion, and the *Saturday Review* after its fashion, not quite as unlike as might be wished, poured forth the vials of their wrath on the head of Mr. Howells. Close on the heels of the *World* and the *Saturday Review* came a Scotch reviewer in *Blackwood*. By this time very little remained of Mr. Howells and Mr. James, who were reduced to impalpable powder. But worse remained behind. After the weeklies came the monthly; after the monthly comes the *Quarterly Review*, and the dust of the pulverized American novelists is rudely scattered to the four winds of heaven. The *Quarterly* article is quite in the old style. It deals freely in invective, in innuendo, and in false statements. It defends the throne and the altar almost in the language of the taproom and the stable. There has been a languid curiosity here to know who it was that was thus annoyed by the success in England of the American novelists. The London correspondent of the New York *Tribune* tells us that the *Quarterly* article was written by Mr. L. J. Jennings, the own and only London correspondent of the New York *World*, formerly the famous vituperative editor of the New York *Times*; and this is rendered probable by the fact

that the London correspondent of the New York *World* telegraphed to that journal that the then forthcoming *Quarterly* would contain a "noteworthy" article attacking the American novelists. He makes one insinuation that is worth notice, which is more than can be said of any of his opinions, and that is, that Mr. James wrote the article on Howells which appeared in the *Century* a few months ago, and that therefore Mr. Howells's notice of James is part of a tit-for-tat arrangement. There is no truth in this whatever, as Jennings must or might have known, because that article was signed by the author, Mr. T. S. Perry.

—It is a very pretty quarrel as it stands, though, unfortunately, quite one-sided, as the American guns after the first shot have been wholly silent. But an unexpected ally has appeared. Just as France fought with us against the British a century ago, so now a French critic comes to succor the American novelist. In the *Revue des Deux Mondes* for February 1 is begun a series of articles on "Les Nouveaux Romanciers Américains." The first is signed Th. Bentzon, and is devoted to a consideration of the writings of Mr. Howells. It opens with a consideration of the decadence of the novel in England. "It is to America, beyond all doubt, that we owe to-day the best novels written in English; England herself attests this. During the year which has just passed, no book has had the success of 'Democracy'—that brilliant and curious satire of American manners, which only the good nature of a people sure enough of its strength to be ready to learn the truth could make palatable. Translated at once into all languages, 'Democracy' has interested the Old even more than the New World." The critic then cites Mr. Bret Harte's "Flip," "in which a great talent begins to weaken," Mr. Cable's creole stories, and "the profoundly interesting studies of contemporary life in America" by Mr. Howells and Mr. James. The rest of the long essay is taken up with detailed description of Mr. Howells's stories and with highly favorable comment. The whole paper is one to be read with attention by any one anxious to see how an exact and realistic description of American life strikes a clever and highly cultivated Frenchwoman.

—While perfect comity exists to-day between the people of Rhode Island and their neighbors of Massachusetts, the scholars and antiquarians of the two States contrive to perpetuate the historical animosities that grew out of the oppression by "the Bay" of the "Providence Plantations." The two latest issues in the series of "Rhode Island Historical Tracts" (Providence: S. S. Rider) are in evidence. One is a posthumous "Defence of Samuel Gorton and the Settlers of Shawomet," by the late Chief-Justice Brayton; the other, Peter Folger's "Looking-Glass for the Times." Gorton was a man who contrived, without being vicious, to make every community uncomfortable in which he planted himself, and, in spite of his sufferings by persecution, is for the historian a rather humorous figure in the early annals of the colonies. No one can complain of the view of his character taken by such Massachusetts writers (to mention the latest) as Dr. George E. Ellis, in the 'Memorial History of Boston,' and Mr. S. H. Gay, in 'Bryant's History of the United States,' and there is perhaps a little unnecessary heat in Mr. Rider's introduction to Judge Brayton's 'Defence.' This document covers the whole ground, but the arrangement of the narrative and development of the argument are lacking in clearness, and we may suppose that the author had blocked them out for subsequent revision. They do not add much to what was already known. Mr. Rider admits that the doggerel of Franklin's estimable grandfather Folger has no proper place in his series. It is a protest against Puritan religious intolerance, however, and so far it is in harmony with the other tracts. Moreover, in the following lines we have the key to the treatment of Gorton, whose mystical interpretations of Scripture confirmed the founders of Harvard College in their insistance upon a "learned gospel"—*i. e.*, on insuring against theological vagaries by putting thoroughly trained and educated men, and these only, in the ministry:

> "And since that, many Godley Men
> have been to Prison sent;
>
> But these Men were, as I have heard,
> against our *College Men;*
> And this was out of doubt to me,
> that which was most their sin."

—M. Édouard Cuq has read before the Académie des Inscriptions a monograph on the *Consilium Principis*, the Roman Privy Council, tracing its progressive growth and the process by which it gradually absorbed all the power of the Senate and much besides. The study of inscriptions, which has done so much to refashion our knowledge of the orthography and lexicography of the Latin language, has given M. Cuq good results in regard to the Roman jurisprudence and statecraft. He has been able to trace the formal constitution of the Consilium back of Constantine, where it was previously supposed to stop, at least as far as to Hadrian. In his reign the body which started in the reign of Augustus as a mere private convenience of the Emperor—a council of war on a peace footing—appears with a complete organization and regular officers. M. Cuq refers to a number of cases submitted to its jurisdiction, and asserts that we can follow the discussions that arose among its members, and trace the motives that influenced the Emperors to this or that decision. One of the most important of its functions was that of a High Court of Justice. Under Augustus judgments were still given by private judges chosen by the parties themselves, and there was no appeal. In the third century of our era all justice was administered by delegates of the Emperor, and there was an appeal in all cases to the Consilium Principis, then called the Consistorium. How this complete and most momentous change was brought about is partly set forth in M. Cuq's memoir, and is to be explained in full in a volume which he is preparing. The memoir is chiefly concerned with one feature, the rise and extension of the right of appeal, a right which greatly increased the power of the Emperors. The original Roman law admitted appeal in one case only, that in which a judge had delegated his powers, when the decision of his subordinate was always subject to his revision. In order to be able to intervene in judicial decisions it was necessary for the Emperors to create and multiply cases in which magistrates could be considered as their delegates, and this they did so successfully that they had absorbed the whole administration of justice, as we have seen, in criminal matters by the time of Septimius Severus, and in civil matters by the third century. The originality of M. Cuq's investigation may be judged by this, that though Consilium Principis and Consistorium both appear in the Latin dictionaries, so little definite was known about the body that neither word was judged worthy of admission into Smith's 'Dictionary of Greek and Roman Antiquities.'

—Prof. Tyrrell has collected in a sumptuous volume, under the title, 'Dublin Translations into Greek and Latin Verse,' the Greek and Latin verses that have appeared before in the *Hesperidum Susurri* and in that famous college magazine, the *Kottabos*, to which we owe, among other charming things, the application of the solar myth to Max Müller's personality. The volume is a distinct offset to the 'Arundines Cami,' 'Sabrinæ Corolla,' and similar collections made on the other side of St. George's Channel, and the Dublinity of the pieces is insisted on with unnecessary vehemence. The Celtic light cannot be hid under the bushel of English names. It is sure to burn through, and he who has been privileged to worship the *genius loci* does not need to be told that these poems come from the quick brain of Trinity College. Detailed criticism would be out of place except in a classical journal, and even there these verses ought not to be taken too seriously. Much will depend on the mood in which they are approached. If one is in a good humor and disposed to be amused, there is a certain amount of jocularity to be got out of Latin mummeries of 'Old Father William' and 'Billy Taylor,' Thackeray's "Three Sailors," and Hood's "Bachelor's Dream"; while Prof. Tyrrell's Tennyson in the manner of Theocritus, and Shakspere in the manner of Plautus, and Prof. Palmer's Catullian "Sally in our Alley" show a surer touch and give a higher pleasure. But if one should not be in a good humor, and should unluckily open the volume at page 223, where a wretched English version of Goethe's "König von Thule" has been rendered into a wretcheder cento of Homeric verses, in which ignorance of Homeric grammar is matched by ignorance of Homeric archæology—in such a case it might be possible to say harsh things about an exercise which is too apt to degenerate into parrotry and pedantry. In the true Irish spirit, some of these elegant scholars have laid sundry traps for the unwary, and evidently take a genuine delight in such classic "April fools" as dubious quantities and hard readings; but there is a Nemesis that overtakes all such jesters, and the volume is not free from hopeless grammatical blunders and versification that would not pass muster in climes far less favorable to classical study than are the banks of the Liffey. Still, the book is brimful of cleverness, as might have been expected, and point and pathos peep out of every corner. The titles alone are studies. For specimens the *Nation* has no space, and can only give Mr. Tyrrell's epigram addressed to Mr. Matthew Arnold, although that too is marred by an erratic quantity, which can only be defended by indifferent authority from the Anthology:

> 'μηδὲν ἄγαν' ὑμνεῖς· ἄγαν ὑμνεῖς· οὔ τοι λήγεις·
> ὦ 'γαθέ, μηδὲν ἄγαν, μηδὲ τὸ 'μηδὲν ἄγαν.'

DRESSER'S JAPAN.

Japan: Its Architecture, Art, and Art Manufactures. By Christopher Dresser, Ph.D., F.L.S., etc. London: Longmans, Green & Co.; New York: Scribner & Welford. 1882.

Mr. Dresser states in his preface that his excuse for adding to the number of our books on Japan is that he writes as a specialist. He says truly that although we have heard much of the manners and customs of the Japanese, and of the aspect of their country, we have hitherto known little of their architecture, and of the relation of their minor arts to it. He therefore attempts to explain the origin and the present forms of the architecture, and how these present forms have resulted from climatic and religious influences; also, how the character of the ornamentation bears evidence of similar influences. The book is divided into two parts, in the first of which an interesting account of the curious sights, peculiar customs, and religious ceremonies which present themselves to the traveller in Japan, is coupled with observations on what pertains more strictly to the main theme; while the second treats of

the architecture and other arts of the people. In this second part the author begins with a brief consideration of the two religions which exist in Japan—the Buddhist and the Shinto; and he finds that these have supplied respectively the two fundamental impulses which have given the art its character—namely, the love of nature and the spirit of conscientiousness of workmanship. The Buddhist "will not destroy an insect or injure the smallest created thing," and he has a peculiar regard and affection for the beauty of these things, and for flowers and shrubs; while in the Shinto religion "the mirror is said to symbolize the manner in which actions and thoughts should be open and visible." Hence the constant use of natural forms in Japanese art, and the thoroughness of work and perfection of finish even in hidden members of architecture, and on the insides and the bottoms of their various objects of manufacture.

In the view of some able scholars of art it is considered that the Japanese modes of building are such as hardly to rank properly under the head of architecture, partly on account of its openness and the want of fixed foundation, and partly on account of its want of constructive character. The first of these reasons for this view seems not to occur to Mr. Dresser, and against the second he contends—showing that building in Japan affords instances of some curious and highly ingenious constructive devices, especially in the pagoda, where the enormous upright central pillar, which to the superficial eye appears to rest upon the ground and to stiffen and support the successive stories, is in reality hung from the top, the lower end being held several inches from the ground, like the clapper of a bell, so that in times of earthquake it may swing back and forth, and thus by its weight keep the centre of gravity within the base of the tower. Such devices are admirably suited to the conditions that have to be met, no doubt; but there is yet force in the objection that Japanese architecture is not generally based upon entirely sound constructive principles—that the constructive sense of the Japanese is somewhat deficient. For instance, on page 148 (Fig. 47) Mr. Dresser gives an interior view of the roof of a temple, showing a mode of construction, said to be very common, where "double king-posts" are employed. Now, if these are so framed as to depend from the rafters and uphold the sagging tendency of the tie-beam, then they are indeed true king-posts. But they have not the appearance of being so; they appear rather as pillars set upon the horizontal beam to sustain the purlins carrying arched rafters. We suspect that this last is the actual construction, and if it is so the structure must depend for its security entirely upon the massiveness of the timbers; and the fact that these timbers are very massive—especially the horizontal beams upon which the so-called king-posts rest—tends to confirm this suspicion. A further indication of the want of constructive sense is afforded by the arrangements of shelves and the manner of supporting them in many Japanese cupboards and cabinets. In these one shelf is often made to rest upon a single slender upright member rising from a shelf below, with nothing whatever to support this lower shelf and its superincumbent weight at the point, or near the point, where the weight falls (see Fig. 106). The strength of such a piece of work depends wholly upon that of the material used and upon a system of grooving and dovetailing, in which methods of joining wood the Japanese are wonderfully ingenious and skilful. But although Japanese building seems often to violate constructive principles, it is yet very curious and interesting in many ways, and especially so, as we have already seen in the case of the pagoda, in its adaptation to meet the earthquake shocks with which the country is frequently visited. Mr. Dresser shows that a house in Japan consists essentially of little more than a roof supported upon upright posts resting loosely upon flat stones; the whole structure being so framed together that in times of earthquake it may freely rock and shift about, as one may cause a chair to do upon an even floor, without harm.

As the temples of Egypt are supposed to have had their prototypes in the reed dwellings of the primitive times, so Mr. Dresser looks for the origin of Japanese forms of building among the abodes of the early Japanese people; and he finds among the present Aino inhabitants of the northern island (Yesso), a people who retain very primitive habits, forms of building which seem to lend plausibility to this theory. Upon this original prototype various outside influences have been brought to bear. The Chinese, the Coreans, and the Buddhist missionaries from Central Asia brought each some new elements of style to Japan. The form of roof seems to have been first derived from that of the rudely thatched Aino Temple, and to have been afterward modified by the Chinese tent-like form—a pole, like the ridge-pole of a tent, with rafters bent in correspondence with the sagging of tent canvas, being characteristic of many Japanese roofs. In the course of his remarks upon the ornamentation of buildings the author reiterates a theory which has found favor in some quarters—namely, that structure must not be falsified by enrichment, and that structural members should be rendered prominent by color and ornamentation. We do not consider this a true theory. We should not, indeed, contend that structure might rightly be *falsified;* but in our view it may, with perfect propriety, be concealed, as it verily is in a vast number of the noblest architectural monuments in the world. And these monuments frequently also contradict the assertion that structural members should be rendered prominent by color and ornamentation—as, notably, in the case of the Parthenon. Moreover, the theory seems wholly to conflict with the principles of decoration in nature.

From the consideration of architecture and ornament Mr. Dresser passes to the subject of drawing and painting, illustrating this portion of his work by a series of woodcuts, executed in Japan, which form a very interesting and attractive feature of the book. Attention is called to the remarkably living character of the Japanese renderings of the forms of birds, animals, and plants. With however few strokes a creature is drawn, its life is unmistakably and admirably expressed. European artists have only in exceptional cases shown the capacity of thus entering into and representing the life of the lower orders of animal being; as compared with the drawings of the Japanese, their creatures are apt to convey more or less suggestion of stuffed specimens. Japanese graphic art is, however, singularly limited. It is never more than sketching. They know nothing of chiaroscuro, and finished forms of painting do not exist in Japan. Moreover, they show a strange incapacity to draw the human figure or the figures of the higher animals with any dignity or truth. Men and horses are generally conceived by them in repulsively grotesque forms—more or less like the representation of the "God of Wisdom" (Fig. 146, in this book.

The account given of the method of drawing with the brush held at arm's length is suggestive and instructive; but some remarks upon the character of angularity in Japanese drawing lead the author into too sweeping and short-sighted generalizations respecting the value of angularity as a method. He says (p. 286), "Rounded lines, if used in a sketch, generally produce feebleness of effect; whereas, angularity in drawing gives vigor and life." Now, this is a profoundly untrue and misleading statement. Rounded lines by no means necessarily produce feebleness of effect, nor is angularity any more expressive of vigor and life than it is of the opposite of these. Indeed, a moment's attention will show, we think, that the angularity of the example (Fig. 125, which is especially praised for this quality) has a precisely opposite effect from that which our author supposes, and that what life there is in the drawing is secured wholly by the character of the curves. In the leaves of the plant represented in this figure, the curves of nature are, in many places, reduced to sharp angles, and the effect produced is really as if the leaves were broken. Of course, where any tendency to angularity occurs in living objects, the expression of life requires the due rendering of this quality as much as that of curvature. But this is very different from changing the curves themselves into angles. In nature, angles are constantly associated with curves, and if this fact is overlooked, and curves are given in place of the angles, feebleness will result in the drawing, it is true. A tendency thus to overlook the angles by which nature's curves are foiled has been common with weak draughtsmen, and this practice may well be spoken against; but, by the theory of Mr. Dresser, the fault is not corrected: another fault is simply introduced. That is, where in the one case the angles of nature are rendered by curves, in the other the curves of nature are rendered by angles.

This mistaken theory about angularity is a somewhat common one. It has grown out of a comparatively recent Continental method of elementary instruction in drawing, where curves are resolved into systems of right lines and angles as a means of making them more tangible to beginners. The method has gradually crept up into the more advanced practice of art students and artists. It is a good method if not carried too far, but it is carried too far when angularity is regarded as a permanent substitute for curvature. When the method is rightly employed, the right lines and angles are used in order that the true character of the curves may be more surely attained—that is, they are used *for the sake of the curves.* But the method is wrongly employed when the curves of nature are sacrificed to it. The fallacy of our author's dictum on this point may be further shown by a consideration of the character of delineation among the Greek and Italian designers. With them there are no instances of the slightest approach to this angular method. On the contrary, they draw everything that in nature is curved in "rounded lines," the vigor and life of nature being expressed, in the only way that they really can be, by strict attention to the varying characters of the curves (compare Fig. 125 with any photograph from a drawing of plant form by Leonardo da Vinci). An examination of the vast collection of Greek vases in the British Museum, and of the drawings by the old masters in Florence, will show that this is absolutely so. Allied to the method of reducing curved lines to angular ones in drawing, is that of reducing curved surfaces to planes in sculpture. This also may be useful during the progress of a work; but it may be instructive to consider that the example of the great sculptors of the past lends no support to it. The various unfinished marbles of Michael Angelo in Florence, for instance, show that he never "blocked out" his work in that way, but that he even roughhewed the stone in rounded masses.

Mr. Dresser has an instructive chapter on "Analogies and Symbols," in which he discusses the question of the derivation of ornamental styles, and makes some good remarks about the value of decorative forms as means of arriving at more exact knowledge respecting the affinities

of races. And there are several chapters on the manufacture of Japanese lacquer ware, pottery, metal work, and textile fabrics. The volume is a square octavo, and is handsomely printed.

MORISON'S MACAULAY.—II.

Macaulay. By J. Cotter Morison. [English Men of Letters Series.] London: Macmillan & Co.; New York: Harper & Bros.

Mr. Morison's original, subtle, and profound criticism of Macaulay has rendered one great service to all intelligent readers: it has clearly defined the true issues which must be decided before a settled opinion can be formed on Macaulay's place in literature. These issues are, to state the matter broadly, twofold:

First. Did Macaulay succeed in carrying out his own idea of the task to be performed by an historian? His conception of his work is in the main clear. He was, above all things, a man of letters. Literature was the art to which he was devoted with passion; history was to him the grandest and most impressive branch of literature. History was, in his judgment, the narration of past events. That man was the greatest and most perfect historian who could tell the tale of the past at once with such truth and with such force of imagination as to bring the story of bygone ages actually before the eyes of modern readers. The historian was an artist engaged in painting a series of literary pictures which differed from the creations of the historical novelist in the fact that they were true, and, because of their truth, surpassed the interest of the most interesting romance. In this point of view, the passage from Macaulay's letters which has made a far too unfavorable impression upon Mr. Morison has great importance:

"I have at last begun my historical labors. . . . The materials for an amusing narrative are immense. I shall not be satisfied unless I can produce something which shall for a few days supersede the last fashionable novel on the tables of young ladies."

Remember that this language is used in the letter to a friend; it has, and is intended to have, a tone of epistolary *badinage.* You must not take a joke seriously. When these allowances are made, it is easy enough to see that Macaulay's language conveys in a light form his conviction that truth properly told was full of interest, and that he possessed the power to tell the tale of English greatness so that it should entrance others as it had throughout his life entranced himself. This was the aim of his labors. It is, we think, impossible to read either Macaulay's works or Mr. Morison's criticisms without seeing that in the main Macaulay succeeded in the attainment of his object. The worst defect which, from his own point of view, can be fairly laid to his charge is excessive diffuseness. He assuredly planned an edifice which under no possible circumstances could he have brought to completion. This want of the power duly to measure out his work is characteristic of the generation among whom Macaulay lived. It is due, no doubt, in a measure to his overweening desire that his narrative should be absolutely clear and intelligible to every reader. Still, make what excuses one will, a tendency to diffuseness is a charge from which Macaulay cannot be acquitted. But the other accusations pressed by Mr. Morison—namely, want of generalized and synthetic views and deficiency in the historical spirit—are rather charges against Macaulay's whole theory of history than just criticisms on the mode in which that view is carried into execution.

"He has not," Mr. Morison urges, "grasped and reproduced in well-weighed general propositions the import and historical meaning of the Stuart period, which was his real object; he has painted many phases of it with almost redundant fulness, but he has not traced the evolution of ideas and principles which mark its peculiar character."

These remarks are in themselves perfectly just. There is more to be learned about the "evolution of ideas and principles" from sixty pages of Gneist's 'Englisches Verwaltungsrecht' than from the whole of Macaulay's five volumes. But Macaulay's object was not the same as the object of Gneist. A picture is a good thing, and so also is a map; but it is vain to complain that a splendid picture has not the merits of a map. So, again, with regard to the censure on Macaulay for constantly comparing the past with the present. Such comparisons have in his writings a distinct aim: their object is to make the past intelligible to modern readers. There is no more effective way of achieving this end than by contrasting things as they were with things as they now are. To tell us that in Tunbridge Wells "we see a town which would a hundred and sixty years ago have ranked in population fourth or fifth among the towns of England; the brilliancy of the shops and the luxury of the private buildings far surpass anything that England could then show"—is surely to convey in a vivid manner real and valuable information. It impresses on even the most careless student the fact that the England of Cromwell and of the Stuarts was a country of what we should now call small towns and scanty population. That this was so, no one can doubt; but there is probably not one in a thousand readers who does not constantly require to have brought home to him in a form which he can neither misunderstand nor forget, how different was the England of the seventeenth century from the England of to-day. Mr. Disraeli was a man not wanting in intelligence. When an opponent asked, "Where are now the thousands of freeholders who came from Buckinghamshire at the call of Hampden?" Mr. Disraeli retorted, "They are where I should expect to find them—in Buckinghamshire"; and if the Tory leader was not imposed upon by his own smartness, his followers certainly thought the reply conclusive. They never reflected for a moment that the men who rallied round Hampden were a very different class and of very different political weight from the freeholders whom Mr. Disraeli found it convenient to treat as their representatives.

Secondly. What was the worth of Macaulay's conception of history? On the answer to this inquiry the battle between Macaulay's assailants and his admirers will ultimately have to be fought out. The reaction against Macaulay is mainly due to the growth and prevalence of two views of history which are radically opposed to, or at least essentially different from, the conception of history adhered to by the last, and all but the greatest, of historical narrators.

Carlyle and his school have (consistently enough with their general views of life) treated history as, so to speak, a branch of ethics. No doubt Carlyle's 'French Revolution' is as brilliant a piece of imaginative painting as has ever been produced. But no one can believe that Carlyle's main object was to produce a narrative of the events about which he writes. His true, one might almost say his avowed, aim was to take the Revolution as a text from which to preach the truths or dogmas of which he was the prophet. No reader can forget the time when he first read the description of Louis XV.'s death; it is, in its way, the grandest historical sermon ever preached. But it is, after all, a splendid sermon, not a chapter of history. Now, Macaulay is fond, and a good deal too fond, of certain kinds of exposition; his whole genius is that of a narrator. He tells his tale for the sake of telling it. He has no new morality, no truths, to preach; and students whose real interest in historical study is not the knowledge of facts, but the supposed lessons to be drawn from them, are indignant when an historian persists in keeping to his duty as a narrator, and does not assume the attitude of a moral teacher. Yet, can any one who really cares for the progress of knowledge doubt that Macaulay's treatment of history is, to say the least, far more sound and healthy than the mode in which it is treated by Carlyle? The first requisite for successful research, in whatever field, is, that it should be disinterested; and the author who surveys the annals of mankind in order to find texts in support of a theory will, no doubt, find texts enough. But he is very fortunate if he finds anything else, and it is all but certain that he will misunderstand the texts themselves. Carlyle's 'Cromwell' is probably the contribution of most permanent value made by him to the study of history. The collection, publication, and careful editing of a mass of neglected documents can never fail to promote knowledge. But even now the moralizing and the preaching of the editor might with great advantage be excluded from Carlyle's edition of Cromwell's speeches and letters. If there be anything really unhistorical, it is the encumbering and interlarding of original speeches and writings with editorial comment. Already a good deal of the Carlylean commentary is completely out of date, yet Carlyle was a writer of genius and imagination. One trembles to think what would become of historical study if he had produced, or was likely to produce, a large body of followers. Macaulay may be a mere narrator, but a story-teller who tells truthfully and vividly the transactions of bygone ages is, in the long run, a far more useful guide to the knowledge of the past than can be any moralist, however elevated his doctrine, who is trying to use the past for the purpose of present edification and improvement.

If the admirers of Carlyle or Froude find Macaulay deficient in moral tone, earnestness, insight, sympathy, and the like, both Macaulay and Carlyle fail to satisfy critics who look upon history as a branch rather of science than of literature. He has not traced the "evolution of those ideas and principles" which mark the period of the Stuarts with its peculiar character. We have already admitted that this charge is true; we may further admit that Macaulay would have stood in a far higher place than he will ever occupy if he had added to his extraordinary powers of narration that gift of historical analysis or capacity for tracing the evolution of ideas and principles which is exhibited by such writers as Gneist or De Tocqueville. But critics often appear to assert, as Mr. Morison's tone occasionally seems to suggest, that an author who does not trace out the growth of ideas hardly deserves to be called an historian, and certainly has neglected one, if not the chief, of an historian's duties. Now, to the truth of this assertion we distinctly demur. A writer who brings before us a true picture of the past performs a service the importance of which can hardly be exaggerated. Generalizations about the past, the evolution of ideas, the history of the growth of principles, and the like, are in their way things of great interest and importance, but they are almost unmeaning to a student who has not before his mind the facts of the age to which the generalizations refer, or in which the ideas grew up. It would, for instance, be all but impossible for any one to read with profit De Tocqueville's 'Ancien Régime' without some clear conception of the history of France. It would certainly be very unprofitable to read about the growth of ideas under the

Stuarts without some knowledge of the events, say, of the Rebellion and the Restoration. Macaulay, and writers like Macaulay, do not, it is true, explain the past, but, when successful, they do what is even more essential—they show us the past. Nor is narrative of value merely because it enables us to appreciate historical speculation. Theories about history, however ingenious and however profound, are always transitory; they represent the knowledge and ideas of the age in which they grow up. Narrative is, in so far as it is true, the very basis on which such theories of history depend. There is no need whatever to depreciate authors who undertake to analyze the causes which have produced a given state of society. The field of historical investigation has room enough for the employment of every kind of talent. We need investigators, we need critics, we need narrators; each class deserves its appropriate praise. But there is at the present moment some real danger lest the importance of narration should be underrated; and as long as the tendency to such an underestimate of one form of history exists, it is certain that ordinary readers will hardly rate at his full worth the writer whom Mr. Morison has pronounced one of the best, if not *the* best, of all historical story-tellers.

BOLLES'S FINANCIAL HISTORY OF THE UNITED STATES.

The Financial History of the United States from 1789 to 1860. By Albert S. Bolles. D. Appleton & Co. 1883.

THE financial history of the United States possesses great interest for all who are disposed to give sober study to economic or political subjects. It is, however, a very difficult subject to treat. The material with which the historian has to deal is very hard and stubborn. If he does not go into a certain detail of dates and figures, he does not fairly state the matter; if he tries to generalize and summarize, he loses the finer traits of the history in which its chief interest and value lie; if he goes into statistical and historical detail, he becomes very dry, and he exhausts the patience of the reader. We had good hopes of Mr. Bolles's second volume. He has, indeed, studied carefully, and he gives the results of his study with fidelity; but he does not seem to us to have hit that proportion of parts of his subject which was desirable, and he has not given to his book the animation which was necessary to render its theme attractive. If we are not mistaken, there are elements of almost romantic interest in the financial history under discussion, but it would require especial tact and skill to bring them out. Mr. Bolles so arranges his essay that he goes over the same ground a number of times—a mode of treatment which must, we think, distract and tire his readers. Under it, the crises of 1819 and 1837 sink into insignificant incidents. Would it not be the true mode of making the subject interesting to hold these two periods as great centres, to and around which the course of events should be traced? We have also been astonished to notice how entirely the Bank of the United States fades into the background, and how, in general, the banking and currency history is made secondary. The story of the Bank of the United States is a drama, almost a tragedy, by itself, and the banking and currency history deserves study, and would excite interest.

Mr. Bolles takes that view of Hamilton and Gallatin which is rapidly winning the suffrages of all modern students of our history. He thinks that Jackson was a mischief-maker. He does not, however, enter into any detail of the political history. His method leads him to neglect the mutual relations of currency and tariff, and he does not take much notice of the connection of both with politics. Speaking about the most important occasion on which financial legislation reacted on politics—the nullification struggle—he says: "A force bill, as it was called, was speedily enacted; but the South Carolinians, seeing the strong arm of the Government uplifted to vindicate the laws, suddenly changed their purpose, the nullification ordinance was repealed as hastily as it had been passed, and tranquillity was restored." This cannot be allowed to pass as a correct description of the events to which it refers. It takes no account of the compromise tariff which was passed with the Force Bill, and before the nullification ordinance was repealed.

It is in the case of the history of the tariff, however, that the book has surprised and disappointed us. In the more strictly financial parts of the book we have wondered at the author's selection of topics, and have asked ourselves again and again what had become of those which we regard as of commanding interest. Also, it has seemed to us that, although he had gone over all the ground with fidelity, he had failed to master it; nor do his critical remarks appear to be strong or always correct. But when we come to the tariff, it is evident that the author has not reached a positive conclusion, or else that the limitations of a professor in the Wharton School of Finance and Economy have crippled him to the point of helplessness. To profess a science in a school which has a scientific creed has always been found incompatible with sound scholarship. There is an impression in the minds of many that in Pennsylvania the college trustees find out what is true in political economy, and then hire professors to teach it. We did not suppose that Mr. Bolles was just the kind of man for such a position, but we are shut up, for the explanation of his treatment of an important subject, either to his imperfect mastery of it or to the necessities of his position.

He correctly explains the origin of the tariff in 1789: "Home manufactures were encouraged, not solely to get them cheaper, either immediately or prospectively, but because revenge was sweet, even if purchased at considerable cost to the avenger." He, however, passes no criticism on this policy of vengeance. He takes no account of the state of the currency under the Confederation, or of the effect which the disordered currency had on trade, and the fallacies about foreign trade to which it gave encouragement. Here and elsewhere the current fallacies about "overtrading" and the balance of trade and the drain of specie are repeated by him as correct and satisfactory explanations of events. "The destruction of our credit, therefore, was a blessing to the home manufacturer." The manufacturers appear throughout Mr. Bolles's history like the English landowners in the old Corn-Law times—always prospering by the calamities of others, and never able to succeed if other people are well off. On page 86, Mr. Bolles quotes a silly old story about two machines which were bought and carried away by British craft in order to ruin American industry. We do not understand how anybody who has ever studied political economy can believe or seriously repeat such a fiction. It must be that there was no one in Philadelphia patriotic enough, or with business energy enough, to bid up the price and keep the machines. Instead, they raised a wail because there was no law as yet to enable them to raise, by taxes on somebody else, enough to buy the machines and keep them in Philadelphia.

Mr. Bolles regards the embargo and the second war as having been "salutary" in that they forced manufacturing here. How great, then, would have been our calamity if there had been peace, quiet, and prosperity from 1805 to 1815! He thinks that "auctions" were "the most powerful adverse influence to manufacturing." He speaks of them as "forcing goods into the market beyond the actual wants of the people" (p. 388). He speaks of "waves" of imports which overwhelmed the American producer in 1817 and 1818. He believes that when the home producer was crushed the foreigner immediately raised the price (p. 369). He repeats the apocryphal quotation of Lord Brougham, that American industries ought to be strangled. He quotes a foolish argumentation of Mallory on the question whether tariff taxes fall on the consumers, and also one of Rush's model sophisms on the question whether tariff taxes raise prices (p. 398). He appears to be satisfied with an argument which he quotes from Appleton to prove that the Southerners did not "exchange cotton for manufactures" (p. 421). He puts himself in the attitude of the manufacturers who pointed to decline in prices as proofs of calamity and bad legislation, although, as above stated, he appears also to side with those who hold that tariffs lower prices (p. 427). To him, therefore, decline in prices under lower taxes seems to prove that the taxes ought to be put on again, not that they never should have been put on. He speaks of the United States as "the emptying-ground for the foreign manufacturer," who made use of auctions to "push off" his goods (pp. 429, 459). We can understand that the American producer did not like that, and we can see how it was likely to ruin the Englishmen, but the American consumers must have revelled in abundance. He tells us—a fact which we had never known before—that in 1841 the cotton and woollen manufacturers conspired with the New York Custom-house officers "to check importations by increasing the prices of invoices, and seizing goods, and subjecting importers to unexpected annoyances" (p. 431). Hitherto we had heard only of "fraudulent invoices," etc., devised by importers to defeat the protective system.

Mr. Bolles regards the tariff of 1842 as a model, and boldly faces the problems which his admiration of it arouses. His solution, however, is more trenchant than adequate (p. 446). The tariff of 1846, of course, he regards as a lamentable mistake. He takes no notice of the effect of the repeal of the Corn Laws on this country, although that was undoubtedly the most important event in the history of our tariff, on account of its effect upon the profits of our agriculture, and on the comparative profits of our industries, and on the distribution of our population; but he regards the Irish famine as having been a piece of good luck for us. That, and the discovery of gold in California, which provided means to meet the "drain of specie" to pay for over-importation, saved us from the consequences of our folly in the tariff of 1846.

We can only say that all this seems to us to furnish a striking illustration, how possible it is to study history without learning anything from it.

Oddities in Southern Life and Character. Edited by Henry Watterson. With illustrations. Boston: Houghton, Mifflin & Co. 1883.

THIS compilation from the works of Southern humorous writers has been made with judgment, and was worth making. Its historical value, both in a social and a literary point of view, is considerable, and it will be found interesting even (as in "Major Jones's Travels") where it is far from being amusing. Every one must admire the exquisite art of "Uncle Remus," and admit the cleverness of the authors of "Sut Lovingood" and the "Dukesborough Tales," while Judge Longstreet's "Georgia Scenes"

will always remain a respectable Southern classic. This is but a glimpse of the contents of Mr. Watterson's volume, which does not profess to be encyclopædic, and yet is liberal enough to include in its selections such waifs as Congressman Knott's famous Duluth speech, Prentice's Louisville-*Courier* squibs, and the anonymous "Harp of a Thousand Strings." Prefatory notices tell us something of the several writers and of the dates of their works, though less than would content the bibliographer. From these it becomes apparent, before Mr. Watterson points out the curious fact, that Georgia has been more prolific in humorists—and among them the very best—than any other part of the South.

One quickly discovers here the sources of a large share of the Americanisms in Bartlett's Dictionary, and sometimes catches a locution in the very act of forming, as when Davy Crockett says: "'Let us hear the colonel,' cried another; and so I *mounted the stump that had been cut down for the occasion*, and began to bushwhack in the most approved style." But, however curious the dialectic peculiarities thus revealed, the social conditions far surpass them in interest. No one can doubt the essential truthfulness of the portraiture of character and manners to which so many writers have contributed, with so much mutual confirmation. We have under observation an agricultural, slaveholding, frontier, land-speculating, and more or less lawless and violent community in the days before the war. The *dramatis personæ* are for the most part illiterate, coarse, and, on occasion, brutal. The book opens with the private rehearsal, as an interlude in ploughing, of "all the parts of all the characters in a Courthouse fight," by a youth who "was jist seein' how I could 'a' *fout*," and this is succeeded by a sickening account of a real encounter between neighborhood bullies. Nothing, again, is more striking than the unconscious incidental record of slaveholding commonplaces. Take, for instance, the sequel to the surreptitious game of cards between Simon Suggs and the colored boy, Bill. The scene is under a mulberry tree (p. 45):

"The old man Suggs made no remark to any one while he was seizing up Bill—a process which, though by no means novel to Simon, seemed to excite in him a sort of painful interest. He watched it closely, as if endeavoring to learn the precise fashion of his father's knot; and when at last Bill was swung up a-tiptoe to a limb, and the whipping commenced, Simon's eye followed every movement of his father's arm; and as each blow descended upon the bare shoulders of his sable friend, his own body writhed and 'wriggled' in involuntary sympathy."

Or take this camp-meeting scene (p. 63):

"'Dear soul alive! *don't* he talk sweet?' cried an old lady in black silk. 'Whar's John Dobbs? You Sukey!' screaming at a negro woman on the other side of the square, 'ef you don't hunt up your Mass John in a minute, and have him here to listen to his 'sperience, I'll tuck you up when I git home and give you a hundred and fifty lashes, madam! see ef I don't! Blessed Lord!' referring again to the Captain's relation, 'aint it a *precious* 'scourse?'"

The South has moved away from this condition—legally, if not altogether spiritually; and absolutely from the point of view contained in the following extract:

"'No! but,' ses the old man, 'they 've got plenty of white servants at the North, what you can hire for little or nothing.'

"'Goodness gracious!' ses old Miss Stallins; 'white servants! Well, the Lord knows I wouldn't have none of 'em 'bout me.'

"'Nor me, neither,' ses Mary. 'It may do well enuff for people what don't know the difference between niggers and white folks; but I could never bear to see a white gall toatin' my child about, and waitin' on me like a nigger. It would hurt my conscience to keep anybody 'bout me in that condition who was as white and good as me.'

. . . . . .

"'But,' ses Mr. Mountgomery, 'they're brung up to it.'

"'Well,' ses Mary, 'the more sin to them that brings 'em up to be servants. A servant, to be any account as a servant, has got to have a different kind of a spirit from other people: and anybody that would make a nigger of a white child because it was pore, hain't no Christian principles in 'em.'"

The survivals at the South of the social life depicted in this book are probably more numerous than any one imagines, though their range is constantly narrowing. We shall point to one which has been much discussed of late in our columns, and for which many explanations have been offered, "the war" and "reconstruction" included. The Southern testimony about to be cited is taken from the chapter on "Flush Times," the period in question being about the year 1836. The statement is general for the Southwest, and the italics are the author's (p. 104):

"Occasionally the scene was diversified by a murder or two, which, though perpetrated from behind a corner, or behind the back of the deceased, whenever the accused *chose* to stand his trial, was always found to be committed in self-defence, securing the homicide an honorable acquittal *at the hands of his peers*."

We should be misrepresenting 'Oddities in Southern Life' if we conveyed the impression that its seriousness was greater than its drollery. The reverse is the case.

How to Succeed: In Public Life, as a Minister, as a Physician, as a Musician, as an Engineer, as an Artist, in Mercantile Life, as a Farmer, as an Inventor, and in Literature. A Series of Essays by Senators Bayard and Edmunds; Drs. John Hall, Willard Parker, and Leopold Damrosch; Gen. Wm. Sooy Smith, W. Hamilton Gibson, Lawson Valentine, Commissioner Geo. B. Loring, Thomas Edison, E. P. Roe, and Lyman Abbott. Edited, with an Introduction, by the Rev. Lyman Abbott, D.D. [Handy-Book Series, No. 26.] G. P. Putnam's Sons. 1882.

THE title of this handbook, on the subject of success in life, gives a fair idea of its contents. Considering, however, the interest of the subject, the volume is rather disappointing. A great deal of it consists of moral advice, of a sort which children get in the nursery and in church (many of the articles first appeared in the *Christian Union*); and a critic may fairly suggest that success in life is not usually among moralists regarded as a safe motive for compliance with the moral law. The world is full of successful men who are by no means examples of a strict attention to duty, but, on the contrary, neglect many plain duties altogether. Dr. Abbott and many of his contributors do not seem to be aware that in each profession or occupation there are special virtues which lead to success, and, at the same time, vices which do not seriously interfere with, or which even aid, it. A man may make a great success as an advocate, for instance, and be a complete spendthrift: Webster and many other lawyers are instances of this. Again, a man may succeed in the dry-goods business, and yet be mean, ignorant, and unjust to his family. A man may succeed as a quack through the aid of stupendous lying. The only reply that can be made to this is that these are not cases of "true success," or "Christian success"; and Dr. Abbott seems to vacillate between this view of the matter and a belief that a real Christian will always obtain a complete worldly success. To show that we do him no injustice in saying this, we may quote one or two of his remarks: "The precepts of the New Testament are good as social, business, and political principles"; "There is no chart of sailing directions so good to steer by for the port of success as those to be gathered from the instructions of Jesus of Nazareth"; "The golden rule is a good rule to do business by." In other words, worldly prudence teaches us the same lesson as the Gospel. This is queer doctrine to hear from a minister, and it is not surprising to find Mr. Bayard, in his contribution on public life, insisting that obedience to "duty," rather than the attainment of success, is what ought to be held up to young Americans. Christianity was certainly not preached by Christ as a good "paying" or "business" faith; indeed, from a worldly point of view, the career of the founder of the faith and his immediate disciples cannot be regarded as successful at all.

An Illustrated Dictionary of Words Used in Art and Archæology. By J. W. Mollett. Boston: Houghton, Mifflin & Co. 1883. Pp. 350.

THIS is a handy and useful but badly edited book. Its genesis reminds one of the jack-knife which first had its blades replaced and then its handle. It was begun as an amended edition of the dictionary composed by a French architect, M. Ernest Bosc; but, while his 450 engravings have been retained and added to, "little or nothing of the text has been left standing." Terms of architecture, painting, engraving, military science, and antiquities; the names of garments, of ceramic wares, of woods, of stones, of musical instruments, of heraldry, etc., etc., constitute the bulk of the present work. Sometimes, as under *Etching* and *Wood-engraving*, there is, besides the mere definition, some account of processes. In general, however, the notices are very brief.

The want of consistency is the most striking feature of this dictionary, which could not, of course, be exhaustive. Typography is not ostensibly included in the editor's scheme; then why insert *Pica* type, and omit bourgeois, brevier, nonpareil, and the rest? Music is likewise not professedly regarded; yet we find *Largo*, with the definition: "a slow movement, one degree quicker than *adagio*." But what does adagio mean? It will be sought for in vain under A, as will also andante and allegro, and we have discovered no other corresponding term. So we have *Clef*, but no staff. Astronomy, again, is out of range; still, here is *Perigee* without apogee, and *Perihelion* without aphelion. Similarly, *Heliochromy* is admitted, but not heliotype, and but a small and arbitrary number of the various photo-engraving processes. *Millstone-grit*, "the name of a good building-stone, plentiful in the north of England," is thought worthy of a place beside marble, porphyry, etc., but granite and sandstone are overlooked. A different sort of partiality is shown in giving a separate entry to *Victoria Cross*, and to but one other of the varieties mentioned under the general title, *Cross*.

The vagueness of the "archæology" contemplated by the editor gives rise to many ludicrous surprises as well as unaccountable omissions. We can easily count on our two hands all the vulgar names of flowers we have encountered in searching these pages. The field is one which, in our opinion, should have been avoided; but having strayed into it, ought Mr. Mollett to have slighted, say, jack-in-the-pulpit or dead-men's-fingers in order to explain *Love-lies-bleeding* and a very few others? The climax is perhaps reached in "*Dog's-nose:* a cordial used in low life," which no one in the wide world, we venture to say, would have dreamed of looking for in a 'Dictionary of Art and Archæology.' Sack, by the way, is not recognized. It seems, on the

other hand, a poor tribute to the intelligence of the reader that he should need a definition of *Bower* in its older sense. But what, then, shall be said of volunteering information about *Epoch*, *Knapsack*, *Oasis*, *Opacity*, or of inserting *Figure-paintings* only to define them as "paintings of the human figure"?

These defects in plan and execution are far from depriving this dictionary of all utility. They will as often amuse as disappoint. The illustrations are numerous and extremely good, but space would have been gained by not repeating them, though this practice has its convenience. That the common frog, apart from any artistic or archæological association, should have been depicted (p. 147), is only another instance of the freakishness which we have already exemplified.

The Life and Letters of Elizabeth Prentiss, author of 'Stepping Heavenward.' New York: Anson D. F. Randolph & Co.

No one can read with indifference the story of a life so singularly fortunate in its opportunities as that of Mrs. Prentiss, and no one can read without profit the record of her beautiful and untiring use of those opportunities. The letters and journals have something of the exquisite sweetness of Eugénie de Guérin's. And why should they not? 'The City of God' and the 'Imitation' were daily food alike to Calvinist and Romanist. Both read long and often from Fénelon, and what the one found in the 'Sacra Privata' and the 'Christian Year,' the other sought in the 'Lives of the Saints' and the 'Month of Mary.' Each life, in its piety, bears witness to the essential oneness of Christian faith—the living as seeing the invisible.

Mrs. Prentiss's books are not likely to be forgotten. Their simplicity and their truth to the types she chose to portray place them far above the majority of the Sunday-school books among which they belong. She had a reality about her, a sense of the fitness of things, which kept her safe alike from platitudes and from morbid exaggerations. She might have succeeded in other fields of literature, though her own single-eyed, religious, yet always most humble, purpose could never have admitted them as higher or wider. The little book, 'The Story that Lizzie Told,' a sketch of the flower-fête of the poor children in the Dean's garden at Westminster, shows what her power could have been.

A smaller volume than the present biography might have reached a greater number of general readers, but in the circles for which it was especially intended there will not be a page too many. As to plan and execution, it is not too much to say that it is faultless.

BOOKS OF THE WEEK.

Adams, Mary. An Honorable Surrender. Charles Scribner's Sons. $1.
A Kempis, Thomas. Of the Imitation of Christ. Parchment edition. D. Appleton & Co. $1 25.
Amos, Prof. S. The Science of Politics. D. Appleton & Co. $1 75.
Baring-Gould, S. The Vicar of Morwenstow. Fourth Am. edition. T. Whittaker. $1 25.
Bolles, Prof. A. S. The Financial History of the United States from 1789 to 1860. D. Appleton & Co. $3 50.
Butt, Beatrice May. Geraldine Hawthorne. New York: Henry Holt & Co. $1.

The Nation.

NEW YORK, THURSDAY, MARCH 8, 1883.

The Week.

THAT the Tariff Bill was a game of grab played on a large scale, is made apparent by the cries of those participants who lost more than they gained by it. There is a knot of iron and steel-mongers in Pittsburgh who appear to be in a state of extreme exasperation toward Mr. Kelley, of Pennsylvania, and Senator Morrill, of Vermont, who, they say, sacrificed their principles. This appears to be the view also of Mr. Henry Carey Baird, of Philadelphia, who is reported as saying "that the bill is a surrender on the part of men professing to be protectionists; a sort of peace offering to the free foreign traders; a surrender of the outworks which those people have refused to accept." The meaning of all this is that genuine protection, of the simon-pure brand, is the highest rate of duty, on every article, that anybody wants; and that anything short of this is a surrender of one's principles to the "free foreign traders." The hoop-iron, cotton-tie, and tin-plate makers wanted something which they did not get; therefore the outworks of our national defences are gone. We must say that, while there is something ludicrous in the spectacle of Mr. H. C. Baird assailing Mr. Kelley for unfaithfulness to the doctrines of protection, there is nevertheless some logical force in Mr. Baird's position. Protection means keeping the hated foreign thing out of our markets. If it does not do this, it is only half-protection, quarter-protection, fractional protection. But if we leave it to an ignorant or ill-informed Congress to fix and determine what these fractions shall be, how can we expect anything better than these blundering bills?

The general aspects of trade in the United States have improved somewhat in several respects in the last ten days. One of the principal items is a greatly increased movement of grain, cattle, and hogs into the principal Western primary markets. This indicates an increase in the volume of all other mercantile and industrial business at the West. The adjournment of Congress has also removed one cause of uneasiness, especially in the iron trade. The anticipations of reductions in the tariff do not seem to have had a very depressing effect on the importations of foreign goods, as we find that the amounts of imports at the port of New York in the week ending February 24 were $4,502,568, against only $2,149,123 in the preceding week, and that the amounts withdrawn from warehouse and thrown upon the market showed an equal increase. Exports of breadstuffs keep up well, and by the latest report of the Bureau of Statistics it is shown that in the four months ending January 31 the value of our exports was $92,749,136 in excess of the value of our imports. It now begins to appear that, in consequence of this large trade balance in our favor, the movement of specie from London to New York in the near future is not improbable. On Monday and Tuesday, March 5 and 6, £200,000 of gold were withdrawn from the Bank of England for export to America; and though rates of foreign exchange were not down to the figures generally assumed as the "gold-importing point," it is asserted by some of the most prominent drawers of foreign bills that, in view of the low rates of interest in London and the higher rates here, the specie could be imported, even at Tuesday's rates for exchange, without loss. The rates of interest for money in all American markets have been hardening for the last ten days. The rates for discount of mercantile paper in New York have advanced 1 per cent. in the last week, and are now 6½ and 7½ per cent. for discounts of prime single-name paper, against 5½ and 6½ a week ago. The advance in rates for money has had a depressing effect on the stock market; but on the other hand, the probable imports of specie, which will be influenced by the higher rates for money, will probably have the effect to advance prices ere long. As compared with a week ago, the general list of active stocks on the market has advanced an average of 3 per cent.

For some time it had been rumored that the Mikes, and Barneys, and Clints, and John F. Smyths were determined that so impracticable a civil-service reformer as Mr. Burt, of the Naval Office, must no longer be permitted to hold an important place in the Custom-house. But it was supposed that the President, who professes to be a civil-service reformer himself, would easily see the desirability of having a man of Mr. Burt's stamp in just such a position of practical administration to serve as a model and a guiding influence, and that the urgency of the Mikes and Barneys would be harmless. But, in fact, Mr. Burt's position has been given to Mr. Graham, who, without disrespect be it said, does not equal, far less excel, him in official efficiency. Mr. Burt was at the same time nominated for the Chief Examinership under the Civil-Service Commission. This is an honorable place, and Mr. Burt was unquestionably well fitted for it. But the President himself must have doubted very much whether Mr. Burt would be able to take it. The salary of the Naval Officer is $8,000; that of the Chief Examiner is $3,000. Mr. Burt has a family, but no fortune. To accept an office which involves a reduction of income from $8,000 to $3,000, and at the same time a change of residence, without permitting the making of an additional income by outside activity, is to such a man a difficult if not an impossible thing. The President ought to have known that. If he did not, a simple telegraphic despatch would have brought him the information in half an hour. The upshot is, that while Mr. Benedict, Mr. Graham, and Mr. Wickham are promoted to higher places, and others, such as Mr. Tate and Mr. Smart and Mr. Root, to honorable positions from private life, Mr. Burt, the best, and in fact the only true civil-service reformer of them all, is "promoted" out of the service. The offer of the Chief Examinership is so thin a disguise of the determination to get rid of him that it rather aggravates than mitigates the discreditable character of the act. The sincerity of the President's civil-service reform professions has been very seriously put in question by himself.

Speaker Keifer was determined to make his mark once more before he left the scene. Just before the expiration of Congress and of his power as Speaker he asked one of the shorthand reporters, Mr. Tyson, to resign, so that he (Mr. Keifer) might put his own nephew into his place. Considering that the period of very severe work was just closing, and that the shorthand reporters of Congress would now have a somewhat comfortable time until next December, Mr. Tyson thought it hard that he should give up his place for the time when the salary would be easily earned, for no other purpose than that Mr. Keifer's nephew might enjoy it as a sinecure. But Speaker Keifer insisted, and threatened to remove him if the resignation did not come forth. Then Mr. Tyson resigned under duress, and Mr. Keifer's nephew was put in, to get during the summer a handsome salary for doing little or nothing. This is about as scandalous a thing as can well be imagined. But, after all, it must be recognized that Mr. Keifer went about it in the bluff, frankly brutal manner of a man who has nothing to conceal. And in this respect we rather prefer his straightforward, highwayman-like style of accomplishing his purpose to the circuitous, hypocritical trick by which Mr. Burt was eliminated from the service. Mr. Keifer did not know that he ought to have been ashamed of what he was doing. But the manner in which, in obedience to the "boys," Mr. Burt was ejected from his place, showed that the President actually was ashamed of what he was doing, though he still did it.

We pay close attention to all Stalwart gatherings, club-meetings, dinners, "banquets," reunions, and the like, and read all Stalwart letters, speeches, and addresses carefully, for the purpose of finding out what a Stalwart is, and what he thinks or desires, but thus far in vain. We pay special heed for this reason to the utterances of the Rev. Dr. Newman, the Stalwart chaplain, including even his sermons, knowing him to be an effusive and genial divine, who is apt to blurt things out when he feels in good spirits; but on this point he is dumb as a tombstone. At the dinner of the Lincoln Club, the other day, we felt sure the secret would slip out, but it did not. The speakers all avoided it, though there were numerous obscure allusions to it. The "Grant Club," an Albany Stalwart institution maintained by the estimable John F. Smyth, had a dinner last week, at which many letters from distinguished absentees were read, but they were all absolutely discreet. Mr. J. Howard King called on the Stalwarts to "close up their record, inscribe 'forgive and forget' on their banners," and "turn attention

to the old-time enemy," but gave no reason for recommending this truly mysterious behavior. Mr. George Bliss—*the* George Bliss—hoped "the occasion would lead in some manner to the reuniting of the Republican party," but did not say in what manner. Mr. Martin I. Townsend said "his heart would be with them," but did not say what about. Mr. Roscoe Conkling was more hidden and mysterious than any of them. He said it was pleasant to know that they were "tried and true, and steadfast in the faith," but did not say what "the faith" was. It may, for aught we can tell, be faith in John F. Smyth. He also remarked that the Grant Club can say: "We abode in the ship; we tried to hold her in her course." But why did they abide in the ship? What ship was it? What was her course? Where is she now, and who is navigating her?

A correspondent, apropos of the warrant issued for Sheridan's arrest, asks: "Has the Secretary of State a right to issue a warrant of arrest under *any* circumstances? If so, can such warrant be placed in the hands of a foreign Minister for service? In times of peace, can warrants of arrest be issued by any but magistrates and judges, on affidavits?" The Revised Statutes provide that persons charged with crimes under an extradition treaty may be arrested "upon complaint made under oath," and brought before a Judge or Commissioner, who certifies all the proceedings to the Secretary of State; and the Secretary, if a treaty crime is made out, issues his warrant for the surrender (U. S. R. S., Sec. 5,270). Warrants are served, as a general thing, by marshals. Our laws do not permit the British Minister to serve warrants, either in time of peace or war, nor would his official and social duties leave him time for such work. Our correspondent wishes that Mr. Frelinghuysen would recollect that "Eternal vigilance is the price of liberty." We sincerely hope it is not necessary to remind him of this. An American statesman who forgets what the price of liberty is, or shows signs of believing that it is "marked down," to suit the times, to occasional vigilance or casual vigilance, is not the man to be intrusted with such a place as that of Secretary of State. Only the one-price system is compatible with the perpetuity of free institutions.

Mr. West, the British Minister, was asked on Sunday about the Sheridan extradition, and frankly stated that he knew nothing whatever about the strength or weakness of the Government's case; the depositions of the witnesses, or, in other words, the evidence, not having reached him. It appears from his statement, however, that he believes that if he can get a favorable decision from the Commissioner here, and no objection is raised by the State Department, he will secure Sheridan's surrender without further trouble. But there can be little doubt that Sheridan will, if things look badly for him, do his utmost to bring the matter before the courts. Under the recent decisions of our courts, to which we have more than once referred, extradition is not simply a matter between the two Governments, but, at least in this country, the prisoner may himself call for the aid of the courts if the treaty is violated. In the cases which have arisen, the prisoners, having been surrendered by England to this country for trial, secured their release by showing that they were being prosecuted for an offence other than that for which they had been surrendered—an offence outside the treaty. For instance, a fugitive from this country to England, surrendered for murder and proceeded against here for treason (a political offence outside the treaty), could get himself set free at once, provided these decisions were followed. Now, suppose the case reversed, and that Sheridan, having asylum here, and being in danger of being surrendered by the United States to England for "murder," under the treaty, wishes to show that the murder was really a political crime, and therefore not covered by the treaty, can the judges refuse to hear him? Must they vindicate the right of asylum in one case and wash their hands of it in the other?

According to a cable despatch, the London *Law Times* makes the suggestion with regard to the Sheridan extradition case that the Ashburton Treaty contains no proviso preventing the surrender of political refugees. Its idea seems to be that Sheridan's case is outside the treaty, and that the State Department can surrender him if it chooses. This is law with a vengeance. When the treaty of 1842 was sent to the Senate President Tyler said: "In this careful and specific enumeration of crimes, the object has been to exclude all political offences, or criminal charges arising from wars or intestine commotions." Even Mr. Fish, in the Winslow correspondence, in which he endeavored to show that a man who was extradited for a treaty crime could not object if he were tried for an offence outside the treaty, expressly disclaimed all idea that political refugees were to be regarded as criminals by either country. He referred to it as a thing "inherently impossible," and as "beyond the possibility of contemplation." Since that time, too, two very important decisions have been rendered, one by the Kentucky Court of Appeals (Com. v. Hawes, 13 Kentucky Rep.), and the other by the United States District Court in California (U. S. v. Watts, 14 Federal Reporter, No. 3), in which the treaty has been thoroughly examined, and it has been expressly held that it excludes political and all other offences not expressly included in it. Sheridan must be extradited, if at all, for the crime of common murder, "upon such evidence of criminality," to follow the language of the treaty, "as, according to the laws of the place" where he is found, "would justify his apprehension and commitment for trial if the crime or offence had there been committed."

It appears as if Englishmen were beginning to see the bearing on the extradition of Sheridan, and, it may be, of other Irish conspirators, of the attempt, in which Mr. Forster has been the most prominent actor, to make the Dublin assassinations the work, not of a small band of conspirators, but of the Land League, headed by Mr. Parnell and his Parliamentary followers. This attempt was really begun immediately after the murders in Phœnix Park. It was, perhaps, not unnatural, in the excitement and anger of the moment, that many Englishmen should be disposed to lay on the promoters of the Irish agitation the blame of all the crimes which anybody who shared in it had committed. But it was very bad politics to allow this feeling to find formal or frequent expression. Mr. Gladstone, it is but just to say, avoided it. He refused to regard the Phœnix Park assassinations as the crime either of the Irish people or any considerable part of it, as the Tories and a very large body of his own followers would undoubtedly have wished him to do. He refused to lay aside on account of it his scheme of relief and conciliation, and passed the Arrears Bill just as if nothing had occurred to throw doubt on the utility of conciliation. This was the part of wisdom, even if he supposed that every man in Ireland was an assassin. Burke said that you cannot draw an indictment against a whole people. He might have added that even if you could, it would not be sound policy to do it. Large masses of men cannot be punished. They have to be won over. No matter how low your opinion of them may be, if you have to govern them you must conceal it, and act as if you thought well of them. If invective and sweeping generalization, directed against whole races and creeds, were of any use as reformatory agencies, the Irish ought now to be the happiest and most virtuous people on the globe.

It would have been well if Mr. Gladstone could have imposed his own statesmanlike reserve on all his followers. He was not able to do so. Mr. Forster committed the great folly the other day of charging complicity in or connivance at the assassinations not only on Parnell and his Parliamentary followers, but on the Land League, an association which we have no doubt included the vast majority of the Irish farmers and small shop-keepers. This was unfortunate, even with reference to domestic politics alone, because it could not do any good. It exasperated the Land Leaguers, and made, we venture to say, not one human being think ill of them who had previously thought well. Since then Lord Hartington has had the extreme imprudence—to use a mild term—to declare that although Ireland ought to have representative county government, it would be dangerous to give it now; which is a roundabout way of saying that the bulk of the people are animated by designs dangerous to the public peace and security. This was mere exasperation, and for no apparent practical result. But now comes from this unfortunate freedom of speech an immediate inconvenience. If it were generally agreed that the "Invincibles" were a small body of conspirators, without popular support or connivance, like most other murderers, there would probably be little difficulty in obtaining Sheridan's extradition. His chance of safety lies in making it clear that the Invincibles—if he was one of them—were a political body, fairly representing the feelings and aims of a large body of his countrymen; or, in other words, that their doings have one of the characteristics of a po-

pular revolt. Mr. Forster, and several other English politicians, as well as the London *Times* and others of the London press, have, by magnifying the Invincibles into a very widespread organization, been actually helping him to make his crime—if he be guilty—appear a political one, and to furnish our Government with solid reasons for refusing to deliver him. In fact, nearly everything that has been said in England, in the anti-Irish sense, including Mr. Forster's speech, since Carey's confession, has helped to make any Irish fugitive criminals there may be in this country feel safer. It puts them in the category of the Nihilists, and the Carbonari, and the French Reds, and divers other tyrant-killers whom England in times past has been proud to shelter, and makes easy work for our State Department in declining their extradition.

The reply of the select committee appointed by the Trustees of Columbia College to the petitioners who asked for higher educational advantages for women in connection with the college, is not as gracious as it might be. There is something like a lofty assumption of superior intelligence, not to say something like a desire to administer a snub, in the language in which the Committee speaks of the petitioners, who in fact represent the very best class of our citizens. The Committee also inveighs with great vigor against the idea of a co-education of the two sexes as a revolutionary thing, while the petitioners had repeatedly protested that co-education in the ordinary sense was not at all the thing they were asking for. The emphasis with which the Committee dwells upon this point, reminds us of the time when the anti-slavery men were insisting upon the exclusion of slavery from the Territories, and when the slaveholders met them with this knock-down argument: "Do you want your daughter to marry a nigger?" Finally, the Committee recommend that a plan be drawn up for a course of studies outside of the college, but aided by it; for reviews and examinations by the faculty of the college at which any young woman who has "diligently pursued the course prescribed," may present herself, and for the award to each young woman sustaining such examination a suitable diploma or testimonial attesting her success. This is something at least; perhaps more than the opening of the report encouraged us to expect. As chairman of the Committee, Dr. Dix's name heads the signatures to this report.

The return of Mr. Gladstone to England is said to have been unduly hastened—unduly as far as his health is concerned—by the growing dissensions in the Cabinet between the Radicals and Whigs, or rather between Mr. Chamberlain and the Whigs, for Mr. Chamberlain now seems to be the only representative the Radicals have in the Cabinet. Sir Charles Dilke has very distinctly announced his withdrawal into the ranks, if not of the Whigs, of the Moderates or "Opportunists," as they are called in France; and between Lord Hartington and Mr. Chamberlain there is a breach which nothing less potent than Mr. Gladstone's influence can bridge over. The latest collision in their speeches out of doors is over Irish county government. Mr. Chamberlain says it ought to be reformed at once. Lord Hartington says it would be dangerous to reform it until the Irish begin to behave better, and that it is, therefore, not to be thought of at present. He is afraid that a representative county government, elected by the rate-payers or by manhood suffrage, would be used as a means of attacking property and preaching sedition. If this view should prevail generally in England, it would open up a very dismal future for what is called the Irish question. The Irish say that they do not behave well because they have grievances, and will not behave well until these are redressed. To which the Hartington branch of the Whigs make answer that they must behave well before the grievances can be redressed. As the Irish can evidently display fully as much persistence in behaving badly as the English in refusing to redress grievances, this Whig view appears to keep the Irish question in the vicious circle in which it has been revolving for two hundred years; and the Radicals are able to oppose to it the fact that if it had uninterruptedly prevailed in all cases, the English would never have got their Reform Bill and the Irish their Catholic Emancipation.

Mr. Chamberlain, who is very obnoxious to the Whigs, as well as to the Tories, on the ground that he is the originator and promoter of that detestable thing the caucus, is weighted heavily as a Cabinet officer by the fact that he is the only one who has no social backing in London. The others are all members of what is called London Society, and have at least a fair share of such countenance (which is, to be sure, not much) as London Society gives to Mr. Gladstone and his followers. Mr. Chamberlain is, however, distinctively a manufacturer from the provinces, and especially from that most odious bit of the provinces, Birmingham, and has little or no "show," as the pugilists call it, in the Metropolitan world. He is, in the eyes of the clubs and dinner parties, an even more odious enemy to the established social order than Gladstone himself. His admission to the Ministry was largely due to Gladstone's recognition of the strength in Scotland and the great towns of the way of looking at politics which Mr. Chamberlain represents. None of the other members of the Cabinet perceive it so clearly, and they are really only sustained in their toleration of these opinions, or in their support of them, in the teeth of the hostility of the wealthier classes in London, by the dominating influence of Mr. Gladstone. It must not be forgotten, too, in witnessing or wondering over the dissensions in Mr. Gladstone's Cabinet which have led to the withdrawal of the Duke of Argyll, Mr. Forster, and Mr. Bright in succession, that hardly one of the questions now before the country came up in the canvass of 1880. That canvass consisted in the main of a very brilliant assault on the policy of the Tories, which was entirely a foreign policy. They had no domestic measures to be condemned or resisted. The principal reason given for turning them out of office was that they were involving the country in disastrous wars all over the globe. About home matters the Liberals had nothing to say except that Mr. Gladstone might be trusted to do what was right. Consequently, Ireland, as well as Egypt, is a new question, upon which the Ministers had never compared views till it came upon them after taking office, and it has been made more grave by the fact that it has lost the religious character which it possessed for over a century and taken on a social and agrarian character, which is full of suggestion touching their own condition for Englishmen. The attitude of the Cabinet toward it, in fact, is very much like that of the Republican party toward the tariff—that is, a slightly bewildered and puzzled one, which makes a man with clear and decided views on it, like Chamberlain, seem a little odious.

The conference recently assembled at London for the purpose of settling anew the status and conditions of the European Commission of the Danube has renewed that international institution, as the cable reports, for twenty-one years from next month, when its present term of twelve years expires. The Commission was created by the Treaty of Paris in 1856, its existence prolonged for twelve years by an agreement in March, 1871, and its authority enlarged by the Congress of Berlin in 1878. It consists of representatives of the seven signatory powers of the Treaty of Berlin, and of Rumania. Its seat is Galatz, and it possesses certain sovereign rights over the portions of the Danube below that Rumanian city, which entitle it to regulate the navigation, guard its freedom and security, improve its facilities by the construction of new works, levy imposts, and contract loans. Before the convocation of the London Conference the claims of Austria-Hungary to have a disproportionate share in the management of the Commission, and the demand of Rumania—which had risen to the dignity of a kingdom—to be admitted to the Conference on a footing of equality with the Powers, had led to very acrimonious discussions in the press, to a lively exchange of diplomatic notes, and to vehement manifestations of national pride and resolution in the Parliament of Bucharest. The Vienna Cabinet was, however, strengthened by its alliance with Germany, by the disinclination of France to place herself in a state of antagonism to the interests of that alliance, and by the readiness of Russia, in her present position of uncomfortable isolation, to sacrifice the interests of Rumania for the sake of a much-needed reconciliation with the two neighboring Empires. M. Giers's visit to Vienna smoothed the way for an arrangement altogether favorable, as it appears, to the demands of Austria-Hungary. In regard to her leadership in the Commission a friendly compromise proposal of French origin was adopted, and Rumania was granted no more than Servia, another new riparian kingdom—that is, merely a consultative voice in the Conference. Rumania spurned this offer, and instructed her representative in London to abstain from participation in the deliberations and to enter a most emphatic protest, declaring that resolutions adopted without her consent, and with such flagrant disregard of vital national interests and rights, would not be binding on her. This protest remained unheeded.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, February 28, to TUESDAY, March 6, 1883, inclusive.]

DOMESTIC.

ON Wednesday the Senate passed the bill to increase the pensions of one-armed and one-legged soldiers, and showed a disposition to reconsider the motion by which they had agreed to a conference with the House on a tariff bill, but no action was taken. Messrs. Bayard and Beck withdrew from the conference which met that evening, and on Thursday much time was spent in the appointment of their successors. Messrs. Mahone and McDill finally accepted the positions. Several amendments to the Sundry Civil-Service Bill, including one appropriating $40,000 for the protection and improvement of the Yellowstone National Park, and providing for a Superintendent and ten assistants to live in the Park and take care of it, were adopted, and the bill was passed. On Friday the conference reports on the Legislative, Executive, and Judicial Appropriation Bills, and on the Tariff Bill, were received and adopted—the latter by a vote of 32 to 31. On Saturday a motion to lay on the table the House River and Harbor Appropriation Bill was carried. Mr. Davis resigned the Presidency of the Senate, and a resolution declaring Mr. Edmunds President was adopted. The Senate remained in session until 5 o'clock Sunday morning, when a recess was taken till 9 o'clock. The Tariff Bill was received from the House, was signed by the President of the Senate, and sent to President Arthur, who at once signed it. Several of the general appropriation bills were received from the House and passed. At 12 o'clock on Sunday Mr. Edmunds declared the Forty-seventh Congress adjourned *sine die*.

In the House on Wednesday Mr. Randall declined to serve as member of the Tariff Conference Committee, and Mr. Speer was appointed in his place. The River and Harbor Bill was discussed in the evening. On Thursday the River and Harbor Bill was passed by a vote of 112 to 90 after a stormy scene. On Friday the Senate Pension Bill, the Naval Bill, and the Legislative and Army Appropriation Bills were passed; and on Saturday, the Conference Tariff Bill, by a vote of 152 to 116. In the night the last of the contested-election cases were disposed of by the seating of Mr. Cook (Greenbacker), of Iowa, and adopting the minority report of the Committee, declaring Mr. Lee (colored, Republican), of South Carolina, elected; but the Democrats filibustered, and refused to reject the majority report, so that Mr. Lee was not seated. The Sundry Civil Appropriation Bill was passed, thus disposing of all the appropriation bills. A strenuous attempt was made to take up the Bonded Whiskey Bill, but in vain. The House met at 9 o'clock Sunday morning, and the customary resolution tendering a vote of thanks to the Speaker was offered. It was of course passed, but eight members deliberately voted against it. The death of Alexander H. Stephens was announced, and resolutions of respect adopted. The Speaker then made his closing address, containing the usual congratulations, and the session ended.

One of Speaker Keifer's last official acts was to dismiss, without cause, Mr. Tyson, one of the stenographers of the House appointed last winter, and appoint his (Mr. Keifer's) nephew in his place. The conclusion drawn is that the Speaker dismissed Mr. Tyson in order that his nephew might draw the salary during the vacation, when there will be no work. This act has excited much adverse comment.

The President on Thursday nominated S. W. Burt, the Naval Officer in the New York Custom-house, for Chief Examiner under the Civil-Service Commission, and Elihu Root for District Attorney of the Southern District of New York, to succeed Mr. Woodford. Mr. Burt declined the nomination, on the ground that he could not afford to take the place on account of the smallness of the salary, and on Friday, Edward O. Graves, Superintendent of the National Bank Redemption Agency of the Treasury Department, was nominated in his stead. Mr. Graves also declined the nomination. Charles K. Graham was nominated for Mr. Burt's place as Naval Officer. These nominations, which were confirmed by the Senate, have been generally approved by the press, with the exception of that of Mr. Burt, which is regarded as a plan to get him out of the Custom-house, since it was tolerably well known that he would decline the position of Chief Examiner under the Civil-Service Commission.

Some important decisions in cases involving the efforts of creditors to hold States to their contracts in the issue of bonds, were handed down by the Federal Supreme Court on Monday. In 1874 the Legislature of the State of Louisiana passed an act consolidating the bonds of the State in a new loan, and a special tax levy was provided to meet the requirements of the loan. In 1879 a new State Constitution was adopted, containing a debt ordinance making a new adjustment of the debt of the State, and changing the tax levy so as to make it impossible for the Board of Liquidation of the State to meet the requirements of the act of 1874 in case it should be held binding. Certain bondholders, citizens of the State, brought suit and asked for a mandamus compelling the officers of the Board of Liquidation to carry out the provisions of the law of 1874. The Supreme Court holds that the Executive officers of the State constituting the Board of Liquidation are subject to the Constitution and laws of the State, and that the judiciary of the United States cannot intervene between the State and its officers and take control of the action of the latter. Another decision holds that a citizen of one State cannot collect his claims against the government of another State by the assignment of his claims to the government of his own State and the bringing of a suit by the latter. The main ground of the decision is that such a proceeding is in the nature of an attempt to evade the restrictions of the Eleventh Amendment to the Constitution, and that citizens of a State can maintain no action through and in the name of a State, which they could not maintain of their own right and in their own name.

The decrease of the national debt in the month of February amounted to a little more than $7,500,000, or only a little more than half the average monthly reduction for the seven months ending January 31. The total reduction since June 30, 1882, or for two-thirds of the current fiscal year, is a little more than $102,500,000. The Secretary estimated the surplus for the year at $120,000,000, to which $15,000,000 may be added because of an excessive appropriation for pensions. These figures indicate an average monthly reduction of about $8,000,000 for the remaining four months of the fiscal year.

Mr. James Gilfillan, Treasurer of the United States, has handed in his resignation, to take effect on the 1st of April.

The Chief of the Bureau of Statistics reports that the excess of the value of exports of merchandise for the month of January, 1883, was $23,397,430; for the seven months ended January 31, 1883, $77,972,899. The imports of merchandise for the twelve months ended January 31, 1883, were $752,727,367, and for the twelve months ended January 31, 1882, $681,880,814, showing an increase of $70,846,553. The exports for the same period were $783,298,409 and $824,391,216, respectively, showing a decrease of $41,092,807.

Alexander H. Stephens, Governor of Georgia and ex-Vice-President of the Confederate States, died in Atlanta, Ga., on Sunday morning. He was born in Taliaferro County, Ga., in 1812. He served in the House of Representatives from 1843 to the close of the Thirty-fifth Congress. When Georgia seceded from the Union, he went with his State. He was elected Vice-President of the Confederacy to conciliate the moderate Secessionists in the South, and was never fully in accord with Jefferson Davis. After the close of the war he accepted the situation, and made many conciliatory speeches. He was elected a member of the Forty-third Congress and served till the end of the session of 1882. He was elected Governor of Georgia by a large majority last fall.

James S. Boynton, President of the State Senate, was sworn in as Governor of Georgia on Monday. He has ordered an election to fill the vacancy caused by the death of Mr. Stephens, to take place on April 24.

On Thursday the long contest, said to be unprecedented in the history of the State, for the election of a United States Senator from Michigan, was terminated by the election of Thomas W. Palmer, of Detroit, to succeed Senator Ferry.

The Republican State Convention of Michigan convened in East Saginaw on Wednesday. Austin Blair was nominated for Justice of the Supreme Court, for the long term, and Thos. J. O'Brien for the short term. Henry B. Hutchins was nominated for Regent of the University, for the full term, and Joseph C. Jones, of Saginaw, for the short term. The Convention broke up amid confusion.

The Republican State Committee of Connecticut on Monday night elected Senator Orville H. Platt a member of the Republican National Committee in place of Marshall Jewell.

The Fusion-Greenback State Central Committee of Maine held a meeting Wednesday night, in which every county was represented. It was decided to act with the Democratic party in 1884, and to ignore totally the Solon Chase Greenbackers.

The Grand Jury at Milwaukee, in their final report on the Newhall House disaster, held the owners blameless and mildly censured the landlord. They said, in regard to the hotel building: "We find that the Newhall House was constructed in as substantial a manner as such buildings usually are; that there was scarcely a hotel in the country as easy of egress as the Newhall House; and that the owners had done all that was reasonable for protection and escape in case of accident."

The latest news from the lower Mississippi River is that the water at Helena is rising at the rate of about half an inch per hour, and it is now thought that the highest mark of last year will be reached. Accounts from the section between Friar's Point and Vicksburg on the Mississippi side of the river are that the levees there are still unbroken and no danger is apprehended, the planters being busy ploughing and putting in their crops. A Helena despatch says: "The Fitzhugh Levee, five miles south of this city, gave way last night. This morning the crevasse was over one hundred yards wide, and was becoming rapidly wider. The rush of water through the opening was terrific. The whole country around Old Town is believed to be inundated."

FOREIGN.

The British Government has made demands upon the Governments of the United States and France, for the extradition of Sheridan and Byrne respectively, for complicity in the Phœnix Park murders. The warrant of arrest for Sheridan was granted by Secretary Frelinghuysen, but no further steps have been taken by the English Government. It is believed that they are waiting to obtain such evidence as to establish a clear legal presumption against him. Meanwhile the question of whether Sheridan is subject to extradition is exciting discussion both here and in England.

Byrne, on the other hand, has been arrested in Paris on the direct charge of assassination, and on Wednesday he appeared before the Public Prosecutor. He denied that he was

guilty of assassination, and refused to reply to further questioning. He is kept a close prisoner. The Council of Ministers will finally decide whether he shall be surrendered or not, and are awaiting the arrival of documents from England before passing upon the question. The friends of Byrne have sent for evidence to prove an alibi for him on the 6th of May last, the day upon which the Phœnix Park murders were committed. On Monday it was stated that two Irish members of Parliament had made affidavits that they saw Byrne in London on the above-mentioned date. If an alibi is proved, it is expected that the French Government will at once set him at liberty. His arrest has caused violent attacks upon the Government in the French Radical newspapers.

Fifty suspicious persons are said to have left Ireland since the inquiry at the Castle was begun. A Dublin despatch to the *Daily News* on Saturday said: "The police have made startling discoveries at Rochdale. Lists of the names of the chief members of various secret societies, and documents disclosing their extent, have been seized at the lodgings, in Rochdale, of Walsh, who has been arrested at Havre, and who has been organizing a secret society in the North of England. Correspondence with Byrne regarding the organization, and a photograph of 'Number One,' clearly establishing his identity, were also found." The extradition of Walsh has been demanded from France. The letters seized at his house are said to reveal the fact that 6,000 men, amply provided with funds and revolvers, were enrolled in a secret society, which he was organizing in the North of England. Arrests continue to be made in Ireland.

A despatch from Loughrea, Ireland, says that the distress among the people there is alarming. Crowds besiege the houses of the priests, clamoring for food. Mr. Childers, Chancellor of the Exchequer, discussing the distress in Ireland in the House of Commons, on Wednesday, said that the Government would not shrink from taking strong measures if they were likely to have permanent effect. He pointed out that wages were high, and that the distress only affected overcrowded districts. He hoped that the Irish members would do what they could to restore confidence in Ireland, so that promoters of public works would be able to obtain loans from private sources instead of from the Government.

In the House of Commons on Thursday Mr. Parnell complained of the seeming intention of the Government to relieve the distress in Ireland by poorhouses and emigration. The Right Hon. Lyon Playfair announced that his resignation as Deputy Speaker was caused by ill health, and the Marquis of Hartington gave notice that he would on Friday move the appointment of Sir Arthur J. Otway to the office, and on Friday the latter was unanimously elected. A motion offered by Mr. Richard O'Shaughnessy, member for the city of Limerick, declaring it expedient to introduce in Ireland the principle of compulsory education, was agreed to. On Monday Mr. Gladstone entered the House for the first time since his return from Cannes. He was received with loud cheers from all sides. The Under Foreign Secretary, in reply to a question, said the surrender of P. J. Sheridan had been asked of the United States Government, but that he was unable to say anything further in regard to the matter. Mr. Parnell having asked a question touching "the starving condition of the people of Ireland," Mr. Trevelyan in reply denied the existence of such distress as was alluded to by Mr. Parnell. Mr. Gladstone stated that the Government intended to withdraw the troops from Egypt as soon as the aims of the occupation had been obtained. These were the establishment of order and liberty and the security of the passage of the Suez Canal. On Monday night he said the recent surmise of Lord Hartington, that the evacuation of Egypt might be completed in six months, was merely an expression of hope founded on circumstances as far as they had gone.

The House of Lords on Tuesday again appointed a committee of inquiry into the effect of the Irish Land Act. Lord Carlingford, Lord Privy Seal, adhered to his former opinion that such an inquiry would do no good, but he did not oppose it.

A despatch from Dublin says: It is expected that Messrs. Brennan and Egan and several of Mr. Parnell's followers in the House of Commons will accompany the latter to America. Their intention is to give a full account to the Irish in America of the way in which the funds of the Land League were disposed of.

It is stated that Mr. Gladstone, in an interview on Tuesday, February 27, with President Grévy and M. Challemel-Lacour, Minister of Foreign Affairs, appeared to be desirous to end the present tension between France and England. It is believed that fresh negotiations relative to Egypt are impending, not, as hitherto, on the basis of a *condominium*, but on an arrangement that will place France in a more favorable position than she now occupies.

A despatch from Cairo says that Abd-el-Kader Pasha has arrived at Senaar, after severely defeating the False Prophet, who lost 2,000 men.

A general meeting of the National Rifle Association was held in London on Wednesday. The Duke of Cambridge, who presided, referred to the American team in the last international match. He said that nothing could exceed the kindness and hospitality which the Americans showed to the British team during the visit of the latter to the United States. The Council of the Association, he said, looked forward with pleasure to giving an American team a most hearty welcome at Wimbledon.

In the French Chamber of Deputies on Monday, on the question of taking into consideration the proposals for a revision of the Constitution, M. Ferry, the Prime Minister, formally refused to court a repulse by presenting any such proposal to the Senate. The Government, he said, would energetically bring the matter before the Chambers, when it believed that a revision was possible; the present moment was inopportune. The people would withdraw their support from the Republic if they saw it meant instability and agitation. The question was one for friendly compromise, and should not be raised as a means of revenge against the Senate. An attempt might be made before the elections in 1885 to induce the Senate to accept a revision.

The question of the revision of the Constitution came up again in the French Chamber of Deputies on Tuesday. The President of the Chamber read a motion declaring that the Chamber, having confidence in the Government, rejected the proposal to consider the matter of a revision. M. Ferry accepted the motion, and it was adopted by a vote of 307 to 182.

In the French Senate on Thursday General Thibaudin, Minister of War, replying to an interpellation, said that the presence of Princes in the Army was unconstitutional. The Duc d'Audiffret-Pasquier, Orléanist, reproached General Thibaudin with having committed an act which nobody else could be found to perform. On Saturday the Senate adopted a bill organizing French jurisdiction in Tunis.

A Legitimist meeting was held at Lille, France, on Sunday, at which five thousand persons were present. MM. Baudry-d'Asson, Deputy, and Barbès delivered addresses in which they violently attacked the Republic. A resolution was unanimously adopted pledging all persons present to support the royalist cause in the coming struggle.

A band of masked and armed men, supposed to be members of a secret society, entered a farm at Puerto Serrano, Andalusia, Spain, and murdered the men, assaulted the women, and destroyed everything on the place. Several plantations in Andalusia have been partially destroyed by similar bands. Some emissaries of a secret society who have been arrested were found furnished with fresh orders from their chief, a schoolmaster, who has also been arrested.

In the Chamber of Deputies on Wednesday, Señor Candam declared that a society called the "Black Hand," similar to the Internationale, existed in Spain, which aimed at collective instead of individual rights of property. The Minister of the Interior replied that he had known for a year of the existence of such a society, and had placed the affair in the hands of the authorities. He said the Prefects in Andalusia had been directed to protect the farmers.

The Chamber of Deputies on Thursday rejected, by a vote of 126 to 45, the motion introduced by the Republicans, asking for a Parliamentary inquiry with regard to the arrests that have been made in Andalusia. The Minister of the Interior said that the troubles were of ancient date; a Parliamentary inquiry was unnecessary.

It is stated that the Anarchists intend to stir up laborers to a general strike for the purpose of preventing the crops from being gathered. On Saturday the President, Secretary, and twelve members of a branch of the society were arrested in Seville, and letters and statutes of the society were seized. On Sunday more important arrests were made. The judges who are conducting the investigation in regard to the secret societies are in constant receipt of threatening letters.

General von Kameke has resigned the office of Minister of War of Germany because of difference of opinion in regard to important military principles which were discussed at a recent conference under the presidency of the Emperor. His resignation has been accepted by the Emperor, and General Blumenthal, commander of the Fourth Army Corps, appointed to succeed him.

The German Government has decided to reintroduce into the Reichstag the budget for 1884–'85.

The silver-wedding festivities of the Crown Prince and Princess of Germany, which were postponed at the time of the anniversary of the wedding on account of the death of Prince Charles, took place in Berlin on Wednesday. The streets were thronged with people. Busts of the Crown Prince and Crown Princess were exhibited at various points in the city. The city was illuminated at night.

The revenue of Russia from imports during the year 1882 exceeded that of 1881 by 13,000,000 rubles, but was less than that of 1880 by 5,500,000 rubles.

It is announced from Norway that the committee which is considering the conflict between the Crown and the Storthing has resolved, by a vote of six to three, to propose the impeachment of the Ministry.

The memorial tablet in front of the house, in Rome, formerly occupied by Prof. Samuel F. B. Morse was unveiled at 2 o'clock on Monday. Mr. Astor and the whole American Legation, Signor D'Amico, Director-General of Telegraphs, many prominent members of the American colony, and other well-known persons were present. After speeches appropriate to the occasion had been made, Mr. Astor thanked the municipality in behalf of the United States, the American colony in Rome, and all Americans, for their action in causing the erection of the tablet. Signor D'Amico, in reply, paid a high eulogy to Professor Morse. In conclusion, he said: "Rome, the mother of civilized nations, honors in Professor Morse a young nation which is splendidly paying her debt to antiquity."

Calcutta advices state that the most intense excitement is felt among Europeans because of the proposed law giving native magistrates criminal jurisdiction over whites in certain cases.

THE ADJOURNMENT OF CONGRESS.

THE Forty-seventh Congress, which expired on Sunday, will not be "pointed at with pride" by either party, for it has given less evidence of ability among its members in either branch, and it has excited more adverse criticism, than most of its predecessors. Its debates have been exhibitions of the dreariest kind of mediocrity, and its acts were the result of a helpless obedience to pushing or restraining outside forces of various kinds. It has brought forth some good legislation, but some of the best of it the majority was driven into against its own liking. On the whole, it may be said that the Congress just expired furnished a fair example of what poor material the spoils system in politics, and the kind of party management born of it, will bring to the front in ordinary times. It will be admitted that Mr. Keifer was a sorry apparition in the Speaker's chair; but it cannot be denied that in point of ability, as well as moral tone, he fairly represented the House over which he presided. Neither political party in it was under strong intellectual leadership, and neither showed any signs of being conscious of great common purposes. Evidently in this Congress the American people were, intellectually and morally, very much under-represented, if we may use such an expression.

There has been some sensible legislation with regard to the public lands and the Indian policy. Postage on ordinary letters was reduced from three to two cents. A civil-service reform bill was passed, and also a bill reducing internal-revenue taxation, and making certain changes in the tariff. On the whole, it must be said that in many respects the second session of this Congress was a decided improvement upon the first. At the first session it threatened to become the most reckless in expenditures and the most defiant in its adherence to vicious political methods that we have seen for many years. A change of tone if not of heart was brought about by the elections of last November. The same Congress which passed the most lavish River and Harbor Bill in 1882, adjourned in 1883 without appropriating a cent for such objects. The same Congress which in 1882 would have had scarcely anything but scorn and mockery for a real reform of the civil service, rolled up in 1883 enormous majorities in each house for a reform bill which scarcely a dozen members in either house could look at without secret detestation. It was an astonishing spectacle of virtue under the schoolmaster's rod. But the lack of ability and moral force was especially conspicuous in the treatment of the Tariff Bill. Congress was notoriously under the influence of the "protected industries," with the "wool interest" insisting upon this, and the "iron interest" threatening to defeat the bill if it could not have that, and so on. Nor could there be a more pitiable exhibition of readiness to bargain away principles which formerly had been treated as important, than when the House instructed its members of the Conference Committee on the Tariff Bill to bring up in that Committee the great constitutional question whether the Senate could originate revenue legislation, and then threw the question entirely aside as soon as the rates on steel and some other articles were raised.

The Republican party, being constrained to pass some kind of bill to reduce taxation, passed the only one which, under the stress of parliamentary law, could be put in shape for enactment before the 4th of March. Nothing but hard necessity could have forced the House to swallow its pride and pass a tariff bill which it had never considered in detail. Not to have passed some bill would have exposed the party to the charge of glaring incompetency, and to a summary reckoning at the polls. It is no wonder if a bill thus passed, and not so much to relieve the taxpayer as to "choke a surplus," should be at variance with sound principles of taxation. There was no decent excuse for meddling with the tobacco tax. The gross revenue from this source ought not to have been lessened. Being strictly an article of luxury, the tax upon it is a voluntary contribution to the treasury. It answers all the requirements of an unobjectionable source of public income. Next to alcoholic liquors, tobacco is the most fitting of all articles of general use to be retained as a subject of taxation. The consumers had not asked for a reduction. To throw away ten or twelve millions of revenue under such circumstances was a fiscal blunder of the first magnitude. As the Republican party can no longer subsist upon Kuklux outrages and Southern wickedness, but must maintain itself hereafter upon the less stimulating diet of taxes, tariffs, currency, public debt, and public economy, it is amazing that it should have commenced paring the revenue in the interest of chewers and smokers, who had not even petitioned for such a favor.

Mr. Kelley, of Pennsylvania, estimates the reduction of the internal revenue provided for in the bill at $35,000,000 to $40,000,000, and the total reduction at $65,000,000 to $70,000,000. This allows $30,000,000 of reduction in the tariff—an estimate altogether without foundation, as we think. Aside from the reduction on sugar, which is supposed to be about $11,000,000, there is no reason to suppose that the customs revenue will be lessened at all. The reductions of duties are trivial in any case, and are balanced by higher rates on several important articles, such as iron ore and common earthenware. Moreover, as Mr. Morrill intimated while explaining the bill in the Senate, there is the chance that the lower duties adopted in some cases may lead to larger importations, and therefore to an increased revenue. Very much depends upon the prosperity of the country and the ability of the people to buy; but supposing these factors to remain about as heretofore, there is no reason to suppose that the aggregate revenue from customs will be diminished one cent by the tariff changes, except by the slight reduction on sugar. Nor will the reduction of the internal revenue be perceived in the returns of the present fiscal year, since the new rates do not go into effect until May 1. In the next fiscal year we may look for a shrinkage of $40,000,000, and this is perhaps all that it is prudent to throw off until we know more definitely how much is wanted by the Pension Bureau.

The effect of the tariff changes upon the industries of the country, as a whole, will be trifling, because the changes are trifling. The kaleidoscope has been turned a hair's breadth and the colors transposed a little, but the component parts are the same. As Mr. Abram S. Hewitt says, the bill "will fail of its intended effect for the reason that the industries of the country are suffering, not from foreign competition, but from the domestic competition arising out of the protection we have had for the last twenty years." How absurd to imagine that trade is to be benefited by taking a shaving off the duty on iron wire, and adding it to the duty on glue! The whole bill is made up of such piddling trivialities, excepting solely the reduction of the sugar tax. The changes are generally made upon the old-fashioned principle of robbing Peter to pay Paul—a process not likely to increase the aggregate wealth of the community.

It cannot be supposed that this bill is a finality upon the questions involved in it. Fortunately there is nothing now pressing upon the public mind with greater weight than questions of fiscal policy. The debate in Congress and the struggle of special interests in the lobby have arrested public attention more fixedly than any or all things written or said upon the subject since the close of the war. The seed sown will not fail to bear its fruit.

FEMALE SUFFRAGE.

MASSACHUSETTS appears to be the only old State in which woman suffrage continues to be a serious question. In two of the undeveloped Territories of the West we believe it is in full operation, one of them being Utah. But in the East, as in England, the interest in it has either died out or ceased to manifest itself with any fulness or vigor. Even in Massachusetts, however, where the cause has a body of unusually able and persistent advocates, it seems to be losing ground, after sixteen years of very steady agitation. In the present Legislature in that State it has just been defeated by a vote, including twenty pairs, of 147 to 80. There is some dispute as to whether this shows gain or loss; but all the gain that is claimed by one of the most ardent champions is eleven votes, which is hardly worth mention, in view of the fact that the suffragists, as well as a great many of their opponents, thought that this time, with the aid of a little encouragement from the new Governor, they would carry their point. This result was helped by a remonstrance against the measure signed by a large number of women belonging to the best circles. They maintained that those women whose influence in politics would make female suffrage in any way advantageous to the State, were already so sore beset in trying to deal with the purely social problems which American life presents, that any addition to their burdens would be cruel and useless. Children, servants, charities, housekeeping, are as much as most of them, and more than many of them, can cope with already. To impose on them the duty of mastering the merits of candidates, and counteracting the schemes of wirepullers, under our system of frequent elections and complicated nominating ma-

chinery, would be, they hold, either to compel them to neglect things much more essential to the public welfare, or to intensify that sense of unfitness for their work which is already the curse of so many women's lives. This view of the subject, too, has been strengthened by the failure of the law giving female taxpayers the right to vote at the election of school boards. It was supposed that, owing to the well-known interest of women in education, they would eagerly avail themselves of this opportunity of exerting their influence on public-school management. Nothing of the kind has happened. A few hundreds only ever registered, and the number is declining every year; and it is, moreover, alleged that one great reason for the refusal of the women to use their right is the fear that if they register they will have to pay taxes which they now escape.

In and about Boston the bill suffered from one other very potent consideration, and that is that its passage would "play into the hands of the Democrats," which is a figurative way of saying that it would in Boston, as in all other large cities in the East, work the final ruin of municipal government by adding to the votes of the corrupt and ignorant males those of their sisters and cousins and aunts. Boston is undergoing an unusually painful experience this year in having the city government taken possession of by Irish citizens, whose political education in this particular field has somehow been neglected. The change is, however, not considered irretrievable. It is ascribed to the supineness of the "better element," and to the very curious condition of parties which enabled Butler to reach the Governorship. Another year the natives hope to get back the control of the city and the taxes; but they see plainly enough that with female suffrage they would have to make up their minds to Boston's sharing the fate of New York, and passing permanently under the rule of a boss to whom the servant girls and factory girls would furnish a powerful contingent, whose devotion neither the stump nor the newspaper could shake. This is true, in spite of the fact that the Catholic Church is opposed to female suffrage, and holds strictly to the Paulist view of woman's place and functions in the Church and in society. But the Catholic Church is wise in its generation. It accepts the inevitable always, and, if possible, turns it to account. It opposes female suffrage, as it has always opposed manhood suffrage and popular government generally; but if female suffrage were established, it would undoubtedly try to extract from the evil some good for the Church and the faith. It would see that the servant girls voted right about public schools and charities, and any other little matters in which its clergy took a strong interest; and certainly no reasonable man could find fault with it for so doing. The most serious obstacle which the suffragists have to face everywhere is, however, the indifference or hostility of the great body of the women, including, too, the most earnest, thoughtful, and conscientious. This can be disposed of in debate only in one of two ways: it must either be admitted that they are too ignorant, benighted, and unreflecting to see the advantage which their voting would be both to themselves and to the community—which would ruin the argument that their appearance in the political arena would improve the politics; or it must be admitted that wise, virtuous, and reflecting as they are, they are satisfied that giving them the franchise would be injurious both to themselves and the State.

The friends of the suffrage do not seem to be agreed as to the way in which the very puzzling dilemma is to be approached. The majority, including the Rev. James Freeman Clarke, resort to the very hazardous expedient of comparing the women who do not wish to vote to the negro slaves who did not wish for their freedom. This might be effective if the men on whose minds it is intended to operate, were as far removed from the women whom it is proposed to enfranchise, as those who emancipated the negro were from the objects of their humanity. Moreover, even if the suffrage were, like liberty, one of the natural rights, those who propose to bestow it on unwilling women set before themselves a very formidable task when they try to persuade men that they need not mind what their wives and sisters say about it, and that they will do well to give them the ballot in spite of their screams. That the suffragists should expect to make progress in this way, strikes us as proof of extraordinary ignorance as to the influence women now exert on men's opinions touching all matters of politics which peculiarly affect women's condition. On a question like the bestowal of the suffrage, there are probably very few men who are not tenfold more affected by what the women of their own household say than by anything which they hear from the stump or the newspapers. If his wife or sister is foolish, ignorant, or thoughtless, this fact alone constitutes for every man an argument against female suffrage which besets him at every turn of his life, and which arms him in triple brass against the ablest *à priori* efforts of its prophets and evangelists. If, on the other hand, they are women whose judgment he respects, whose character he admires, and in whose counsels he has often found salvation at great and trying crises in his life, their unwillingness to vote is to him conclusive proof that they ought not to be asked to vote. In fact, we can recall no agitation of ancient or modern times which seems to us to be surrounded by so many difficulties as that which our woman suffragists have on their hands; for they are the only champions of the oppressed who have incurred the deep hostility and suspicion of the objects of their devotion.

THE BOND CASES.

THREE very important cases were this week decided by the Supreme Court at Washington, all involving the rights of creditors of defaulting States.

In the first of these, the States of New Hampshire and New York brought suit against the State of Louisiana, to enforce payment of repudiated bonds, held by citizens of the two former States. The Eleventh Amendment to the Constitution forbids suits against one State by citizens of another, and to meet this difficulty New York and New Hampshire passed acts authorizing the transfer to them of claims against defaulting States, and suits were then brought in the names of the respective States. The Supreme Court has decided that these suits cannot be maintained, mainly because the result would be nothing more nor less than an evasion of the Eleventh Amendment, and would practically legalize suits of private claimants against States. This decision will surprise no one, for the attempt to compel States to meet their obligations in this way was generally regarded as a desperate one not only among lawyers, but by the creditors themselves. On the whole, we think the decision is fortunate, for a practical nullification of a plain provision of the Constitution by means of a device of the kind proposed, though it might have caused a temporary satisfaction among creditors, would have tended to impair confidence in the Supreme Court. A decision the other way would have amounted to the repeal of a part of the Constitution by the resort to a legal fiction—something that, in the development of constitutional law in this country, self-respecting judges have always carefully avoided. If suits against States by private creditors in the Federal courts are a desirable thing, the true way to confer the jurisdiction upon them is that by which it was originally given, and subsequently taken away—the adoption, after proper debate and discussion, of a new rule of constitutional law for the guidance of the courts.

The decision in the Elliott cases is fully as important as the foregoing, but there was room for a difference of opinion upon one of the points involved, which is reflected in the dissenting opinions of Judges Field and Harlan. Both cases grew out of proceedings of the Louisiana Legislature, which in 1874 passed an act providing for an issue of "consolidated" bonds bearing interest at seven per cent. A Board of Liquidation was created to issue these bonds and to exchange them for the old bonds of the State, and a State tax of five and one-half mills on all property was provided for to meet the interest and principal of the debt. In 1880, by means of a new Constitution, the State passed what is known as the "debt ordinance," and "scaled" the interest to two per cent., fixed the maximum rate of taxation *for all purposes* at six mills, made the consolidated bonds exchangeable for new obligations at the rate of seventy-five cents for one dollar, the new bonds to bear interest at four per cent. In the same year Elliott and other holders of the consolidated bonds brought two suits to have the debt ordinance declared void as a violation of the contract made in 1874, and to have the provisions of the act passed in that year carried out. One was a mandamus suit brought against the Auditor, Treasurer, and Board of Liquidation, to compel them to do their duty under the act of 1874; the other was an equity suit against various State officers comprising the Board and having authority over the taxes, founded upon the idea that the proceeds of the tax of 1879 in the treasury constituted a trust fund, of which the defendants individually must be regarded as trustees, applicable to the pay-

ment of the claims of the holders of consolidated bonds.

The Supreme Court decides that, while there is no doubt that a valid contract was made with the creditors in 1874, nor that it was violated in 1880, neither remedy is open to the holders of bonds; that the contract cannot be enforced by coercing the agents and officers of the State to violate the express commands of its Constitution; to raise taxes that they are not required by State law to raise; to "use the public money in the Treasury and under their control in one way, when the supreme power has directed them to use it in another." With regard to the supposed trust, the Court says that if there is any trust, it is the State that is trustee, not the individual officers, and the State cannot be proceeded against. On the whole, neither remedy could be applied for without ousting the political power of the State and substituting the Federal judiciary in its stead.

The case of Antoni against Greenhow, the Treasurer of the city of Richmond, the last on the list, seems to us to be open to much more criticism than either of the others. This grew out of the so-called Riddleberger bill, framed by the Virginia repudiators for the purpose of preventing bondholders getting their coupons received for taxes, as under the law they were allowed to do. Before the passage of the bill, in case the coupons were not received, they had a very simple remedy in the Court of Appeals by mandamus, by which the court compelled collectors to take them. The Riddleberger bill, passed ostensibly for the purpose of preventing spurious coupons being palmed off upon the State, provided that the tax due must be paid in money, and that the coupons must be filed in the Court of Appeals, and must be sent to a local court to have the fact of their genuineness and receivability determined, subject to appeal to the Circuit Court and the Court of Appeals.

Now, the Supreme Court holds that, the coupons being receivable for taxes under the law, the State is bound to provide "an adequate and efficacious remedy" to compel a tax collector to receive them; but, at the same time, it holds that the Riddleberger remedy is "substantially equivalent" to that by mandamus. How a remedy which first compels the taxpayer to provide not only the coupon, which the law says shall be taken *instead* of the tax, but the money itself, and then enables the State to contest the matter through three courts, with the certainty of long delay and expense, can be the equivalent of a summary remedy by mandamus, we do not understand. Of course, assuming that it is so, the Court could reach no other decision than that it now announces; but the decision as it stands will certainly be a surprise to most lawyers. At the time of its passage the Riddleberger bill struck almost everybody as a good illustration of the destruction of a right by means which nominally affect only the remedy. It will apparently give repudiating States, cities, and counties, as pointed out by Judge Field in his dissenting opinion, a new and dangerous legal weapon.

THE DEVELOPMENT OF THE DUDE.

When a foreign term is suddenly naturalized we may be sure that there is something in the atmosphere of the place of adoption which makes it convenient and useful. Dude is said to be originally a London music-hall term, but it has been transplanted here, and its constant use shows that it is for some reason well fitted to take a permanent place in the vocabulary of fashion. Many of our readers may not know what a dude is, and some of them, perhaps, do not even suspect his existence. The allusions to him in the press are of that sort which seem to imply contempt—as in the case of the story, bearing evident marks of "reportorial" invention, of a dude pursued up Fifth Avenue by a cat—and yet are, at the same time, obscure. We shall, therefore, to guard against all misconception and suspicion of unfairness, describe what we understand a dude to be.

A dude, then, is a young man, not over twenty-five, who may be seen on Fifth Avenue between the hours of three and six, and may be recognized by the following distinguishing marks and signs. He is dressed in clothes which are not calculated to attract much attention, because they are fashionable without being ostentatious. It is, in fact, only to the close observer that the completeness and care of the costume of the dude reveals itself. His trousers are very tight; his shirt-collar, which must be clerical in cut, encircles his neck so as to suggest that a sudden motion of the head in any direction will cause pain; he wears a tall black hat, pointed shoes, and a cane (not a "stick"), which should, we believe, properly have a silver handle, is carried by him under his right arm, projecting forward at an acute angle, somewhat in the manner that a sword is carried by a general at a review, but with a civilian mildness that never suggests a military origin for the custom. When the dude takes off his hat, or when he is seen in the evening at the theatre, it appears that he parts his hair in the middle and "bangs" it. There is believed to be a difference of opinion among dudes as to whether they ought to wear white gaiters. For reasons we shall presently give, the better opinion is that it is wiser and safer not to do so.

The dude must not be confounded with the Anglomaniac, for though a dude may be an Anglomaniac, an Anglomaniac is not necessarily a dude. It must be admitted, however, that there is in any adolescent Anglomaniac the germ of a dude. A dude cannot be recognized by his conversation, for he has none; and in society, as at present organized, this negative mark is not distinguishing, because the number of people of any kind who have any is admitted to be small and steadily decreasing. The dude is evidently the social successor of the swell, the fop, and the dandy, but the type is a very different one, and it is in this fact that the social interest in him mainly centres. The fashionable types which preceded him—the fops and dandies of our fathers' and grandfathers' time, and the swells of our own—were evolved in an "environment" which does not any longer exist. They devoted themselves to fashion, but it was in a different spirit from that shown by the dude. They regarded exaggeration and extravagance as a legitimate fashionable aim; they brought buoyant animal spirits to the task. Any one who looks at a picture of a fop or dandy of fifty years ago, will see that overdoing the fashions was his ambition. If clothes were important, the more display they made, the brighter the colors, the more numerous the jewels, the more picturesque the whole, the better. Their successor, the swell, at any rate down to a short period since, inherited these traditions, though he did not improve upon them. He struggled against his fate. Pegtop trousers helped him for a time, and so did the fashion of wearing clothes of many colors, and that of swinging a huge bludgeon in walking, while they lasted. But his tale, too, is told, and he has been succeeded by the dude, who actually reverses all this.

The dude's object is not to exaggerate fashions, but to make them less and less noticeable. He acts as if his desire was not to attract attention to himself by any of the peculiarities we have described. His grave, tight costume, his clerical collar, and his general demeanor produce almost the impression of a protest against fashionable folly. He never laughs aloud, or looks gay, as his predecessors used to do. A high-spirited, hilarious dude would be a contradiction in terms. The old race of fops, dandies, and swells enjoyed life, though perhaps in a misdirected way. There is no evidence that the dude enjoys life at all. His manner is that of a young man who has a mission of some kind, from which he is determined that the frivolity of the world shall not turn him aside.

There is something very pathetic and at the same time interesting about the development of a social type of this kind in our busy, noisy, pushing civilization. Society is, as everybody knows, in a highly critical state. Its exclusiveness, its etiquette, its decorum, is threatened on every side. New people, who know nothing about the traditions of good taste in dress and manners, are crowding into it by means of money; the newspapers invade the privacy of home, and, worse than all, a large portion of society encourages them to do so, because newspaper notice has become one of the avenues to social success. Society, which hitherto has preserved and handed down from one generation to another the traditions of refinement, has developed a distaste for refinement and an appetite for vulgarity, which is the explanation, of course, of the fact that no satisfactory answer has ever been returned to the question: "What is society coming to?"

Under these circumstances it is easy to see why the fop, the dandy, and the swell no longer propagate their kind. In our period extravagances such as they perpetrated would lead to their being confounded with their enemy, the cad. This was impossible so long as society excluded the cad. He could prowl round outside and imitate the extravagances of his betters, but he belonged to the vulgar world. With the great headway that vulgarity is making in good society, the cad is procuring his admission to it in large numbers; and in extravagance, hilariousness, loudness, and noise, the cad can always "give points" to the man of refined taste. Had the type which we are considering gone on de-

veloping in the old way, there would soon have been no means of distinguishing between a cad and any one else. Probably in time "cad" would have been used as a term of approval or endearment, just as "fellow" is now. But Nature, in her usual beneficent manner, has provided a way out of the difficulty. As animals sometimes protect themselves against the attacks of their enemies, not aggressively, or by developing new and formidable weapons of attack, but by developing means of escape and obscurity, so, in the struggle to save refined taste and to escape the cad, society may develop a type which the cad cannot overwhelm or vanquish. The dude seems to be such a type. The cad may appear to have been completely successful, but, lo! while he is apparently victorious, the meek, silent, quiet, and refined dude appears by his side, and we see that he it is who is handing down the traditions of "good form" to future generations. The cad may gnash his teeth, but he cannot be a dude, for it is not in his vulgar nature. Verily, the race is not to the swift, nor the battle to the strong; but if our view of the subject is correct, the self-respecting dude, who cares more for the cause than for the lusts of the eye, will never overdo the part, and consequently should not wear white gaiters.

THE OPENING OF THE PARLIAMENTARY SESSION.

LONDON, February 22, 1883.

TILL within the last few years the debate on the Address, in which, according to ancient custom, each house of Parliament replies to the speech from the throne, was an affair of one or two nights' debate, and bore an almost formal character. Occasionally, but very rarely, a strong Opposition moved an amendment, and made the division on this amendment a serious trial of party strength; but even on these occasions the discussion seldom overstepped the third night. Now all this has been changed, and, as has happened in other instances, a change which Irish members began has been followed up and used by the English Opposition. In 1881 and 1882 the debates on the Address, which outlasted the week, were protracted by Mr. Parnell and his friends, who impeached the Irish policy of the Ministry. This year a similar Irish debate was expected. It was known that Mr. Parnell would move an amendment to the Address, and that the opportunity would be taken of complaining of the administration of the Prevention of Crime Act. Most people in England, even those who are more disposed to sympathize with the Nationalists, approve Lord Spencer's conduct, which has been accompanied by a large diminution in the number and gravity of agrarian outrages, and which has been carried out without any recourse to some of the more severe and exceptional provisions of the Crimes Act. However, there are loud complaints in Ireland, where minor errors, which are scarcely noticed in England, attract notice; and even had these complaints been fewer, the Nationalist leaders in Parliament would have been obliged, in order to show their activity, to criticise sharply the conduct of the Ministry and repeat the demand for Home Rule or separation.

However, an unexpected event has completely upset their calculations and the expectations of English politicians. The disclosures in Dublin, obtained from the persons arrested there for complicity in the murders of the last eight months, culminated a few days ago in the confession of Carey, who had been described by Kavanagh, the man who drove the car on which the Phœnix Park assassins came to and escaped from the scene of that crime, as the prime concoctor and manager of the murder conspiracy. A profound impression was made by his revelations, an impression only second to that produced by the event itself of last May. For three days, as his depositions extended over that time, no one in London talked of anything else. The predominant feeling was that of horror and surprise at the existence of so large and well-organized a band of conspirators, at the audacity and recklessness of their schemes, at the bitter hatred which they evidently bore to England. It was a painful surprise, to those who did not know Ireland (and the English generally do know very little about Ireland), to find that these plots had been hatched in Dublin itself, apparently with little assistance from American Fenians, and that the persons who took part in them, and were found ready to carry out the murders, were not professional desperadoes, but ordinary laboring men, or persons belonging to the lower middle class, some of whom, like Carey himself, were not deficient in education or intelligence, and had no special reason for hatred to the Irish Government. However, besides this first and main impression which the disclosures made, there were two other feelings stirred, both of them unfavorable to the Government. The first was of sympathy not only with Mr. Forster personally, as having narrowly escaped the dagger of the assassins, but also with the general view of the Irish situation which he took when he quitted the Ministry, and which was a darker one than they seemed to have held until the fatal evening of the Phœnix Park murders. Many people said that it was now plain that Mr. Forster was right, and the rest of the Ministry wrong.

To this it was answered that these plots had all been formed while he was in power, and under the operation of his own Coercion Act, and that there was therefore no reason to believe anything could have been gained by maintaining it or by keeping Mr. Parnell and Mr. Dillon in prison any longer. However, such an answer produced little effect. People are moved more by feelings than by logic. So the impression remained that Mr. Gladstone and his colleagues had underrated the gravity of the situation, and had got rid of Mr. Forster when, in fact, he was diagnosing the disease more truly than they had done. This tendency was strengthened by the mention made in Carey's revelations of a man named Sheridan as one of the most active conspirators, who moved about in disguise under the name of Father Murphy. Sheridan had been referred to by Mr. Parnell as one of the people by whose assistance he hoped to be able, if released from Kilmainham Prison, to be able to pacify Ireland and discourage outrages. Though it is plain enough to any one who calmly considers the matter, that such a reference proves Mr. Parnell to have been ignorant of Sheridan's real character and conduct, this seemed to many people to be another instance of what they think the blindness of the Government in laying weight on Mr. Parnell's declarations. Here, it was said, was a man whose hands were steeped in blood, scheming a murder at the very moment when he is represented to the Government as an agent who will serve to restore order; and the Government trust the account of him they get, and release the person who vouches for him.

Thus there arose for the Tory Opposition an occasion for damaging the Government too seductive to be resisted. They had not originally intended to protract unduly the debate on the Address. But now the question of the conduct of Mr. Gladstone when the suspects were released in May last, under what the Tories call the "Treaty of Kilmainham," was again opened up, permitting that conduct to be impeached with more effect. The assault was led by the unofficial members of the Opposition, those who may be called its skirmishers, and who claim for themselves the title of the Fourth Party; but it has been taken up to some extent by the recognized Tory leaders, and is not concluded at the date of these lines. So far, it has proved less successful than might have been expected, partly because the events happened so long ago, and no one charges the Government with too much slackness or gentleness in their recent Irish administration; partly, also, because the language and tone of the Opposition speakers have not been judicious. With one or two exceptions they have seemed more anxious to make political capital out of the affair than to treat it seriously as a lesson or warning for the future, or to make it an occasion for inquiring into the real causes of sedition and crime in Ireland. Hence they have repelled that moderate or Whiggish section of the Liberals who were disposed to agree with them in approving Mr. Forster's views and condemning Mr. Gladstone's hopefulness. And there seems no likelihood that the Government will be weakened by these events, although they certainly might have been if all had been known in June last which is known now.

Another result of the disclosures has been to avert the threatened attack on the Government by the Nationalists, and to put the latter practically on their defence. The sentiment of the House of Commons and of the country runs for the moment so strongly against them, and people are so ready to believe, on the scantiest grounds, that they or some among them have been cognizant of the doings and designs of the "Irish Invincibles," that complaints of the Crimes Act or of Lord Spencer's administration generally would produce no effect—would rather move fresh indignation. Hence Mr. Parnell has not yet moved the amendment to the Address of which he gave notice, nor is it known if he will do so. However, he and several of his friends have brought in bills for the amendment of the Land Act, for the establishment of a popular county government in Ireland, and for other parts of the Nationalist programme, which will secure an ample discussion of Irish grievances during the present session. But the time is not auspicious for dealing with them. True as it may be that the best way of permanently pacifying Ireland is to go steadily on in the path of local reforms while maintaining a vigorous administration of the law, the opinion expressed by Lord Hartington that order must be completely restored and crime rooted out before local representative institutions, which might be misused, are conceded, is the opinion now in the ascendant. "What sort of an administration," people ask, "could you expect from local municipal or county bodies, when a man like Carey was chosen a town councillor in Dublin, just because he was known to be hostile to the Government and had been arrested under the Coercion Act?" There is, however, a section of the Liberal party which is prepared to try the experiment; and the question is one of those which may perhaps produce, sooner or later, a split in that party.

Although everything else has been thr[own] into the shade by the startling new[s] poured in from Dublin, while Ke[ogh] Carey were denouncing their [own] two parties which, from diff[erent] condemn the Egyptia[n] which took the opportu[nity] Kavanagh and gave them o[ver] accomplices, the position [of] different points of view, st[ate] policy of the Ministry by which the Address debate arraigning it. From the Tory Opcame the charge that in the earlier ges of the question the Government had been weak and dilatory, while the extreme Liberals

alleged that there ought never to have been any interference in Egypt at all. Both sets of criticisms excited little interest. The result of the matter has been to show how little control Parliament or the country can really exercise upon foreign affairs. The Government declined to answer questions or to declare their intentions during May and June last, when the difficulties were thickening, and when it was not yet clear how they ought to be met—when, therefore, there was still time for Parliament and the nation to express its opinion. They practically made up their minds without having obtained any instructions from Parliament, and asked its approval only when irrevocable steps had been taken. The reason given was the usual reason, that the publication of their intentions would have made action more difficult by showing the enemy what to expect. The Liberal party, supposing they would do what was right, acquiesced in their silence; the Conservative party was not strong enough to compel answers to the questions with which they plied the Foreign Office. Thus the Ministry had it their own way, and now, when the expedition is over and Egypt resettled, criticisms come too late. Probably, in this instance, the result would have been much the same if the Government policy had been known by the people at each of its stages, for Mr. Gladstone's authority would have made his supporters take it to be right. But that does not prevent the case from being an illustrative one, likely to be followed when any similar conjuncture arrives. Foreign policy remains, in fact, the one department of government in which the Executive is not really guided or checked by the Legislature; and this sets people asking whether it is desirable to have so complicated and active a foreign policy. Some have suggested a secret committee of both houses of Parliament, similar to the Foreign Affairs Committee of your Senate, which should be kept informed of what is passing and have a right to express its opinion on the course proposed by Government before it is finally determined. But this is too great a departure from our practice to be likely to be adopted. Apparently we shall have to take the chance, when difficulties abroad arise, of being wisely led by the Government of the day. Some occasion may arrive before long when, as in Lord Beaconsfield's time, the policy of the Government is not really in accord with the feelings of the people, and will lead them where they do not want to go.

Y.

MARIVAUX.

PARIS, February 15, 1883.

IT seems almost incongruous to write a heavy octavo volume on 'Marivaux: his Life and his Works'—640 pages seem like the heavy stone which the boar throws on the man's head in Lafontaine's fable. Is there an author more airy, more subtle, more immaterial, in one sense, than Marivaux? His plays still charm us, because they place us between heaven and earth, in a world of delicate sentiment, of half-expressed emotions, where love is ideal and seems afraid of itself, where all human passion seems to be transformed—more volatile, more mysterious and transcendental. I confess a partiality for Marivaux, and for what has great[ly] "marivaudage"—a form of speech [ha]s been called very different from what [Mo]lière's "précieuses." While it [is] conversation [a]lmost of nothing, [th]ere of the [re]al human and [o]f made [a]n[y] [pe]rieties was the langu[a]ge is always simple, flu[id], this thin veil nevertheless covers [a]n beings, and is somewhat like the Greek d[ra]. on noble and almost divine forms. There [can] be no more delicate pleasure than to see "Le Jeu de l'Amour et du Hasard," or "Les Fausses Confidences," or "Le Legs," well played, as the actors and actresses of the Théâtre-Français can play them. It is a pleasure *sui generis*, which has nothing in common with any other; it is a sensation. It seems delightful to live for a moment with people who can give such an ingenious expression to such refined sentiments, who can feel so keenly and yet be such masters of themselves, who are so *nice*—I cannot find a better term than this, which, alas! has been in our day applied to almost everything. But there was something besides a dramatist in Marivaux—there was a novelist and a philosopher.

Monsieur Larroumet, the author of the volume just published, whose title I have cited, gives us the whole Marivaux. Let us begin with his biography, which is generally unknown. Pierre Carlet de Chamblain de Marivaux was born in Paris, the 4th of February, 1688. His father was a Norman and a financier, and belonged to the *noblesse de robe*. At the age of eighteen, the young Marivaux already felt comedy to be his vocation: he wrote in eight days the "Père prudent et équitable; ou Crispin l'heureux fourbe"—a short act. Private theatricals were the fashion, and this comedy, full of reminiscences of Regnard and of Molière, almost infantine, was played only before a few friends. Marivaux spent the first years of his youth in the salons of the Marquise de Lambert and of the Marquise de Tencin; he was formed in the most charming society. He describes well in his novel, 'Marianne,' the tone of these salons:

"This tone of conversation, so excellent, so exquisite, though so simple, struck me. They said nothing which was not just and proper, nothing which did not belong to a mild, easy, and cheerful intercourse. . . . What I said only imperfectly, they ended by thinking and saying for me, almost unconsciously, and they left me all the honor of it. In fact, they put me at ease; and I, who thought that there were so many mysteries in the politeness of people of the world, and who looked on it as an unknown science—I was quite surprised to find that there was nothing strange in theirs, nothing peculiar, only something obliging, engaging, and amiable."

This is the true "marivaudage"; everything is said without effort; it seems so natural that you feel that you have said it yourself. There is a constant *finesse* in the thoughts and in the expression, but the reader or the spectator feels that this *finesse* has become his own nature; what is objective becomes by degrees subjective.

Marivaux composed a parody on Cervantes, called 'Pharamond, ou les Folies romanesques,' which ridicules the exaggerations of the *précieuses* and of Mlle. de Scudéry; it had no merit, and came rather late after Molière and Boileau. We will say nothing of another novel, 'La Voiture embourbée': Marivaux's talent was not yet developed. He entered on the staff of the *Nouveau Mercure*, and won his spurs in little essays on the manners of his time, on the comparison between ancient and modern writers. He was a partisan of the modern school, and had the bad taste to write a "Homère Travesti" and a "Télémaque Travesti." In these parodies he is much inferior to Scarron; the works are "péchés de jeunesse." D'Alembert, who was also a modern, called the parody on Homer a "literary crime." Speaking later of Marivaux, he says: "It is the shameful part of his life."

Marivaux was already thirty-two years old when he made his début at the Italian Theatre with a play called "L'Amour et la Vérité." The piece was a failure, and has not been printed. "The play bored me more than anybody," said Marivaux after the first representation, "for I am its author." D'Alembert cites this in order to prove the philosophy of Marivaux. He did not learn much from experience; he had a tranquil belief in himself, and often returned to a subject though it had not pleased the public. A short time afterward, he again came before the public with a colossal tragedy in five acts, and in verse—"Annibal." This is the rarest of the plays of Marivaux. I have been collecting them for fifteen years, and I have never found a copy of "Annibal." A tragedy seemed a necessary sacrifice to the muse; every young man made one after college, as he now writes an essay on political economy or on Darwinism. M. Larroumet seems to us very indulgent when he finds a Cornelian accent in some of the ejaculations of "Annibal." Still, he confesses that all this greatness is pure imitation; Marivaux is only himself when he places soft whisperings about love in the mouth of a certain Princess of Bithynia:

"Mon cœur tâcha du moins de se rendre le maître
De cet amour qu'il plut au sort d'y faire naître.
Mais d'un tel ennemi penses-tu que le cœur
Puisse avec fermeté vouloir être vainqueur?
Il croit qu'autant qu'il peut il combat, il s'efforce;
Mais il a peur de vaincre et de marquer sa force;
Et souvent sa défaite a pour lui tant d'appas
Que, pour aimer son trouble, il feint de n'aimer pas."

This is very delicate and very graceful, and this Princess of Bithynia speaks already like all the heroines of Marivaux. "Annibal" had a "succès d'estime": it was played four times. Returning from the French Theatre to the Italian Theatre, Marivaux gave a farce called "Arlequin poli par l'amour." Marmontel justly remarks that Marivaux made much use of the old character of Harlequin, and modified him by showing him in love. The scenes between Harlequin and the fairy and the shepherdess are charming and original. Many of Marivaux's plays were represented at the Italian Theatre. The Italians had established themselves in France in the time of Henri III. They had developed their *commedia dell' arte;* the old types, which were originated by Cæcilius and Plautus, had been gradually modified. They had in Paris mixed French and Italian. Regnard, Lesage had worked for them; they had become the fashion. Henri IV. and Louis XIII. had confirmed their privileges; under the Regent, Riccoboni, an actor famous in Italy under the name of Lelio, had selected a troupe from among the best actors of Antonio Farnese, the prince of Parma; and he had had much success with it in the ancient Hôtel de Bourgogne. Marivaux became a great favorite in this theatre; he assured its fortune, and found in it a liberty which he would not have had at the French Theatre. This liberty allowed full play to his caprice, to his love of fairy-land, of mythological scenes, to his curious analyses of the society of his own time. His interpreters were foreign to all the traditions of the classical school; they were docile, clever; they were admirable mimes. "There are," it has been said, "manners which are worth words; one says 'I love you' with a look, and says it well." The star of Riccoboni's troupe was the famous Sylvia; she was the ideal actress of Marivaux, as "her character was all naïveté, and her grace was all her art." The "Surprise de l'Amour" was a great triumph for Marivaux and for Sylvia; the tone of the "marivaudage" was found, as well as its natural interpreter. From that moment Marivaux kept writing plays till 1746. His repertory contains thirty-two plays, of very unequal value. Some of them bear the trace of too great rapidity of composition. The public of the eighteenth century was more difficult and capricious than our modern public, which swallows everything. "Le Legs," one of Marivaux's best plays, was hissed on the first evening. The success was as complete as it was just with "Le Jeu de l'Amour et du Hasard," "L'Épreuve," "La Mère confidente," "Les

Fausses Confidences." Marivaux had a great partiality for the Italian Theatre, but he felt obliged at times to give a piece to the King's comedians. He was afraid of them, of their severity, of their traditions; his dear Italians were much more indifferent and obedient. He liked the classical types of Lelio and Sylvia, of Harlequin and Columbine, of Lisette and Frontin, of Ergaste and Lucile; they were like familiar masks, like uniforms which he found convenient. It was with a sort of alarm that he composed great pieces in five acts, in the manner of Regnard, like the "Serments indiscrets."

Till the year 1722 Marivaux could write leisurely, in his own time; he had a respectable fortune left him by his father. But, alas! he allowed himself to be tempted by the great schemes of John Law; his fortune was first doubled, and then he was completely ruined. He bore his misfortune with the greatest philosophy, though he had been married a short time before. He lost his wife after two years of a very happy union; she left him a daughter, whom he educated with great care. She took vows, and, as she was poor, the Duc d'Orléans gave her a sum of money which allowed her to enter the fashionable abbey of the *Trésor*. Marivaux was then living on a pension of three thousand livres, which the King had given to him. He tried in vain to increase his resources by publishing a weekly paper, under the title of the *French Spectator*. Marivaux could not well conduct a weekly paper; he did not like this new work; he could not torture his brains and draw thoughts from his barren mind. After two years the publication was stopped. He attempted twice more to issue weekly papers, under the odd names of *L'Indigent Philosophe* and the *Cabinet du Philosophe*, but failed each time. He was not more successful as a novel-writer; his 'Vie de Marianne' is, however, a masterpiece—that is to say, in some senses. Unfortunately, it appeared in separate parts, and the publication lasted sixteen years. How could the attention of the public be captivated during so long a period? He did not even finish this extraordinary novel; he allowed Madame Riccoboni to finish it. Richardson had certainly read the 'Vie de Marianne,' for Marianne is a handsome girl, persecuted by bad and dangerous people, who escapes by her energy and uprightness from all the dangers which surround her. Marianne, however, is very different from Pamela; she is more proud, more *spirituelle*, more sure of the power of her charms, while Pamela is unconscious of her beauty, modest, timid, and triumphs only by her softness and by her humility. 'Marianne' might be called the code of seduction; it describes a society and a time when seduction seemed the first, the only object of life. It is impossible, I believe, to form a perfect conception of French society of the time of Marivaux without reading 'Marianne.' Another novel of Marivaux's, the 'Paysan parvenu,' is not without some analogy with 'Joseph Andrews' and with 'Tom Jones'; but it is very inferior to the 'Vie de Marianne.' I will not speak of certain other novels; 'Marianne' is really the only one which has survived, and which has gained and is gaining every day in reputation.

In another letter I shall have something to say of Marivaux's relations with the philosophers; it is a serious chapter of the literary history of the eighteenth century.

GNEISENAU.

BERLIN, January, 1883.

THERE is hardly a prominent German general who more deserves to be known everywhere and who is so little noticed abroad as Gneisenau. I have asked English and American, French and Italian learned officers, gentlemen who had studied the wars of all ages, but none of them had ever heard of Gneisenau. To foreign observers, all the merits of this noble soldier were overshadowed by the great fame of old Blücher. They were evidently satisfied with the study of his campaigns and victories, without troubling themselves much about the great genius who prepared them. I do not reproach these gentlemen for their neglect of Gneisenau—the less so, as this great planner of battles was not much known by his own army, and seldom appeared at the front. Even in the campaign of 1813, his wife asked him what kind of general he was, as his name never appeared in public. Thus, the memory of his real standing and of his immortal merits was confined for a long time to a small circle of historical students, to military academies and schools, and to incidental remarks of military critics.

Finally, German historiography has rescued Gneisenau from oblivion, and has assigned to him the honorable and enduring place he deserves in the history and in the hearts of his people. Pertz's great 'Life of Gneisenau,' in five large octavo volumes—of which the first three were compiled by him, while the last two were finished by the author of the work named below—is a book which excels by its rich materials, but is in all other respects an awkward and clumsy publication. Besides, Pertz's mind is too narrow fully to do justice to his hero; he flatters those who are or were in power, or detracts from those whom he does not like. Pertz has not written a book, but has carelessly accumulated a heap of raw materials. Thus his work is the worst kind of biography. Unfortunately, Mr. Delbrück, without destroying the unity of the plan, could not do much to correct the tone of the two last volumes. But, just as Professor Seeley, in his 'Life of Stein,' has written a very readable book—chiefly drawn from the seven large volumes of Pertz's 'Life of Stein' and other materials—so Mr. Delbrück has now worked over Pertz's materials about Gneisenau into a very creditable shape.* The author is a young historian of great promise, well versed in the literature of the Napoleonic age, and in the rich German contributions to the more intimate knowledge of its character. Besides, he is a fluent and able writer and a sound critic. He has thus enriched German literature with the first good and comprehensive life of Gneisenau, the translation of which I would most heartily recommend to an enterprising American publisher.

Little is known about Gneisenau's early life, and that little is so much interwoven with fables and fiction that it rather reads like a romantic tale. Whether his name was Neithardt or Gneisenau, or whether both names composed the whole, is uncertain; where he came from is rather mythical. The family is said to have been driven out of Austria for its Protestantism. Gneisenau's father, who first called himself simply Neithardt, was a lieutenant of artillery in the contingent army of the imperial circles (*Reichsarmee*) which, during the Seven Years' War, made itself ridiculous by its behavior and exploits. He married, at Würzburg on the Main, against the will of the father, the daughter of a Lieutenant-Colonel Müller, a well-to-do man and strict Catholic. The young wife followed her husband into the field. It was a few days before the battle of Torgau that, in the little town of Schilda, on October 28, 1760, she was delivered of a boy, who was baptized Augustus, and who is the subject of this sketch. When a few days later, in consequence of the Prussian victory, the Austrian army hastily retreated by way of Schilda, the young mother, with her infant, was put on a baggage-cart. The boy glided from her arms and fell on to the road. A soldier accompanying the train picked him up, carried him till daylight under his cloak, and gave him back to his fainting mother, who soon after died from exhaustion. In after life, Gneisenau jestingly remarked that he even did not know whether he was himself, as on that night he might have been exchanged with another baby. The father, a thriftless adventurer, who had to march off with the retreating army, left his boy with a peasant of the neighborhood. Here the later field-marshal was roughly treated, learned little or nothing, had, it is said, to mind the geese on the common, and was happy when he got enough black bread to eat. Finally, his grandfather, still living at Würzburg, in some way or other was informed of the whereabouts of his grandson, and sent for him. He now was nine years old, and entered into a house of ease and comfort. From this time we have a real historical basis for Gneisenau's life.

He remained with his grandfather, who died as Colonel in 1772, and quickly made up his deficiency in his early education. The father had in the meantime married again, and established himself as an architect at Erfurt, to which city the son soon followed him. On October 1, 1777, young Gneisenau was, as "Anthonius Neithardt Torgaviensis," and as "stud. philosophiæ," matriculated in the album of the Erfurt university. Here he led the happy life of a student, spent in a very short time the grandpaternal inheritance, and was nearly penniless, when in 1779 he left the university and joined the Austrian Army, a regiment of which, the "Wurmser Hussars," was then stationed at Erfurt. Why he left it a year later is not known. Recommended, however, by Dalberg, who was then deputy-governor of Erfurt, Gneisenau, in the winter of 1780–81, took service with the Margrave of Ansbach-Bayreuth in a regiment of chasseurs which this prince, in 1782, hired to the English Government to fight against American independence. Second-Lieutenant Neithardt von Gneisenau—for such is now his name in the regimental lists—was the next youngest officer of his regiment. Toward the end of April, 1782, it left the Weser and sailed for Halifax, from which place it was sent to Quebec, where it remained several months.

The war having practically been ended, Gneisenau never saw the enemy, and spent his time in studying and observing the character of the American war, and in daily intercourse with experienced and able officers. Here he first became convinced of the great importance of the skirmishing and sharpshooting mode of fighting, which formed one of the characteristics of the American war. It was the method best adapted to the colonists, and consequently developed by them into the formation of light infantry battalions, in opposition to the close lines and masses which were still in vogue during the Seven Years' War. By their engagements with the Indians they were accustomed to isolated and scattering fighting, and in the Revolutionary war, availing themselves of every advantage of ground, they gained final success over the close masses of the English. Burgoyne's surrender at Saratoga was caused in a great degree by this system of fighting, the masses of skirmishers having decided the fate of the day. To guard against similar disasters in future, the English increased the number of their light troops, and exercised their light infantry in skirmishing and fighting in extended lines. On the American side, Steuben picked out the best and most tried soldiers, and, as light infantry, made them the model corps of the entire Army. Foreign observers and masters of the art of war at once appreciated the great value of this improve-

* *Das Leben des Feldmarschalls Grafen Neithardt von Gneisenau.* In zwei Bänden. Von Hans Delbrück. 8vo, v.-378, vi.-359. Berlin: Georg Reimer. 1882.

ment, and transplanted it from American to European soil. Frederic the Great first in Europe laid the foundation of light infantry in the last years of his reign, by the creation of three light-infantry regiments, and the employment of several Brunswick, Hessian, and Ansbach officers who had taken part in the American war. His successor extended the new formation in 1787 to twenty battalions, under the name of "Fusileer Battalions," and gave them, in 1788–1789, the first written regulations on rifle-practising and skirmishing, for which the examples of the American war served as a basis.

Gneisenau was one of those officers, and on January 1, 1786, on his application, was appointed first lieutenant in a newly-formed Silesian light infantry regiment, although he would have preferred to be attached to the quartermaster-general's department. It is an interesting fact that the greatest of the men to whom Prussia is indebted for resurrection from a low but well-deserved fall were not native Prussians. Attracted by the fame of Frederic the Great, they offered him their services. Baron Stein came from Nassau, Prince Hardenberg from Hanover, glorious old Blücher from Mecklenburg, Scharnhorst (a modest yeoman's son) from Hanover, and Gneisenau from Franconia. During the twenty years of peace which now follow in his life he studied mathematics and history, or spent his free hours in agricultural pursuits near his garrisons—small towns like Jauer and Löwenberg, in Silesia. The war of 1806 was of short duration. Gneisenau, since 1803 a major, was present at Saalfeld, and received a bullet in the leg; he was likewise present at the ignominious Prussian defeat of Jena. He distinguished himself on the retreat, carried out several royal orders with great credit, and first began to attract the attention of prominent generals and leading statesmen, and even that of King Frederic Wilhelm III. Called to headquarters, Gneisenau made plans for a new campaign, was sent to Poland to organize the armed resistance against the French, and a little later, with two battalions, to Danzig, to reinforce the garrison of that place. In April, 1807, he was ordered to replace a stiff old martinet, Colonel Lucadon, the commander of Colberg, and to proceed at once to that most important fortress on the Baltic, which alone kept open the communication of Prussia with Sweden and England. From February till July, 1807, it was besieged by the French generals Teulié and Marshal Mortier with from ten to sixteen thousand men. Gneisenau kept the place valiantly till July, when the peace of Tilsit put an end to hostilities. He was the first Prussian commander who appealed to the patriotism, the unselfishness, and devotion of the citizens, and found in them enthusiastic coöperators in reaching his end. By doing away with the old system of flogging and cruelly drilling the soldiers, he soon gained their confidence, and was thus enabled to ask the most heroic efforts and patient endurance from them.

In short, Gneisenau was the first citizen-soldier in Prussia, and won a national reputation by his successful defence. It made Blücher his friend, and secured him the confidence of the generally distrustful King, who made him one of the members of the commission appointed for the reorganization of the Army, and at the same time (with the rank of colonel) inspector of the corps of engineers and of the fortresses. As such, he was the most efficient coöperator of Scharnhorst, and, in company with him and Clausewitz, laid down the firm basis for the first and greatest national army of Europe. He made the people a people in arms, not enlisted by bounties paid to the scum of society or to the dupes of recruiting sergeants, but consisting of the youth of the nation, without distinction of rank. Gneisenau, although contributing his full share to the great reform, modestly called himself a pigmy beside Scharnhorst. When, in 1809, yielding to necessity, Prussia remained neutral in the war between Napoleon and Austria, Gneisenau asked his discharge, and obtained it for the duration of peace. With the secret pecuniary assistance of the King, he went to England, and thence to Sweden and Russia, to concert means to shake off the yoke of Napoleon; but on account of the Austrian defeat and the failure of the English expedition to Walcheren, his efforts were everywhere futile, so that the indefatigable man, after a year's absence, had to return home.

In February, 1811, Gneisenau was again invited by Hardenberg to reënter the service, the war between Napoleon and Russia being imminent. Scharnhorst had been sent to St. Petersburg to propose an alliance with Russia, and Gneisenau was ordered to draw a plan of common defence, which he finished in August, 1811. He advocated a war to the knife: "Better die beaten with arms in hands than live in voluntary servitude," was his motto. The King, however, averse to all decisive steps, rejected Gneisenau's aggressive plan, and even entered into an alliance with France, after Russia had haughtily rejected Prussia's offers. Patriotic officers like Scharnhorst and Clausewitz refused to serve as French vassals, tendered their resignation, and went to Russia. Gneisenau, too, in March, 1812, obtained his discharge from the Army, but went on a secret mission to Austria, Russia, Sweden, and England, trying once more to prepare treaties for common attack of and defence against Napoleon. He was just on the eve of concluding a treaty of subsidies with England when the news of the rising of the people called him home. On February 25, 1813, he landed at Colberg, the cradle of his fame. On March 16, the date of the declaration of war against Napoleon, the King appointed him major-general and second quartermaster-general to Blücher. In this capacity he acted at Lützen and Bautzen, while, during the armistice, he organized in Silesia sixty-eight battalions of Landwehr infantry and forty companies of cavalry. After Scharnhorst's untimely death, Gneisenau was promoted to be chief of staff of the Silesian Army. From this time to the Peace of Paris his deeds form part of the history of the world.

It would lead me too far were I, even in relation to Gneisenau only, to specify here the particulars of the campaigns of 1813, 1814, and 1815. The most daring and audacious of all generals, he was the soul of that army which, although the smallest of the allied forces, by assuming the offensive, became the originator and leader of concentrated action against Napoleon. Blücher performed to the letter what Gneisenau planned; they were one soul and one head. The enthusiastic confidence, the most cheerful and heroic fatalism, united the two generals, who, even in the darkest hours of the war, acted with the most implicit faith in its ultimate result. "A lasting peace can only be concluded in Paris," was the parole given out by Gneisenau while still in Silesia. "Forward to Paris!" was the war-cry with which Blücher inspired his troops. They never were jealous of each other; the one formed the complement of the other. When, in 1814, they both visited England, Blücher was made Honorary Doctor by the University of Oxford. "Well," said the old hussar, who from hearsay only knew doctors of medicine, "I will make it all right, as long as I have an apothecary who makes as good and efficient pills as Gneisenau." When, at about the same time, the city of London gave a public dinner to their celebrated guests, Blücher, in answering a toast, asked the party present: "Who of you, gentlemen, can kiss his head?" As he received no answer, the fine old fellow went to the other side of the table and kissed his friend Gneisenau.

Mr. Delbrück gives a plain and exhaustive narrative of the several campaigns, and illustrates them with little maps, so that the general reader can easily follow and understand the march of events. The war, it is known, ended with the battle of Waterloo. It was here again Gneisenau, who, by his intuition and energy, prepared the final victory. He advised Blücher, who had just been beaten at Ligny (June 16) not to fall back upon his natural line of retreat on the Maas, but, in the teeth of the enemy, to unite the whole Prussian Army with that of Wellington. He thus correctly appreciated the character of Napoleon. "I know my man," he explained to Blücher; "he will and must concentrate all his forces in an attack on the English, in order to beat them before our arrival." "Old Marshal 'Forward'" carried out his friend's advice with the vigor of a young man, and just in time effected his junction with Wellington — an operation which Napoleon had thought impossible, and which decided the war against him. After the battle, Gneisenau persistently followed the beaten enemy with such energy that he made his flight a still more crushing defeat, and sealed the doom of the Empire long before Napoleon arrived near Paris. "The tyrant will be delivered up to me," wrote Blücher on June 27, 1815; "I shall render a great service to humanity by having the wretch shot. It will be the most useful for him, too." The Marshal would have kept his word if Wellington had not interfered on Napoleon's behalf.

Ten years later, in commemoration of the great Waterloo victory—viz., on June 18, 1825—Gneisenau was made a field-marshal, the King, in 1815, having made him a count and bestowed a large estate on him. He afterward held several high offices of trust, and died in 1831 of cholera as Governor of Posen. Gneisenau was a noble character, an earnest scholar, and a humane soldier. Only once in his life did he shed tears. It was when he rode over the battle-field of Leipzig and saw the poor victims of war in their blood and last agony. History has few characters of such purity of mind, of such noble aspirations, and of such modest but effective devotion to their country. He was a self-made man, who, by following the intuitions of his genius, achieved immortality. † † †

Correspondence.

THE TARIFF ON FOREIGN IDEAS.

To the Editor of The Nation:

Sir: In view of the perils to which American morals are exposed from foreign books and foreign ideas, as represented by the petitioners referred to in your editorial of February 22, it does not seem a sufficiently radical measure to merely impose a duty of twenty-five per cent. on foreign literature. Men who are wicked enough to pervert their own and other people's minds by such means will not hesitate to pay this duty. If we have no use for the thought and experience of the civilized nations of Europe, or if, as some claim, we are better without, Congress ought not only to absolutely prohibit the importation of foreign books, but also to interdict the teaching of all foreign languages. When a man can read French, or German, or Italian, you can never be sure that he will not read something in one or another of these languages for which he and the community may be the worse. There is a good deal in English literature that is not conducive to mo-

rality, and most of this has been produced by foreigners; but it would perhaps not be wise to try to exclude this too, or prevent people by legislation from reading it. In the matter of literature and art, a large number of Americans seem to be of opinion that a new thing is to be judged, not by its intrinsic merit, but by its paternity. They must be greatly pained at the strong influence exercised by French, and especially German, thought in some of our foremost writers, past and present. Possibly the influence was not wholly bad, but that it was foreign is enough to condemn it. Let Congress by all means at once come to the relief of these sensitive souls. C. W. S.

ATHENS, O., Feb. 28, 1883.

FARMER AND CITIZEN.

TO THE EDITOR OF THE NATION:

SIR: It is quite evident to all your readers that the writer of the article entitled "The Press and Agriculture," which appears in your last issue, has no taste for rural pursuits. While every sensible man will doubtless admit that an undue glamour of sentiment has been drawn around the farm by the poets and literary men generally, yet he will as surely combat many of the positions taken by the writer referred to. The picture drawn by the "Tennessee Farmer's Wife" may be true in the main as to farm-life as followed by the farmer of one hundred years ago, and his descendants of the present day who refuse to learn, or place themselves among the progressive producers of the age. The man who farms to-day on the old grinding plan; who scrapes all he can get off the land; who turns up his nose at "book farmers"; who sneers at "artificial fertilizers" and drainage and blooded stock; who would rather raise the commonest grades than Jerseys; who would sooner feed the gross Asiatic fowl than the more profitable Leghorn or Houdan, will surely and certainly grow poorer every day, and, especially if his tastes are foreign to his employment, he will not "have a pleasant or easy life at all."

There are, however, plenty of men engaged in agricultural pursuits at the present day (and their number is daily increasing) who find an ever-increasing pleasure and enjoyment in farm-life, because they have an absorbing interest in their work, and are enabled to interest their families and friends in the same. There are plenty of women (and their number is daily increasing) whose ideal of existence is anything but "concert and opera and unlimited magazine reading," who are striving to make their homes centres of light and refinement, and who manage to make life to themselves and all who are around them anything but a flat, vapid existence.

I do not mean to deny that there are many who are dissatisfied with their mode of life; neither will it be denied, I presume, that there are many women, and men too, in the cities pining for some other way of living. Every one in the world at times imagines any other mode of living more pleasant than his own. Man is a restless, discontented being naturally, and will never find paradise this side the grave; but that condition will be the nearest to it in which he finds his greatest comfort and happiness. Moreover, there is no occupation in this life, that holds out any hope of success, in which there is not plenty of hard work; and those you speak of—"the middleman, speculator, and monopolist"—"who build up colossal fortunes," are few and far between when compared to the great mass. Farmers will hold their own, in comparison, as well as other avocations. As to the malaria, better food, and higher spirits, there is also a large margin for argument. One might suppose that your writer was picturing a period one hundred years ago, or describing the agricultural life in Ireland of the present day.

As to advice for young men, no one (and I believe newspapers, as a rule, are careful in this respect) should presume to counsel a young man as to his future without knowing something about his tastes, habits, and abilities; and the care (as to city or country) should be as much on one side as the other. Any one who advises young men to come to the city for professional study, for example, in our day assumes a grave responsibility. In Philadelphia, it is said, there are about 1,500 members of the bar; about 250 of these are in active practice, and probably not more than twenty have more than a local reputation. The same could doubtless be said of doctors, dentists, and engineers. The professions are overcrowded; land is plenty, "but the harvesters are few." The great progress made in the past few years in manures, fruit-raising, dairy products, and machinery, and labor-saving machinery of all kinds, and in all the departments of the farmer's labor, have wrought a great change in agriculture. The man who is alive to the present, who reads the agricultural papers (in which there has been a wonderful advancement), and systematizes his business, and gives it the thought and earnest care that he would bestow in other trades or professions, will as surely succeed, and, if he does not build up a colossal fortune, like the monopolist or speculator, will have the consciousness of a life well and rationally spent, and time usefully employed. FARMER.

PHILADELPHIA, Feb. 20, 1883.

THE SETTLEMENT OF MARYLAND.

TO THE EDITOR OF THE NATION:

SIR: Some statements about Maryland in the article on "Migrations of American Colonists," in the *Century Magazine* for March, could hardly have been made if the article had been written since the publication of Doyle's 'English Colonies' and Bancroft's "Last Revision." Let me contrast a few of the magazine statements with those of these histories on the same points:

"In its motive and mainspring, the first Maryland settlement was Roman Catholic. The non-Catholics in Calvert's company were for the most part people of no great consequence, and without strong religious convictions" (*Century*, p. 730).

"Baltimore does not seem to have been reduced, like almost every other colonizer who had gone before him, to stock his community with the scum and offscouring of the old country. In this respect, we cannot doubt that he gained by following in the footsteps of the Virginia Company, and, in a less degree, of the New England Puritans" (Doyle, 'Eng. Col.,' p. 283).

"Upon the 27th, the emigrants, of whom by far the larger number were Protestants, took quiet possession of the land" (Bancroft, "Last Rev.," p. 161).

"Our fathers were not only Christians; they were, even in Maryland, by a vast majority, Protestants" (*ib.*, p. 610).

The colonization took place in February, 1634 (N. S.), and in 1635 the Protestants had religious convictions strong enough to protest to the English authorities against the celebration of Mass in public. It was one of these "people of no consequence" who made protest to the King, in the presence of Archbishop Laud—viz., Jerome Hawley, one of the first commissioners, who shared responsibility with the Governor. Another (Protestant) first commissioner, Thomas Cornwallis, was the most influential planter in the colony. Others of the same grade of influence were Justinian Snow, the "Factor," and Henry Fleet, the Interpreter. The gentry have been overstated as to numbers, and especially the Catholic proportion of them. Hildreth was the first to reduce the over-statement to this: "Several Catholic gentlemen, with their indented servants." Bozman, in his 'History of Maryland,' gives the names of thirteen, besides the commissioners, and adds: "The most, if not all of them, were Roman Catholics." But of these, five soon died, and so much Catholic influence died with them, and another went to Virginia. A letter before me, from one who knows Maryland history from the original sources, says: "Besides the two Jesuits, the number is narrowed down to about a dozen, and the most influential were Protestants." The whole number of "the few persons above the condition of laboring men" is given in Neill's 'Founders of Maryland' as twenty, including the Protestant gentry and the six Catholics who disappeared in from one to three years.

Besides making their religious convictions known at court, the following facts show how strongly the Protestants expressed them at home:

"Notwithstanding there was no Church of England minister in the Province, the Snow family and other Protestant Catholics appear to have held religious services. Surgeon Thomas Gerard [son of a Catholic planter], whose wife and son-in-law were decided Protestant Catholics, had legal difficulties in 1642 relative to the use of a chapel, probably growing out of his position as acting administrator of the estate of Justinian Snow.

"David Wickliff in March complained to the Assembly, in behalf of the Protestant Catholics, that Gerard had taken away the key of their chapel and removed the books. The case was heard, and he was ordered to relinquish all title to the chapel, to restore the books, and pay a fine of five hundred pounds of tobacco for the support of the first Protestant Catholic minister [*i. e.*, English Churchman] who should settle in the Province" ('Founders of Maryland,' pp. 99, 100).

Bozman says: "This exaggerated fine upon him demonstrates that the Protestants—supposing them to be of the Church of England only—must have possessed, at this early period of the settlement of the Province, a very great influence therein" (vol. ii., p. 200).

The article in the *Century* is plainly correct in saying that "the Catholics were at length but a small minority"; but from the most recent and trustworthy investigations, it is plainly incorrect in following the old exaggerations about their original preponderance. And the assertion that, "in about twenty years after Governor Calvert's landing at St. Mary's, the ultra-Protestant element, inflamed by the bitter conflict of parties in England, became sufficiently powerful to . . . expel the priests from the Province," overlooks the fact that Father Andrew White, one of the first two Jesuits, was sent a prisoner to London nearly ten years before, when as yet all Protestant elements were combined against the King; and earlier still men were fined in Maryland for speaking disrespectfully of the Church of England. This certainly was not due to the ultra-Protestants.

Until within a few years, the historians have not recognized, as their authorities do, the influence of Protestants, and especially Churchmen, in Maryland from the first.—Yours,

GEO. F. MAGOUN.

IOWA COLLEGE, March 2, 1883.

FENIMORE COOPER.

TO THE EDITOR OF THE NATION:

SIR: I wish to call your attention to an article in your paper on Mr. Lounsbury's biography of Fenimore Cooper. The writer says: "Cooper's life was one prolonged and furious quarrel with his critics and neighbors"; and again, that "it is undisputed that Cooper had a hot temper and liked to quarrel." Both these remarks tend to give a wrong impression of the man, and are

therefore unjust. It is true that for a few years he was engaged in lawsuits with certain newspapers, because their reviews of his books took the form of personal abuse. He attempted to restrain the license of the press. He threw himself, with manly courage and energy, into that terrible vortex that always surrounds a reformer. What some might call a "hot temper" was only righteous indignation against all meanness and wrong-doing. He was a true American and proud of his country. Though he freely spoke out its faults when he returned to it, yet, while living abroad, he never heard a word against it without a manly and patriotic protest—which cannot be said of all our countrymen abroad. In his private relations he was to his friends always frank, honest, and true, to his family a tender and considerate husband and father; and it is a pity that this side of his character cannot be more fully known. These few lines are written by one who knew him only in the later years of his life, who, though admiring his genius, thought far more highly of his honest, manly, independent character. A.

NEW YORK, February 28, 1883.

PROHIBITION AGAIN.

TO THE EDITOR OF THE NATION:

SIR: You do not deny, in your issue of February 22, that prohibition in Iowa means only the prohibition of keeping a saloon, or running a brewery or distillery to supply a saloon with intoxicants for sale as a beverage. The temperance people who had the measure for submission to popular vote passed through the Legislature, had sense enough to strike out the words, "or to be used," although the journal of our House failed to record it, and thus gave the Supreme Court technical ground to declare the amendment void. They knew that they had no right to forbid the use of intoxicants, because that would be an outrage of personal liberty; but they knew that they had the right to ostracise by law all traffic in intoxicants, and decided to do so by thirty thousand majority.

The "tendency to be uncandid and sophistical" is not limited to temperance agitators. For instance, when you draw a comparison between the prohibition of intoxicating liquors and the prohibition of potatoes, you lay yourself liable to criticism. The former are luxuries, the latter a necessity. You make the same mistake that Lord Palmerston did, who could never understand why ale and gin should not be free articles of commerce, like treacle and vinegar. But, even in conservative England, Lord Palmerston's sophistic reasoning upon this important subject was exploded and repudiated.

Prohibition in some form or other is the aim of the American people of Iowa. Why? Because the liquor traffic is a glaring, unmanageable wrong. The State cannot undertake the education of the morals, appetites, and passions of its people, to say nothing of the foreigners who seek our shores and leave their moderation behind. The American people are a realistic people, and want to strike the evil right on the head; and its head is the saloon—the rest are only accessories. ERNST HOFER.

MCGREGOR, IOWA, Feb. 26, 1883.

[This letter gives us a feeling of despair. But we will try again before resorting to a chisel and hammer. We said "potatoes," by way of illustration, in the hope that by using this familiar vegetable we should make the argument easier to Mr. Hofer's comprehension, and without the smallest reference to the place they occupy as an article of human food. We now inform him that their nature or use or name has absolutely no connection whatever with our point. Anything else—sawdust or cat's-meat—will do as well. If he knows anything of algebra, the letter *a* will do. We now vary the illustration by saying, that if it were *a* which was under discussion, he would never indulge in the sophistry in which he indulges with regard to *b*, that a prohibition against the sale or importation of the article within the State was not an interference with the liberty of the person wishing to use it. What we sought to convey was, that his mind was so twisted on the liquor question that he was more liable to fall into fallacies and sophistries about liquor than about any other article of human desire or use.—ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: By the courtesy of the *Nation*, I should be glad to add this much to my former communication. When men's thoughts are earnest and forceful, they easily become narrow and extreme. The difficulty inheres in the feebleness of our rational and moral faculties, and belongs hardly more to those who push reform than to those who oppose it. It follows from this fact that no cause is to be held responsible for any methods or conclusions save those which logically inhere in it; and no person is chargeable with any opinion save those he has expressed or clearly implied. If we were to wait till a wise thing could be done wisely, a good thing prosperously, we should be found standing on the shores of an old world, casting wistful eyes over a waste of waters in search of a new world.

It is difficult to understand how any one should suppose that any other force than a moral one must be first and last in the temperance reform. All that the prohibitionist need claim is, that when society in its progress encounters appetite and avarice which are not open to moral truth, which are acting, under the sanction of law, to debase society, society has both the right and the duty to put its own laws on its own side.

It is plain that prohibition necessarily restricts in a very considerable degree the indulgences of persons—indulgences which, in themselves considered, offer no occasion for the intervention of law. For one, I should neither cherish the purpose nor the wish to restrain a strictly temperate use of intoxicants by law. This fact, that prohibition goes further than the evil involved, must be fully admitted by the prohibitionist. The necessity of the case is his justification. The appetitive enjoyments of a few are not, to his mind, comparable gains with the innumerable losses and dangers which accompany them. It is equally true, however, that this restriction is not the object of prohibition, but only its incident. It is not fair to speak of it as the end in view. The criminal who is imprisoned may leave parents or children without support: he is not imprisoned for that very purpose. The deterring consideration to the wise prohibitionist is this very thing, the private and social pleasures of many worthy citizens; that with which he weighs down this objection is the unmeasured gain of all men by temperance—temperance enforced by public sentiment, and in due time fortified by law. He no more here than elsewhere expects to win great good without some evil.

JOHN BASCOM.

UNIVERSITY OF WISCONSIN, MADISON, Feb. 28, 1883.

Notes.

S. E. CASSINO & Co., Boston, announce a "Standard Library of Natural History," or popular encyclopædia of the animal kingdom, of which the editorship will be in the competent hands of Dr. Elliott Coues and Mr. J. Kingsley.

The 'Life of Bishop Wilberforce,' which has made so great a stir in England on account of the editor's indiscretions, will be shortly published here by E. P. Dutton & Co., in one volume.

J. B. Lippincott & Co. have in press the 'Odes' of Horace, translated by Henry Hubbard Pierce, U. S. A.; a 'History of the Union League Club of Philadelphia'; 'Miracles of the Saints,' by E. Cobham Brewer, author of the 'Readers' Handbook'; and 'Insects Injurious to Fruit,' by Prof. William Saunders.

Mr. Louis Kempner, 5 Clinton Place, New York, has compiled from the *Nation* a pamphlet of forty pages, including the principal contributions to the discussion over 'Unpunished Homicide at the South.' It is well calculated to be of service to those earnestly desirous of abolishing the scandal in question. Mr. Kempner advertises that he will publish this month the first number of a new weekly journal devoted to political culture and the interest of American students, called the *Student and Statesman*.

Forestry Bulletin No. 25, Tenth Census, is devoted to the forests of West Virginia, which are principally composed of broad-leaved trees, with white and chestnut oaks as the most important. The white-pine area exceeds 300 square miles.

The annual report of the Connecticut Agricultural Experiment Station for 1882 possesses the usual interest for farmers, particularly in the section on the comparative analysis of ensilage and fresh fodder. The new and stringent Connecticut legislation as to the sale and declaration of fertilizers will attract the attention of law-makers in States which have not yet established experiment stations. Last year (the sixth in its existence) the Connecticut Station was provided with independent buildings and grounds in a New Haven suburb at the State's expense.

Boston University, of which the President's Annual Report lies before us, is to be congratulated on having acquired its first permanent hall, well built and equipped in every way, as appears, and on Beacon Hill. The report, like its predecessors, has much irrelevant fine writing.

The *Chrysanthemum* (Yokohama: Kelly & Co.; London: Trübner & Co.) began its third volume in January with a change of form and style, both for the better. This number is an excellent one. Mr. T. W. Blakiston continues his valuable "Ornithological Notes"; Captain Brinkley contributes the first chapter of a "History of Japanese Ceramics"; and there is a first instalment of a translation from a paper by Dr. Adolf Groth, of the Medical Department of the University of Tokio, on (*pace* Dr. Dix) the "Higher Education in Japan." In addition to the foregoing, the reader is treated to fiction, history, and literary reviews of good quality; and finally, a native retrospect of the course of events in Japan, "The Old Year," is compiled from the summaries of the *Nichi Nichi Shimbun* and other vernacular journals.

In the January *Bulletin de Correspondance Hellénique* published by the French School at Athens, will be found an article by Mr. W. J. Stillman, describing a remarkable engraved cuirass found in the bed of the river Alphæus some fifteen or twenty years ago. It was so covered with a chalky deposit that its value had escaped observation till Mr. Stillman saw it and with infinite pains removed the preserving crust. Three heliogravures of this interesting piece of armor, which bears the marks not only of elegant workmanship, but of hard service in battle, accompany the description. The incised decoration consists in part of figures of Apollo, Latona, and Artemis, with a counterbalancing group,

in part of bulls and lions facing each other ; and finally of two rampant and opposing sphinxes and two leopards in the same attitude. A lotus forms the centre of an ornamental border, and the general effect of the design is Eastern. Mr. Stillman regards the work as of purely Greek origin, however, and assigns it to the sixth century B. C., and, on account of the rampant beasts, associates it as to its source with the lions of Mycenæ. The composition of the bronze is excellent in a high degree. The rims of the armholes were rounded upon iron wire now completely oxidized, and only discoverable by chemical analysis.

Bulletin No. 1 of the "Société Historique et Cercle Saint-Simon" contains, in President Monod's retrospective address in November last, a clear account of the origin of this promising club of men of letters, whose chief but not exclusive bond is a fondness for historic studies. The *Cercle* is now well and commodiously lodged in a building on the Boulevard Saint-Germain, No. 215, and Rue Saint-Simon, No. 2—this latter circumstance suggesting the name which has been adopted, and which, as M. Monod says, will please both the friends of Old France and the adversaries of the *ancien régime*. On the 31st of October the Society offered a "punch d'honneur" to M. Savorgnan de Brazza, and the toasts and speeches on that occasion are reported in the Bulletin. So is a lecture by Prof. Albert Sorel, delivered November 25, on French Influence in Europe on the Eve of the Revolution. Finally, the constitution and by-laws of the Society, with lists of its officers and extensive membership, and of the periodicals in its reading-room, complete this interesting publication. The Bulletin will, we believe, appear ten times per annum.

In the *Réforme Sociale* for February 15 (the fortnightly organ of the school of the late M. P. F. Le Play) M. Maurice Firmin-Didot makes a weighty arraignment of the monopoly of the Imprimerie Nationale. This establishment, whose privileges and pretensions, like its equipment, far exceed those of our Government Printing-Office, makes a nominal annual return to the state, but in reality is a heavy burden upon the budget, and is in constant conflict with ministers and departments anxious to economize their expenses by getting their printing done through the competition of private establishments. The National Printing-Office's charges are high, and are only lowered to market rates as the result of controversies which confirm the monopoly but make the lowering seem imperative. Already the Office produces the blanks of the Government telegraphs, and will assuredly contend for the printing of the railways which the Government contemplates purchasing. The article aims to show by a striking example the evil effects of Government socialism.

The London *Musical Review* of February 17 is almost entirely devoted to Wagner. There is a well-written biography of seven columns, followed by copious extracts of opinion from the principal London papers, as well as all the details that could be collected concerning Wagner's last days and the manner in which the news of his death was received in Munich, Vienna, Berlin, etc. Every admirer of Wagner should possess this paper, copies of which can be obtained at Ditson's.

In Paris an exhibition is in preparation of all the portraits, works, documents, and personal souvenirs of Jean Jacques Rousseau.

Rouquette, Paris, has published a 'Bibliographie et Iconographie des Œuvres d'Alfred de Musset.'

In Florence next month will be sold the Toscanelli fine-art collection, including some two hundred pictures on wood with gold backgrounds, specimens of the Italian and Flemish masters of the fourteenth and fifteenth centuries, about thirty of which are signed by the painters or described by Vasari; and also the remarkable Rusca collection of majolica, sculptured marbles, sixteenth-century armor, embroideries in silk and gold, bronzes and stuffs of the fifteenth and sixteenth centuries, ancient furniture, etc. Prof. G. Milanesi, who has had the arrangement and cataloguing of it, pronounces the Toscanelli collection "marvellous," and "the richest and most precious private collection in Italy"; and regrets that he was not familiar with it when preparing his last edition of Vasari. The catalogue of the Rusca collection is a work of art in itself, being beautifully printed, and freely illustrated with photographs of the several classes of objects. Both sales will be made through Giulio Sambon.

In the *Roman News* for February 14—a weekly illustrated paper in English begun last month—we find a memorial prepared by the American artists resident in Rome in behalf of a removal of the duties on works of art imported into this country. This memorial was drawn up, the *News* says, as a communication intended, with its signatures, for the *Nation*. "But before the time for mailing it had arrived, the *Century Magazine* for February was received, in which, under the 'Topics of the Time,' was printed a forcible article to the same effect, together with a resolution by the Society of American Artists that the attention of the Tariff Commission should be called to this important matter." Two sentences from this document will indicate the spirit of it : "We can think of no single good effect following from the charging of a custom-tax upon works of art. If it be supposed that thereby the interests of American artists are protected, it is a palpable mistake."

—The December number of the *Antiquary* (J. W. Bouton) contains the last of a series of papers, four in number, by J. H. Round, upon "The Domesday of Colchester." There is no better way of getting instruction from Domesday Book than the minute study of one locality, with the assistance derived from the later history and present condition of the place ; and Colchester, the Roman Camulodunum, affords a very good field for this kind of work. Perhaps the most important contribution made by Mr. Round is in the first article (June), in which, with the assistance of a map, he examines the relation of the *burgus* to the *civitas*—Colchester bearing both names, and also being classed as a *hundred* (it is well known that English boroughs regularly, or frequently, were, "for official and administrative purposes," hundreds). Mr. Round shows that the *burgus*, the walled enclosure, "formed less than a thirtieth part of the *tota civitas*," and proceeds to develop the theory that the town was "not a *walled town* with lands belonging to it, but an *urban district*, of which a small fraction was comprised within walls." It does not seem to occur to him that the *civitas*, as he defines it here, was precisely the Greek and Roman "city," and that there may have been a survival of the ancient type in this old Roman colony. The theory presented by him is, in brief, "that the old English towns were originally, in name and organization, rural and not urban, hundreds and not boroughs," and we incline to accept its general correctness, although it is not possible, in the limits of a note, to discuss his arguments in full. The other papers are of less importance, but they deserve to be studied in detail by all who are interested in the development of early English institutions.

—"We earnestly hope Mr. Parkman will continue the history of the progress of Christian civilization in Canada, and that Mme. de Clermont-Tonnerre will make it accessible to French readers." So says, in the January *Polybiblion*, a reviewer of that lady's translation, 'Les Jésuites dans l'Amérique du Nord.' The Countess had previously translated the 'Pioneers of France,' and on the ground of priority has some sort of a title to continue her reproductions. That Mr. Parkman is probably indisposed to wish for or to grant her a monopoly, or to approve her performances thus far, will be the conclusion of any one who carefully compares her latest version with the original. 'The Jesuits' has reached a fourteenth edition, and the more popular a work becomes, the more objectionable and injurious is any mutilation of it. The Countess begins by leaving out the introduction (89 pp.), which, as it relates to the native tribes among whom the Jesuits were to labor, must be considered an integral and a very important part of the narrative. She likewise, and again without any hint of it to her French readers, omits Chapters ii. ("Loyola and the Jesuits") and xiii. ("Quebec and its Tenants"). Not without some excuse, yet without proper respect for her author's arrangement, she transposes Chapter xviii. and makes it xv. Finally, the footnotes are preserved or discarded at pleasure. Probable reasons for omitting Chap. ii. may be found in the passage on p. 13: "No religious order has ever united in itself so much to be admired and so much to be detested [as the Society of Jesus]" ; and, for omitting Chapter xiii., in a number of similar stumbling-blocks to a good Catholic like the Countess; *e. g.* (p. 152), "In his eyes, the vicious imbecile who sat on the throne of France was the anointed champion of the Faith, and the cruel and ambitious priest who ruled King and nation alike was the chosen instrument of Heaven"; or (p. 158), "In 1639, deputies were covertly sent to beg relief in France, and 'to represent the hell in which the consciences of the colony were kept by the union of the temporal and spiritual authority in the same hands'" ; or (p. 160), "The unchecked sway of priests has always been the most mischievous of tyrannies; and even were they all well-meaning and sincere, it would be so still."

—Thanks to these hiatuses and to a more or less wilful perversion of parts of what is retained, Mme. de Clermont-Tonnerre succeeds in transforming Mr. Parkman into a very pious and acceptable historian for Catholics. We have not space to exhibit her method fully, but will give some examples from Chap. xiv.—"Devotees and Nuns." The simple statement, "but a remedy was at hand," becomes "Dieu allait y pourvoir," although Mr. Parkman's view of the Providence in the matter is misrepresented by such a phrase. The historian's possibly heretical but perfectly plain intimation that Madame de la Peltrie owed a higher obedience to her progenitor than to "those who held charge of her conscience" ("ses supérieurs spirituels"), is prefaced in the French by the apologetic "Notre humble opinion sera que," etc. A page or two further on, Mr. Parkman cites in a foot note the Catholic authorities who condone the sham marriage (to circumvent her father) of the pious missionary just named, and adds what his *traduttore* carefully omits: "Surprising as it may appear, the book from which the above is taken was written a few years since, in so-called English, for the instruction of the pupils in the Ursuline Convent at Quebec." By the expedient of suppressing Mr. Parkman's ironical "It is scarcely necessary to say that," he is made a believer in the miracle—"they were saved by a vow to the Virgin and St. Joseph." The following addition to the story of the chaste little girl who washed her hands that had been innocently touched by a man, is a pure and un-

warrantable insertion of Mme. de Clermont-Tonnerre's: "Mais laissons ces minuties qui, même dans leur exagération, tendaient au moins à préserver ces jeunes filles du contact de la licence sans bornes que nous avons pu constater parmi les sauvages." And so is the following in the closing paragraph of the chapter: "Le but au moins en était trop louable pour ne pas racheter ces imperfections inhérentes à la nature humaine et peut-être féminine, nous permettra-t-on d'ajouter." This sentiment has a genuine jesuitical ring, but it is none of Mr. Parkman's.

—In one of the papyri of the Turin Museum, M. Maspero has found a fragment of a debate, which he refers to the Twentieth Dynasty, the oldest known instance of that form of literary composition which flourished so much in the Middle Ages, and was not unknown in the earlier days of our own literature. It is as follows (as communicated to the Académie des Inscriptions):

"Trial of the Stomach and the Head, in which are published the pleas made before the Supreme Judges.

"While their President watched over the unveiling of falsehood, his eye did not cease to weep.

"When the required rites were accomplished for the god who detests iniquities, after the Stomach had made his complaint, the Head spoke at length:

"It is I, I, the main beam of the whole house, from whom the beams start out, and who join the beams. All the members [rest] on me, and are in joy. My forehead is joyous; my members are vigorous; the neck holds itself firm under the head; my eye sees far; the nostrils dilate and breathe the air; the ear opens and hears; the mouth emits sounds and converses; the two arms are vigorous and do so well that the man acquires respect, walks with head erect, looks the great in the face as well as the small.

. . .

"It is I who am their queen; it is I, the Head of my consorts, who will punish him who has held this language (is it not false?). Call me the Head! It is I who give life."

This is but a fragment, but it is more intelligible than many Egyptian documents. In the second sentence, one may note a facility of weeping which reminds one of the Arabian Nights, or, to go further off, of the heroes of the ancient Homeric and modern French poems. M. Maspero considers the debate to be an early Egyptian form of the fable of the Belly and the Members. If it is, Menenius Agrippa has paraded in borrowed plumes for many centuries. Now he may well say: "Pereant qui ante nos nostra dixere." It is pleasant to see how the world is growing larger in time as well as in space. Formerly, it was thought enough when Mr. Bartlett traced some familiar quotation from Talleyrand or Metternich back to Cicero or Agesilaus. As things are going now, he will soon be little thought of, and not even his eight editions will save him from being superseded, if he does not occasionally refer to books saved from the library of Assurbanipal, and find the originals of some of our American humor in the tombs of the Pharaohs.

—That Immanuel Kant, though the very embodiment of metaphysics and logic, was yet a fond reader of general literature and of works of fiction, is well known; but that he was also capable, and could be guilty, of writing verses, is a surprising fact recently made known by the *Altpreussische Monatschrift*, a journal published in the great thinker's native city, Königsberg. If it was ever before spoken of in a biography of Kant, we, at least, have either not read or have forgotten it. In a literary article on occasional productions, oratorical or poetical, to which interesting events in Königsberg life gave rise about the middle of the last century, the *Monatschrift* communicates two memorial poems by the philosopher, each consisting of a few lines only. They were composed in compliance with the then customary demand on the professors of the Königsberg University to devote to the memory of deceased colleagues some verses in Latin or German. Kant commemorated the deaths of Christiani, Professor of Law, and Lilienthal, Professor of Theology. The four lines devoted to the latter were composed shortly after the publication of the 'Critique of Pure Reason.' They are characteristic of the author, as a man and a philosopher, and not unworthy of him. Here they follow:

"Das was auf Erden folgt, deckt tiefe Finsterniss;
Was uns zu thun gebührt, des sind wir nur gewiss.
Dem kann, wie Lilienthal, kein Tod die Hoffnung rauben,
Der glaubt, um recht zu thun, recht thut, um froh zu glauben."

—Germany has lately lost two eminent philologists, both renowned as Hebraists and equally as students in other fields. We refer to Justus Olshausen, who died at the close of last year, at the age of eighty-two, and to Franz Dietrich, who died in the beginning of this year, aged seventy-two. The former, a younger brother of the well-known Protestant theologian, Hermann Olshausen, and older brother of the Holstein journalist, Theodor Olshausen—who, after the defeat of the German party in the Duchy, lived fourteen years in this country, returning to Germany in 1865—was born in Holstein, studied in Berlin and Paris, became professor at Kiel, was active with Theodor as a defender of the autonomy of Schleswig-Holstein against the Danish Government, lost his professorship in 1852, was appointed professor at the Königsberg University, and subsequently became Councillor in the Prussian Ministry of Worship and Education—a position which he held till 1874. His fame rests on his writings on the 'Vendidad' (1829) and kindred Iranian subjects, on his 'Erklärung der Psalmen' (1853)—a work of radical criticism—and on his excellent 'Lehrbuch der hebräischen Sprache' (1861). Dietrich was a native of Saxony, studied in Halle and Berlin, and from 1844 till his death was professor at the Marburg University. His activity was almost equally divided between Semitic and Teutonic philology and antiquities, his writings embracing studies on Hebrew, Chaldee, Syriac, Phœnician, Gothic, and Scandinavian topics. He repeatedly edited Gesenius's Hebrew Dictionary, the standard lexicographical authority on the language. In this editorship he was succeeded, in 1878, by Mühlau and Volck, who then issued the eighth edition, and are now publishing the ninth.

—Robert Franz, who is not only one of the greatest song writers of all times, but has done much for the cause of music by making many of the works of Bach and Handel more palatable to modern audiences, was so prostrated by a nervous disorder in 1868 that he had to give up his position as organist and director at Halle. He was saved, with his family, from penury through the generosity of Liszt, Joachim, and Frau Magnus (who made a concert tour in his behalf which netted him 90,000 marks), and the munificence of other friends. From a letter written by Franz to Mr. Sebastian B. Schlesinger, German Consul in Boston, and dated Halle, February 7, 1883, it seems that the condition of his health is poorer than ever. He says: "Day before yesterday I received your songs and was truly delighted with them. Unfortunately, I am no longer in a condition to derive material enjoyment from musical things, for my sense of hearing is *completely* gone. To this loss in the meantime has been added the paralysis of five fingers—three on the right hand and two on the left—a loss which for some time has deprived me of the power to play on the piano-forte. It is only with great pains that I am still able to take cognizance of our beautiful art through the medium of my eyes—a poor reparation, indeed, for what I have lost. But what my eyes can read redounds very much to the honor of your songs. Your melody is remote from triviality, and is agreeably supported by freely chosen harmonies which are developed in interesting forms of accompaniment. Although I can fancy a slight alteration in this or that passage, this signifies little in face of the general merits of the songs. What gave me most pleasure was the naturalness of your expression, for the want of naturalness in most compositions of the period is so great as to make one almost lose all interest in music. Endeavor to keep such monstrosities far away from you, however much the great crowd may applaud them. Art must always preserve an aristocratic dignity—at least, that is the principle I have always endeavored to follow earnestly with my own humble powers."

—Louis Sigismond complains, in the London *Musical Review*, that musical education in France is almost non-existent, music being generally looked upon as a mere recreation, and an indifference maintained toward its artistic significance, except by some hundreds of amateurs. The concerts of the Paris Conservatoire do little to advance the cause of the art or enlist public enthusiasm. Although in their sphere without a superior in the world, they are feebly directed by a man too old for that difficult duty, M. Deldevez, and address themselves to a public that is hostile in principle to all that is not Haydn, Mozart, or Beethoven, and is "more likely to hear one of Haydn's symphonies three times a year than Schumann's in B flat once in three years." At the popular concerts of Pasdeloup, Colonne, and Lamoureux a more liberal spirit prevails. Pasdeloup will always be remembered as the courageous leader who first acclimated Wagner on the Parisian concert stage, in the face of the most violent opposition. His later rivals, who have better orchestras, are now reaping the good fruit of his enterprise, and draw full houses by their programmes, on which Wagner occupies a conspicuous place. Outside of Paris, however, nothing of the kind is to be found, except at Angers, which has an admirable orchestra. "In spite of innumerable concerts and theatres; in spite of official schools, where music is taught in a more or less narrow-minded spirit, the modern progress of the art among us is far behind Germany, Belgium, and even Italy, and yet there are elements of much that is hopeful and good."

—Patriotism as a general national trait is probably as well developed in Germany as in France, but there can be no doubt that the intellectual leaders among the French are much more addicted to chauvinism than German men of genius. No greater contrast could be conceived than that, for instance, between Hugo and Michelet on the one hand, and on the other Heine, Boerne, and Schopenhauer, one of whose chief delights was to abuse their own countrymen. Richard Wagner was in this, as in some other things, a disciple of Schopenhauer; and if the French had known he had said a great many more severe things against the Germans than against themselves, they would not, probably, have abused him so much during his lifetime, and even exulted over his death. The *Revue Politique et Littéraire* of February 17 contains a hitherto unpublished letter by Wagner describing his sentiments towards the French, and containing several dabs at his own countrymen. It was addressed to M. M. G. Monod, editor of the *Revue Historique*, who had written to Wagner to express his admiration of the Nibelung performances given at Bayreuth in 1876, as well as his regrets that

the little anti-French farce which Wagner had written in January, 1871, should have made it so difficult for his music to be impartially judged in France. Wagner's reply is dated Sorrento, October 25, 1876, and contains several points of biographic interest. He explains that the farce referred to ("A Capitulation") has been misjudged. "Is there nobody who can read with care?" he asks. "Or rather, who among the journalists of the time will display sufficient intelligence and acuteness to understand that in the work for which I have been most reproached, written at the worst period of the war, in a spirit of bitter irony, the end I had in view was, above all, to ridicule the condition of the German stage? Recall to your memory the conclusion of this farce. The intendants and directors of the German theatres hasten into besieged Paris in order to carry away for their theatres all the novelties in the shape of plays and ballets." As regards his opinion of the French public, he refers to the remarks made in his account of the notorious "Tannhäuser" performances in Paris, written for a German paper and reprinted in the seventh volume of his collected works. There he attributes to this public a bright receptivity and really magnanimous sense of justice. The opposition, he could easily see, came from certain cliques, the Jockey Club and the critics, while the real public actually defended him by demonstrative applause kept up for fifteen minutes against these cliques. At the banquet given after the Bayreuth performances, he fully explained that the remarks made by him, on various occasions, against French art were not directed against that art in its proper place, as he recognized that it gave to French life and thought a precise and elegant form; it was rather directed against the servile imitation and caricature of that art by which the Germans made themselves ridiculous. This art was not adapted to German habits, and he therefore had aimed throughout his life at creating a new art of a national, German character, and typical of an original civilization. The Germans, however, seemed to prefer their mixed international art to anything new, and he found accordingly that his performances at Bayreuth "were better appreciated and judged with more intelligence by the English and the French than by the greater part of the German press." "I have," he continues, "remained further removed from the sphere which embraces the intellectual movement of contemporary Germany than from the regions where I meet serious spirits of foreign birth, so different from this so-called German culture."

A BRITISH OFFICER.

A Soldier's Life and Work in South Africa, 1872 to 1879. A Memoir of the late Colonel A. W. Durnford, Royal Engineers. Edited by his Brother, Lieut.-Colonel E. Durnford. London: Sampson Low & Co. 1882.

Colonel A. W. Durnford, the subject of this admirably-written memoir, was one of the many officers who lost their lives when the Zulus annihilated the British troops encamped at the hill of Isandhlwana. Being the senior officer present in the engagement, the responsibility of the disaster was fastened upon him by Lord Chelmsford, the General in command of the whole Army, and this explanation of the matter was tacitly acquiesced in both by the Duke of Cambridge and by the Secretary of State for War. Actually, the conduct of Colonel Durnford upon that disastrous occasion was worthy not of censure either direct or implied, but of the highest honor; and his brother, Colonel E. Durnford, feeling this, strove in every possible way to obtain a formal acknowledgment of it from the highest official authorities. His endeavors were futile. It was in vain that he produced evidence of a wholly unanswerable character. High official personages, having first closed their eyes and their minds, protested that they could "see no reason" for reopening the question; and so Colonel E. Durnford has published this memoir of his brother, in which he makes appeal to the nation against the indifference and injustice of commanders-in-chief and secretaries of state.

The interest, however, of such biographies as this is not to be measured by that of the particular incident or controversy which produced them. Their value consists in the fact that they remind us of an obvious truism, indeed, but one which we are very apt to forget, that it is not the few men who are most prominently before the world that can do much for the nation they are supposed to govern. The greatness of a people will be in a state of decadence or otherwise, according as the number is small or great of men who ask for no higher reward than consists in unstintingly devoting themselves to the duties, small or great, which are actually imposed upon them. These are the men who are most truly to be called "the salt of the earth." Wordsworth has described them in his poem on "The Happy Warrior," and such a character was the late Colonel A. W. Durnford. Among living Englishmen, there is not to be found a more striking personality than General Gordon, commonly known as "Chinese" Gordon. In him we have a man who appears to be altogether impervious to the inducements of ambition or public applause, who cares nothing for distinction or any other of the prizes on which men generally set so excessive a value; who is, in short, careful for nothing, except the consciousness of duty done. Between "Chinese" Gordon and Colonel Durnford there existed an intimate friendship, and in character also there were many striking points of similarity. The special fault charged against Durnford at Isandhlwana was that he disobeyed the orders of the General in command, and that to this disobedience the disaster was due. The charge has since then been refuted by the recovery from the field of the orders given to Durnford; but even without such clear proof, it would be hardly possible for a reader of this memoir not to feel that this charge, at any rate, could not be true. The character of the man as disclosed in these pages is a sufficient refutation.

His first military service in South Africa was in command of a small force sent in pursuit of Langalibalele and his tribe. His orders were to press on by forced marches, so as to reach a certain pass in the mountains—the Bushman's River Pass—in advance of the flying Kaffirs.

"The approach to the Giant's Castle Pass lay through the wildest, most broken country imaginable, and the difficulties of the way often seemed well-nigh insurmountable. Many of the men became exhausted and fell out, returning to camp; others might perhaps have done the like but for the example set them by Major Durnford. . . . During the day's march he met with a severe accident, being dragged backward over a precipice by the horse which he was leading up some difficult incline, and which lost its footing and fell a considerable distance, strangely enough receiving no injury from the fall. His master, however, was not so fortunate: after striking the rock several times, his fall was broken by a limb of a tree, which caught him under the left arm, dislocating the shoulder, two ribs also being injured, and his face and head severely cut. Here was an end, apparently, of all projects for reaching the Bushman's River Pass. But those who thought so, little knew the man they had to deal with. They dragged him up again, set the dislocated shoulder as well as they could manage it, and in a little while all present were electrified by the remark, in a quiet, cheerful tone, from their prostrate and injured commander, 'I'm all right now; we must push on. Elijah' (addressing the native interpreter), 'where is my horse?' 'Here it is, Inkos (*i. e.*, chief), close beside you,' was the answer. 'Then help me up'; and presently he was mounted again, and ready to proceed."

The pass, however, could not be reached that night, and when darkness fell Durnford and his party bivouacked without food or shelter on the hillside. The moon rose about eleven o'clock, and Durnford then ordered an immediate advance. But his injuries had had time to stiffen, and it was only by the stern endurance of the greatest pain that he was able to proceed.

"At first, it appears, they carried him in a blanket; but after a while it became impossible to advance any further in this manner, on account of the intense pain which this mode of progression inflicted upon his dislocated shoulder and shattered frame. . . . He got over the rest of the way on foot, by means of a blanket passed round his body, with two men holding on to either end and slowly pulling forward, while two others supported him from behind as well as they could. They were obliged to halt every two or three steps and lay him down on the ground to give him rest, yet his spirit was undaunted to the last. His first order upon reaching the mountain-top after this terrible ascent was to upsaddle the horses, but then he sank to the ground, utterly exhausted and overcome. Yet half an hour's rest was all that was necessary to restore his resolute spirit to the mastery, and, when his horses were brought up to where he lay, he made his men lift him on to his gray Basuto horse, and led the advance himself, over a rough and broken country, as energetically as if he had been in his usual state of health and strength."

The River Pass was finally reached in advance of the fugitive Kaffirs; but the attempt to stay them was defeated by reason of a panic which seized upon the Natal Carbineers (volunteers) with Durnford, who fled helter-skelter from the field, leaving their commander with a few Basuto cavalry to extricate himself as best he could.

"When at last he gave up the vain attempt to rally his white command, he turned his horse and rode back alone through the Basutos toward the pass, resolved at all events to sell his own life dearly among the foe. The Basutos at first, as one of them afterward said, 'thought he might have dropped something, and wanted to find it.' . . . But when they saw that he was riding back straight to the pass alone, they became alarmed, and some of them who had followed galloped up beside him, and although he made no reply to their questions, they knew by the expression of his face that he was going back to die. Faithful and obedient followers as they had hitherto proved themselves, they now took the law into their own hands, and, seizing his horse's bridle, they brought him back. Wounded by assegais in the arm and the side, he was by this time reduced to an almost fainting condition from loss of blood added to his previous injuries."

But the indomitable spirit of the man comes out in yet another incident of this expedition. On his return to the main body of the English force, he learned that a detachment had been sent to his support, and that, nothing having since been heard of it, it was feared that it might have been hemmed in by the enemy.

"Major Durnford, feeling these men had been sent to his support, at once declared that he would himself go to their relief. The surgeon, who had dressed his wounds, protested against his undergoing any further fatigue; but those sent to his assistance were in danger, and no one but himself was competent to lead a party in search of them. Remonstrances were of no avail. He called for volunteers. . . . A thunderstorm, accompanied by heavy rain, coming on in the afternoon, prevented the march of the party until 11 P.M. It was a memorable scene, not easily to be forgotten by those present—and there were many—who appreciated the devoted conduct of the leader of the relief. Among the soldiers of the regular force, this appreciation rose to enthusiasm when, unable to mount by himself, Major Durnford was lifted upon his horse and took his place at the head of the detachment."

At the beginning of his South African career, Col. Durnford had accepted without question the ordinary British view of British dealings with what are called "inferior races"—namely, that the "inferior races" are always in the wrong, in consequence of an inborn depravity of character, and the English always in the right, in virtue of their higher civilization. The "eating up" of Langalibalele and his tribe—an act shocking even when judged by the standard of South African precedent—convinced Colonel Durnford that the popular view was not consistent with facts, and from that time he stood forth as the fearless champion of the Kaffir races against European tyranny. He became among the settlers the most unpopular and best abused man in Natal; but by the Kaffirs he was rewarded with the heartiest loyalty and gratitude. "He was," said one of his Basuto soldiers, "a new experience to us. No other white chief ever showed us the same consideration and sympathy. That night on the mountains [in pursuit of Langalibalele] it was cold, but the Major could not bear the weight of his heavy waterproof-coat on his injured shoulder. So he told Elijah Kambula, who had on a light woollen overcoat, to change coats with him. Elijah, who had never received such an order from a white chief before, said to me in Basuto, 'What did he say? That I am to give him my coat and wear his?' 'Come, Elijah, make haste!' exclaimed the Major; 'are you afraid to lend me your coat?' Then Elijah gave it to him, but he had to be told again before he could venture to put on the other. And we all said among ourselves: 'What sort of a chief is this that we have found? He does not despise us!'"

As regards the battle of Isandhlwana, Durnford's share in that disastrous engagement consisted in this, that on the morning of that battle he conducted a cavalry reconnoissance which discovered, at a distance of some five miles from the British camp, a Zulu army, twenty thousand strong, bearing down in a huge semicircle upon the unsuspecting British troops. Though he had with him only two hundred and fifty Basuto horse, he managed these with such admirable skill that not only was the camp warned of its danger, but the Zulus had lost upward of a thousand men before they reached the hill of Isandhlwana. Durnford, in fact, held them completely in check until his ammunition was expended. When the battle was lost, and soldiers and camp followers, crowded together, were flying toward the Natal frontier, Durnford saw that the retreat might be covered, and pursuit checked, if a narrow "nek" were held. Rallying a few of the Twenty-fourth Infantry, and assisted by fourteen of the Natal Carbineers under Lieut. Scott, he held this "nek" for more than two hours until the last man of the little band had fallen where he stood. This heroic stand made a profound impression upon the Zulus. The resistance of "the lion," as the Zulus termed Colonel Durnford, was, they said, so nearly successful that they gained the victory only by their overwhelming numbers, and looked upon it as virtually a defeat. Two months elapsed before the field of Isandhlwana was revisited by British soldiers, and then, for the first time, the incidents of the battle were revealed. One of the Colonel's Basutos, who had escaped from the battle, tells the story of the finding of the body in a very touching way:

"Captain Shepstone and I had been looking a long time before we found him. All the rest were getting wagons and caring nothing, and I was a long way off when I heard Captain Shepstone shouting and saw him waving his arm to me to come. And when I came, he said: 'Look, Jabez, whose face is this?' And I cried out, for it was he; and I saw my master's face again—just himself, changed but very little. No one could doubt for a moment. I cut down a wagon-sail with my knife—for we had not even our blankets with us—and I wrapped my chief in it, and I took him up in my arms (it was these hands that tended him) and I carried him gently to the hollow where we laid him."

In the battle itself, these gallant soldiers had been separated from their much-loved chief in the overwhelming rush of the Zulus. But, speaking of the cavalry reconnoissance, this same Jabez says:

"We could have carried him off with us safely enough at this time, only we knew him too well to try. But we now say, 'If we had known what would happen, we would have seized him and bound him, no matter if he had fought us for doing so, as he certainly would—no matter if he had killed some of us, we would have saved his life, for he was our master.' Now we say that we shall always remember him by his commanding voice, and the way in which he gave us all some of his own spirit, as he went along our line that day; and those among us who had not served under him before, as I had, say, 'Why did we not know him sooner?'"

Never, Jabez goes on to say, in all the years that he had served under the Colonel, had he seen him look so bright and happy—never seen his face shine and his eyes brighten—as during that last fight, when he knew for certain that he should die.

THE CHURCH OF ST. MARK'S.

La Basilica di San Marco in Venezia, Illustrata nei riguardi dell' Arte e della Storia, da Scrittori Veneziani. [The Church of St. Mark at Venice, illustrated from the points of view of Art and History by Venetian Writers.] Parts 1–4. Eight plates in folio; ninety-six plates in quarto, five index plates, dedication, and preface. Venice: Ferdinando Ongania. 1881.

THE Italian publishers have, in illustration of their national monuments of art, begun in earnest the publication of great and costly books, comparable for thoroughness with the productions of Germany, and for brilliant excellence with those of Paris. To those persons who have expressed surprise that united Italy should have appeared solely industrial and military in her undertakings, this at least is to be said: that she is not so unaware of her exceptional position as a custodian of art-treasures as has been supposed. Italian support to these private undertakings of the booksellers may come slowly; but it is good to see the publishers, even if leaning partly on foreign aid and looking forward to native help later on, at least risking something to vie with the older nations of Europe in great undertakings of this sort. At the same time, the work whose title is given above is not to be taken as a perfect type of a class; it is too extensive, and its pretensions are too lofty, for other works to be compared with it hastily. It is the subject of the present inquiry how far it maintains its high pretensions.

The Church of St. Mark is a subject which might well seem too vast for any compiler however diligent, or any publisher however enterprising. Its ornamental details are incalculably numerous, and all are valuable. The richest sculpture, Christian Greek, Italian pre-Gothic and Italian Gothic, the most elaborate and delicate inlay and incrustation in precious marbles, porphyry, serpentine, alabaster, and glass, and of all epochs from the tenth to the seventeenth century, the freest use of large masses of precious material in shafts and wall-facings of literally priceless value (priceless because not to be matched or estimated in any market now open), the most general use of mosaics for interior decoration—all these elements are combined to produce a result of such beauty and variety of charm that no ordinary means can hope to render it even to the most careful student, even with that amount of shortcoming which one expects and allows for in such a reproduction. We are driven, therefore, to some analysis of the prospectus of this work, as well as to an account of what has appeared already; for, while the four parts before us are sufficiently full and varied to make possible some criticism of what is done, there are six parts still to appear, and the newly-received prospectus lies before us as a synopsis of the work's whole plan.

Forty years ago two artists, named John and Louis Kreutz, began the publication of a great work illustrative of St. Mark's. Six very large folio plates, and about one hundred of quarto size, were issued, giving a great mass of details on a large scale, chiefly of the mosaics and of the tesselated pavement, together with some beginnings of a general résumé of the whole pavement, a large plan for reference, and two general sections showing in outline all the mosaics coming within their scope. These plates were all engraved, probably on stone, chiefly in outline, and hand-coloring was used for the details of the pavement; these two, indeed, being the only vehicles within the authors' reach. This work remained unfinished—in fact, hardly well begun—and it is now out of print. It appears that the publisher of the new and more elaborate book includes in his design a reissue of the Kreutz plates, as of proved accuracy, and satisfactory as far as they go. The system of reference to the details, by means of a large plan inscribed with the subjects of mosaics, etc., each in its proper place, has been adopted by the present publisher, and carried further by means of reference-diagrams of elevations and sections of the building. The pavement of the church, well known to all travellers, and famous in the history of art, will be published *complete* in one enormous plan, occupying seven sheets of the folio size (paper, 22½ by 28 inches), which can be put together and mounted as a complete plan of the floor, and which shows every little pattern in every part of this always varying design—even, we are assured, every little triangle of marble in its proper place. One of these seven sheets belonged to the Kreutz publication; the drawings from which the new plates are reduced by photographic process are the result of four years' constant work, and are now on public exhibition at Venice, together with others of the preparations for this work, in rooms above the publisher's shop. The quarto plates of detail have indications of the color, put on by hand, upon the black outline. It is to be regretted that chromolithography is not put to use in this case. Never was a fitter occasion for it, and a half-dozen large details in careful facsimile in chromolithography would give to most persons a better idea of the wonderful effect of the pavement to him who walks over it, than many more plates printed in black and hand-colored in part. There are promised one or more large plates, in color, of the marbles and other stones used in the building, presumably classified mineralogically. But we hope that for this unequalled floor will be allowed not only the exhaustive analysis of the uncolored general drawings with the detailed plates we have spoken of, but also some more adequate representation, such as the brothers Kreutz could not give, but which has now been made possible by chromolithography.

The mosaics of the domes and vaults offer a problem far more difficult to solve. They are very nearly all on curved surfaces. Photography renders them well where light can be had, but misses the color. Artistic drawings in colors are best where their accuracy can be trusted. Measured or traced outline is out of the question for the domes, because not to be transferred to flat surfaces, except for small, separate details. The plan followed by Kreutz

was to give outline details in separate small plates, sometimes partly colored by hand, and to refer these to the large sections of the building. Mr. Ongania follows the same plan for the details, but will supplement it by permanent photographs of all that can be got at by the camera, and also by twenty-nine chromolithographic reproductions of water-color drawings. These will be of folio size, some "picturesque views," and some measured reductions of flat surfaces and developments of the cylindrical surfaces of vaults. Only two of these last, however, have yet been issued. The hand-colored outlines are large in scale and satisfactory in their way, and are already very numerous.

The façade on St. Mark's Place has been the subject of especial study, and of the plates devoted to this a number have already appeared. The whole front will be given in chromolithographs on an enormous scale (about two feet to an inch), occupying twenty-one folio plates, and making, if put together, a general colored elevation 5 feet 9 inches by 8 feet 9 inches. We have already the central doorway and two of the four minor doorways. It is always difficult, whether in the drawings themselves or in these mechanical reproductions of them, to fix the precise limit of elaboration in detail. It is necessary to correct the technical word "elevation" used above: the drawings have all been made with just so much perspective as a photograph gives when taken exactly in front and from a considerable distance. We have, therefore, in order to test the amount of detail given and the stress laid upon it, compared carefully the chromolithograph of the central door with the immense photograph made by Mr. Naya, a little larger in scale and made from precisely the same point of view. The result of a minute comparison is satisfactory. The happy medium seems to be very nearly attained of detail so given as to affect the general design nearly as in viewing the building itself. We have, indeed, detected at least one place in which the photograph reveals a small figure where the drawing shows vague scroll-work, but it is in the flat bas-relief of the archivolt, and much in shadow. In like manner, the photograph gives some of that loveliness of line and mass which a close examination of these sculptures shows so fully; and we cannot say that the chromolithograph does that for us. On the other hand, we are inclined to approve without reserve the color of the three drawings already received. The natural color of the veined and mottled marble, the red, green, and brown columns and wall-facings, contrasted with the color that white marble has gained from weather and salt air—all this, with the chromolithograph in hand, and with clear memory of Mr. Ruskin's glowing and brilliant drawings, seems as nearly satisfactory as possible. One might say, indeed, that these drawings of M. Prosdocimi are rather an architect's than a professed colorist's; rather explanatory of the general and somewhat distant effect than an interpretation of each separate mass of color; too cold to satisfy one who has filled his mind with the wonderful effect of these porches—any such prints will come short in this way—but, on the whole, they are very like the church as it rises from the square, two hundred feet from you.

We come now to a part of the work to which praise only, and that very warm, can be applied. The prospectus enumerates three hundred and ninety-one plates of details of the interior and exterior. We take these to be all photographic, for the thirty-one plates already received of this category are all in heliotype. Certainly nothing could be more successful than these capitals, bas-reliefs, parapets, delicate sculptures of all sorts and of all epochs, some taken in the full light of the exterior, and some (obviously by means of artificial light) in the dim semi-darkness within. Four hundred of these are already a little capital to begin with in the study of decorative art.

This *compte rendu* tends to grow long, and we must come promptly to the chronological part of the work. Material exists for a more or less complete history of the building, and important additions have been made to this material, recently, in the course of the repairs now going on. In the four numbers already received is a folio chromolithographic plate of the west front as it is shown in Gentile Bellini's great painting ("The Procession on the Piazza of St. Mark") in the Academy of Fine Arts of Venice, in which the mosaics are given as they were in 1496. We have also two plates of a series which will show the brick basilica of the eleventh century before the marble facings and screen of columns were added, which turned a Byzantino-Italian church of a not wholly unusual type into something wholly unique in architecture, the most purely beautiful church in the world. These two plates, which have been published, on a reduced scale, before, are the result of measurements made during the repairs and restorations of 1846–9. During the recent partial repairs of the front, and too radical restoration of the south flank, new discoveries have been made of the greatest value in the history of architecture. Descriptions of these newly-discovered features of the early brick basilica, which lies hid beneath the sumptuous exterior we now see, cannot be given here; but the drawings prepared for reproduction in this work are of extraordinary interest.

Of the text, no part has yet come to hand. The names of the authors are announced, and are of reputable Venetian antiquarians. Mr. Camillo Boito, of Rome, a man well known as a writer on art subjects, and connected with Government commissions for the conservation of historical monuments, is named as the general director. It is not advisable to give at present the names of the different artists and authors employed upon the work, as each one's part in it is not yet very clearly established.

This article must not close without some allusion to the borders, vignettes, titles, etc. We cannot like the elaborate dedication, where rich initial-letters and borders, taken from manuscripts of the fifteenth century, are used in an arrangement too like the modern compositor's title-page. The preface-page is better, in a quaint letter sufficiently recalling the monkish character, and yet legible, and with more of the big illuminated initials. The borders and heads of pages, taken from details of the building, are all good, quiet, suitable, truly decorative to the work; and even the portfolios are of uncommon solidity, as if meant to last, and of tasteful get-up. This bids fair to be one of the most important works on decorative art ever published, as well as an unsurpassed and perhaps unequalled monograph of a great ancient building. As regards the things not promised in the prospectus, and which we have alluded to as desirable, it must be said that several times already the plan of the work has been added to since its inception. New discoveries in the structure itself, and ancient representations of the church in newly-studied manuscripts, have been adopted as novel features in the work, and therefore it is to be expected that completeness will continue to be sought for, and nothing will be left undone to make the publication an exhaustive and final monograph.

Leading Men of Japan. By Charles Lanman. Boston: D. Lothrop & Co. Pp. 421.

We can imagine few more fascinating subjects of inquiry in the field of biography than the story of the leaders of the revolutions in Japan, which culminated in 1868. That wondrous change in the temper and policy of a long-secluded nation showed only its outer side to the world. Hence, most alien lookers-on imagine that the transformation was purely the result of forces applied *ab extra*—the presence of foreigners and the civilization of the West. This, however, is but half the truth, and what lay upon the other hemisphere of this political moon the average gazer saw not. In fact, the revolution of 1868, which abolished the duarchy of Mikado and Shō-gun, and swept away the feudal system and most of the characteristic features of the Japan known to foreigners since the sixteenth century, began a hundred years or more ago. The renaissance of critical historical investigation by the Japanese scholars of the eighteenth century upheaved the foundation on which feudal Japan—the only Japan known or understood by Europe—rested. Commodore Perry did in reality but approach a volcano. Literary, political, and religious forces were at work at the core, and coming to vent with a rapidity frightful to Tycoons and their followers as early as 1853. Perry's presence was like a lump of foreign matter thrust into a geyser, hastening results which, however, were inevitable later on. Of the men by whose genius and action the crisis was precipitated and carried to triumphant conclusion, many had never seen a foreigner, and perhaps most of them were arrayed in fanatical hostility to them before the cannon at Fushimi opened civil war and proclaimed the downfall of dualism and feudalism. The leaders of New Japan were obscure men, yet full of the "fire shut up in their bones" which the study of the past and a reverence for the throne and person of the Mikado, amounting almost to fanaticism, bred within them. Yet these men at once ratified the treaties, and with unquailing courage and perseverance, spite of the blind hatred of the alien within their own ranks, adopted one after another the foreigner's forces and methods. Their object was to sweep Japan free of outsiders, by adopting their own weapons. Finding this impossible, they attempted the double task of the civilization of Japan in the spirit of the nineteenth century and Europe, and the renovation of their entire political and social system. Against fearful odds, they were called to confront a host of new and unexpected problems. Children in political experience, they expected to compass the results of ages, not in "a cycle of Cathay," but in less than "fifty years" of Europe's time. It is needless to add that they are now sadder, wiser, and a few of them less earnest men than they were fifteen years ago. Some with dogged, a few with frantic obstinacy are striving to cool the volcano they helped to open.

A splendid task awaits the writer who will delve beneath the surface and reveal the training of the individuals and the accidents of history by which the marvellous results were wrought; results which, notwithstanding their brilliancy, make the spectator dizzy. Around Japan lie abysses from which her ablest financiers, her bravest soldiers, her wisest and calmest statesmen, are, or will soon be, called to save her. For the solution of the questions herein suggested, the best part of Mr. Lanman's book is the title. The work is conscientiously accurate so far as it goes, which is but a short distance. The fifty-nine notices of the living and dead men of Japan range from half-page notices to twenty-one or more pages of but slightly reworked or untouched newspaper material. In an appendix are seven papers, nearly all reprints, relating to the Empire and its outlying portions. The book

is worth a place in libraries because there is as yet nothing better to take its place; but its bald and scrappy style is repulsive. Taken as a whole, it is a bundle of pamphlets, creditable neither to publisher nor to author.

The Shenandoah Valley in 1864. By George E. Pond, Associate Editor *Army and Navy Journal*. [Campaigns of the Civil War—XI.] Chas. Scribner's Sons.

THIS book deals with one of the most exciting and interesting of the subordinate campaigns of the war. It is written with unusual clearness; the arrangement is lucid, the style good, the description simple and straightforward. The book is as interesting as a novel. The maps are better than in many of the series. From an historical standpoint, however, the merits of Mr. Pond's book are more doubtful. There is nothing intemperate in it, and the author has evidently aimed at fairness. He is probably unconscious that his field of view is so filled with the deeds of the Federal army and its leaders as to leave space for only a distant, imperfect, and sometimes incorrect view of the Confederates. His defence of General Sheridan's military operations is especially elaborate, his eulogies of that officer ample and earnest.

In the spring of 1864 the first operations in the Shenandoah Valley and in Southwest Virginia were conducted by Sigel. This officer advanced from Winchester early in May, but was defeated at Newmarket by Breckinridge on May 15. He was promptly displaced and Hunter appointed in his stead. Having ordered Crook and Averill from the Kanawha to meet him with their 10,000 men at Staunton, Hunter started for the same point, May 26, with 8,500 men. Breckinridge, after the defeat of Sigel, had been withdrawn with the best part of his forces to reinforce Lee's thin lines at Richmond, and the defence of the Valley had been left by the Confederates to W. E. Jones and a mixed force of some 5,000 or 6,000 men. This force was badly defeated by Hunter, not far from Staunton, on June 5. There was nothing now to oppose Hunter's progress, who, with 18,000 men (after the junction of Crook's forces), moved forward from Staunton, through Lexington, toward Lynchburg. Sheridan was sent out by Grant to make his way with his cavalry through Gordonsville and Charlottesville toward the same point. Though Lee was hard pressed for men, it was absolutely necessary to block this movement in his rear and against his depots. Breckinridge was ordered back to check Hunter, and Hampton was sent to stop Sheridan. A few days later (June 13) Early was sent after Breckinridge with instructions to defeat Hunter if possible.

Early marched eighty miles to Charlottesville in four days; found that Sheridan had been driven back, but that Hunter was then approaching Lynchburg, where Breckinridge, with an entirely insufficient force, was confronting him; moved by rail and road sixty miles in the next two days to this latter point, and reached it in time to beat Hunter off. Early's entire force was inferior to Hunter's, but the latter was far from his base and in a hostile territory, and he therefore retreated toward Salem and thence to the Kanawha. Early followed vigorously until he found that Hunter had left the Valley and entered the Alleghany Mountains.

Lee, obliged to detach troops to look after Hunter, had instructed Early, after disposing of the latter, to cross the Potomac and demonstrate against Washington. This strategy, in preceding campaigns, had proved an effective means of dividing the Federal forces and causing the recall of large bodies to defend Washington. Early now turned to the execution of this design. He had already moved his army 200 miles in nine days. Resting one day at Salem, he, with 15,000 men, set out for the Potomac, 212 miles distant. He started on June 23 and reached Harper's Ferry on July 4. Here some days were spent in obtaining supplies, and in an attempt to manœuvre the Federal troops away from Harper's Ferry. On the 8th, leaving the Federal garrison behind him, Early marched on Frederick. Next day he defeated Wallace and part of the 6th Corps which Grant had sent to meet him. On the 10th he advanced rapidly on Washington, and by noon of the 11th the advance of his footsore and weary column reached the Federal lines near the city. These lines were manned by the garrison of Washington; and the troops of the 6th and 19th Corps, which had been hurried from Richmond and the South to meet Early, were at hand. Hunter's army, having made its way to Parkersburg and thence by railroad to Harper's Ferry, was gathering in his rear. Early could not enter Washington. He had achieved his object in creating a panic, drawing troops from Grant, and in protecting Northern Virginia during the harvest. Leaving Washington on the night of July 12, he slipped between the two armies which were gathering in front and rear, and safely recrossed the Potomac. Few operations of the war were managed with more audacity and skill than this northward movement of Early's.

Early now for more than two months maintained his hold on the lower Valley, constantly breaking up the Baltimore and Ohio Railroad and the Canal, and making or threatening incursions north of the Potomac. When he had been pushed back to Strasburg and Grant began to withdraw the troops sent up to defend Washington, Early turned upon Crook, defeated and drove him across the Potomac (July 24). All withdrawal of Federal troops from the Valley then ceased, and additional forces were sent there. Grant now placed Sheridan in command (August 6) and augmented his forces to 56,000 men. Early's were raised (according to Mr. Pond) to 21,000, but were reduced to 17,000 by the recall of Kershaw's division. With this force Early held Sheridan completely in check from August 7 to September 19 and maintained his threatening attitude in the lower Valley.

The fortunes of war now changed. Under the inspiration of a visit from Grant, Sheridan decided to attack. Kershaw's division had set out to return to Richmond. Early's success had made him too bold. He had for weeks invited the attack of an army three times as strong as his own in the open country about Winchester. On September 19 this attack was made, and after a long and bloody day's fight the Confederates were defeated and driven from the field. Early halted twenty miles in the rear, at Fisher's Hill, where Sheridan again badly defeated him three days later. The Confederate general now retreated to the upper Valley, followed by Sheridan, who advanced to Staunton and began to lay waste the country. He supposed the Confederates finally disposed of; but Early harassed his opponent in every way in his power, and by the incessant activity of detached cavalry and of such partisan commands as Mosby's, rendered the Federal communications with the Potomac so perilous and uncertain that Sheridan, early in October, returned to Cedar Creek. Early, reinforced by Kershaw, followed, and to prevent troops being sent to Grant, determined to attack Sheridan's victorious and greatly more numerous army. This he did on October 19, when, by surprising the Federal camp, he completely overwhelmed the 8th and 19th Corps, and drove back the 6th. Then it was that Sheridan performed the most brilliant feat of his life. He was at Winchester when Early fell upon and routed his sleeping forces. Reaching the battle-field in the midst of the dismay and rout, he rallied his flying troops, reformed them on the veteran troops of the 6th Corps, which had not been broken, called his splendid body of cavalry to his assistance, and, attacking Early in turn, overthrew him, and converted one of the most remarkable of Confederate victories into a most thorough defeat.

Mr. Pond states fully and clearly the orders under which Sheridan devastated the Shenandoah Valley by a wholesale destruction of private property. He is not so careful as to Early's order which led to the burning of Chambersburg, and the attending circumstances. The applicability of the *lex talionis* is in most cases a matter of dispute, and the historian should be careful to make a full and fair statement of the facts. In this instance, as in some others, Mr. Pond's narrative is neither full nor accurate.

The Jesuits: A Complete History of their Open and Secret Proceedings, from the Formation of the Order to the Present Time. Told to the German People by Theodor Griesinger. 2 vols. G. P. Putnam's Sons. 1883.

IT is difficult to speak judicially of a book which is itself wanting in every judicial quality. As the title suggests, this is intended to be a popular work; but it is popularity in the lowest and worst form which is here aimed at. It is an unenviable popularity which comes from an appeal only to the least critical and least exacting sort of readers, and that is the only kind of popularity this book can aspire to. It has, however, the merit of sincerity. The author is convinced that the Jesuit order is one of the vilest works of the source of all evil, and every sentence is inspired by that conviction. His book is not a history: it is an indictment, of which each chapter contains a count. His method is not that of the historian who examines carefully his material, prepared to find himself in the wrong, but rather that of a prosecuting attorney seeking everywhere for arguments to prove his accusation. As to his sources of information, we have no account whatever, excepting that here and there a foot-note shows that he at least knows the names of some original materials.

This alone would prove that we have here nothing that can be of service to the world of scholars. A mass of scandalous stories, raked together from every quarter, and told with a malicious satisfaction as far as possible removed from the fitting calmness of historical narration, are little calculated to serve any serious purpose. Indeed, a glance at the brief record of the author's life and work would not justify high expectations. A revolutionist of 1848, tossed about for a time in America, and finally returning to his native Würtemberg, Griesinger's life-work has been the presentation of the darker side of social and political movements. His earlier works, 'Mysteries of the Vatican,' 'Mysteries of New York,' 'Woman's Government in European Courts,' have attained a wide popularity at home, and have passed through several editions. Their titles show the bent of the author's mind. His scent is keen for whatever will excite the imagination and serve to rouse the passion of his readers in his own cause.

The present work worthily continues this unsavory succession. An abusive and violent tone pervades the very headings of the chapters. The divisions of the subject sound like the titles of the acts in a sensational drama. The whole account of Loyola, occupying the first book, is absurdly one-sided and inadequate. The heroic side of the man, the real grandeur of his purpose, his relation to his times, the peculiar character of his plans, as adapted to a new and

peculiar need of the Church—all this completely escapes the author's vision. The whole later history of Jesuitism—a dark and sad history enough at the best—is made to throw its shadow backward over the character and purpose of its founders. These men, moved by impulses foreign to our day and civilization, must be judged by the standards of their own day if we would truly understand their place in the world's progress. The inability to grasp and apply these standards completely disqualifies any man from assuming the name of historian. He must become, then, a mere teller of stories, and cannot fail to add his part to the already too great mass of the world's misunderstanding and prejudice.

The Jesuit order has a frightful account to settle. The indictment, as we read it here, seems unanswerable, and we believe it to be so. The Roman Church can never again claim the respect of mankind unless it cuts this sore relentlessly from its body. With all its exaggeration and carelessness and evil spirit, we are forced at last to the confession that we believe there remains a great residue of truth in this book which may go far toward justifying its existence. There are persons—a vast majority in the world—who are led and influenced only by such work and words as these. It is unfortunate that these persons, swayed as they are by passion and prejudice, should be appealed to, but it may be answered that if the truth does not seek them out, falsehood will, and so the feeling with which we started on the perusal of these pages, of repugnance and disgust, changes partly into a hope that it may reach its true audience, and do good. The danger is that, while it calls attention to the past horrors of the Jesuits, it may fail to warn against the wider and subtler dangers of Jesuitism under all names and forms. A study of this subject in its true historical relations is one worth the best labor of a powerful mind. It is pitiable to see it thus belittled and degraded in the hands of a vulgar demagogue.

If one has to search for a justification of this book in the original, it becomes still more difficult to understand why it should have been selected for translation. At all events, if this were to be done, it behooved the publishers to put the work of translation into, or to receive it only from, capable hands. It might have been possible to improve the style in a new language, but the present version only aggravates every fault of the original. One does not need to see a copy of the German book to know its wording, for the language of the translation is almost as much German as English. Extracts would be of little use where the whole style is a mass of grammatical absurdities. Such English was never spoken or conceived of by any mortal excepting such as belong to the unfortunate race of professional translators. The absurd style of these volumes will probably have its own effect in repelling all readers to whom a good style is an attraction, and a vicious style an unpardonable offence.

Goethe-Jahrbuch. Herausgegeben von Ludwig Geiger. Dritter Band. Frankfort, 1882.

THE third volume of the *Goethe-Jahrbuch* was designed to be a commemorative work, and to appear on the fiftieth anniversary of the poet's death. The editor, Prof. Geiger, wished to make it exhibit the influence of Goethe upon European thought in the half-century following. This design was abandoned, from the conviction that the range of such an investigation would exceed the limits of a single volume. The *Jahrbuch* has constantly increased in value, and has become indispensable to all who would be familiar with current investigation in Goethe literature. Each volume contains discussions and researches, newly-discovered works—mainly early texts and letters—and brief contributions, often of great value, to the history of separate writings and periods in the life of the poet.

The article by Brandl in the present number, upon the reception of Goethe's youthful works in England, is really a contribution to English literary history. The general ignorance of German literature in England a hundred years ago was astonishing. The first knowledge of the German drama was obtained at second hand from bad French translations. The state of political opinion was such as to prevent an early acquaintance with German authors, and to this result the character of the literature itself contributed. The stormy nature of these works made them seem either allies or causes of the revolutionary era in France, which was so dreaded in England. Anti-Jacobin papers were founded to oppose all novelties in politics and religion, and to ridicule the foreign dramas which embodied the new tendencies. Goethe was considered a representative of this spirit—a *Stürmer* and *Dränger*—long after his most mature works had been published. The appearance of his autobiography in 1811, and the writings of Madame de Staël and the Schlegels, first revealed the value of the new literature arising in Germany. The interest in German studies in Scotland, and the influence of Goethe upon Walter Scott, are shown in a satisfactory manner. "Goetz von Berlichingen," which Scott translated with more fire than fidelity, stimulated his interest in the tales of the Border. His translation exhibits some curious mistakes. He trusted too much to the likeness of words in Scotch and German as a guide to their meaning. He struck out passages that savored of anti-royalty, or that might offend aristocratic notions. The women become ladies, and, instead of serving in the commendable fashion of German matrons, issue orders to their subordinates. The influence of "Goetz" is clearly shown in "Marmion" and the "House of Aspen" (which, though one of Scott's earliest dramas, was not published until 1829), and, perhaps, in the storm scene in 'Ivanhoe.' The author asserts too confidently a likeness between this early drama of Goethe and the "Lay of the Last Minstrel." It is unquestionably true that "Goetz" led the way in the long series of dramas of chivalry—*Ritterdramen*—but the *motives* and machinery in all are similar: the secret tribunal, prison, ordeals, and sieges of cities appear in them all. Even the names of the characters are often the same. *Brother Martin* appears as the friar, and *Adelheid* as the heroine. Brahm has shown in his 'Deutsche Ritterdrama' that in a list of fifty dramas the secret tribunal (*Vehme*) appears ten times, the prison seventy-four, the siege of castles nineteen, and trial by ordeal eleven times. Scott read widely and translated many of these plays, and only a general resemblance can be traced between his poems and dramas of chivalry and those which were popular in Germany.

The attacks of the Anti-Jacobins put a stop for a time to the study of German literature in England, which was resumed when the new alliance of the two nations against Napoleon awakened a fresh interest in foreign studies. The effect of Goethe's writings upon Byron, Coleridge, Shelley, and Hazlitt is scarcely indicated. To Carlyle we are indebted for the new era of German study in England. Several errors in names appear in this article. The author of 'Fust von Stromberg' was Jakob Maier, and Scott's friend who translated Schiller's "Robbers" was Alexander Fraser Tytler, afterward Lord Woodhouselee.

Urlich's article on "Goethe and the Antique" is an interesting survey of Goethe's art studies in Italy. It exhibits the failure of his efforts to attain technical skill in art, as well as the stimulating influence of his views upon the artists with whom he came in contact. The dependence which a theorist in art is wont to feel upon a practical worker, even upon one of subordinate merit, is shown by his extraordinarily favorable judgment of Meyer, who resided so long in his house: "Meyer has advanced beyond Winckelmann, and carried a knowledge of art to a crowning-point. His history of art is an immortal work."

Erich Schmidt, who contributed a study of Lessing's "Faust" to the second volume, writes upon "Faust and the Sixteenth Century." The germs of "Faust" are found in the intellectual conflicts of this period, in the struggles and superstitions of the old faith, in the humanism and culture of the Renaissance and the aspiring spirit developed by the Reformation. Two sources of the Faust-book have been found in two works separated by a thousand years—namely, in the 'Confessions' of Augustine and in Luther's 'Table-Talk.' The former has been pointed out by Hermann Grimm in the *Preussische Jahrbücher*, and the latter briefly by Schmidt in the present article. Many of the anecdotes related by Luther in his famous 'Tischreden' were undoubtedly used by the author of the original Faust-book.

Scherer makes an elaborate effort to show that Goethe was a consummate artist in the arrangement or grouping of his writings in different editions of his works—always proceeding upon a given theory and advancing from the near to the remote, from the known to the mysterious. The poems which stand first in the collected edition of his works are confessions of his life, as the introductory poem says; 'Wilhelm Meister,' which follows, is likewise a confession: the poet is represented in his æsthetic strivings taught by practical life as was Goethe by his administrative duties and study of physical science. His dramatic theories are corrected by experience with the theatre. Goethe's contributions to the theatre naturally follow. Beginning with his early dramas, which contain most of his own life, the summit is reached in "Faust" and in the works of artistic content contained in the same volume, where the striving spirit is represented as scholar, artist, and humanist. This ingenious theory is suggestive, and meets with confirmation at many points, but breaks down unexpectedly from the difficulty of assigning adequate reasons for the place of certain writings, which is not uniform in different editions. The author believes that the arrangement of the poems may be studied and found equally instructive. He designs to subject them to a similar analysis, holding that, joined to the chief aim in any work of art, are numerous subordinate and unintentional beauties.

The brief contributions to the history and interpretation of single works of Goethe (*Miscellen*) are numerous and valuable. Jacoby shows the influence of "Faust" upon the metres and certain scenes in the "Jungfrau von Orleans." Von Loeper contributes an interesting note showing that the scene in Auerbach's cellar, in "Faust," was borrowed from a lost version of the Faust-legend. In the middle of the eighteenth century—possibly at the very time that Goethe was a student at Leipzig—the play of "Faust" was performed in a booth before the Peter's Gate. In this play a celebrated Italian cellar under Auerbach's court was represented, from which Faust was said to have ridden forth on a wine-cask.

The *Mittheilungen* contain a considerable addition to the already large existing Goethe correspondence. The letters to Meyer and the

Chancellor von Müller are full of personal details regarding Goethe's life. A valuable series of letters to and from Klinger and the Princess Galitzin reveals the welcome fact that Goethe's heirs have decided to give to the public some of the treasures which have been so strictly guarded in the poet's house, from which further contributions are promised. The Bibliography contains notices of the various books and separate articles upon Goethe which have recently appeared in the different languages of Europe, often with a résumé of their contents. Finally, this number contains an exhaustive index to the previous volumes. An excellent engraving of the drawing of Goethe, made in the last year of his life by Schwerdgebunt, forms the frontispiece.

The Woods and Timbers of North Carolina. By P. M. Hale. Raleigh: E. J. Hale & Son. 1883.

EVERYTHING relating to the forests of the country is now of general interest, and the public will be indebted to Mr. Hale for republishing in convenient form, from the 'Geological and Natural History Survey of North Carolina,' Mr. Curtis's excellent account of the trees of that State. Although twenty years old, and long out of print, it loses none of its popular and scientific value. No other State has yet published such an accurate, compact, and valuable account of its woody plants. In the same volume is collected much fresh information in regard to the actual condition of the forests in the different counties of the State, which has been gathered for the purpose by local observers; besides information in regard to population, railroads, and farms, here conveniently condensed from Census publications.

North Carolina has reason to be proud of her forests. They are hardly surpassed in value, beauty, and variety by those of any locality of equal extent. The palmetto, the great evergreen magnolia, and the Southern pine flourish upon her coast, while upon her mountains our Northern pines, hemlocks, and birches grow side by side with magnolias and other Southern trees. Nowhere do the oaks, hickories, and walnuts attain finer proportions than upon these mountains, while many trees, like the wild cherry, the tulip, the chestnut, the laurel, and the rhododendron reach here their greatest size and beauty.

Diligent botanical travellers and enthusiastic lovers of nature long ago discovered the charms of these Southern mountains, but their forests grow over rich deposits of coal and iron, and now railroads and the all-destroying lumberman are fast devastating them: with these almost the last uninjured wilderness of the Continent will soon disappear.

The Mines, Miners, and Mining Interests of the United States in 1882. Compiled by William Ralston Balch. Philadelphia: The Mining and Industrial Publishing Bureau.

THIS volume is a thick quarto, containing about 1,200 closely-printed pages. It is a compilation of greatly varied material, consisting mainly of short articles or abstracts from treatises on subjects of more or less importance to persons interested in mining pursuits. Some of the best matter in the book is drawn from the Transactions of the Institute of Mining Engineers and from Government Reports; besides which there are all sorts of articles, items, and tables of statistics from a great variety of sources, including the technical and scientific journals and the newspapers. It is, in fact, a sort of scrap-book, in which, together with much comparatively unimportant matter, there are many things of a high and lasting value. In this respect the book will doubtless be found useful by many persons who dwell in places remote from libraries, and who are therefore unable to refer readily to original sources for much that they desire to read. The compiler has kept in view almost every branch of his subject. In addition to a very large amount of material relating directly to the mode of occurrence, mining and treatment of ores of nearly every sort, and to the several industries therewith connected, he has devoted much space to the mining laws of various States and countries, and to the more noteworthy decisions rendered by the courts in important mining cases. The organization of stock companies, the business of dealing in stocks, reviews of the metal markets and industries, together with a good deal of miscellany of a somewhat similar nature, receive an ample share of the compiler's attention.

So much heterogeneous material naturally presents some difficulties in the way of assortment and classification. The compiler has done what he could to facilitate reference to the contents of the book by an index of fifty pages.

BOOKS OF THE WEEK.

Editor, JULES LÉVY,
17 Story St., Cambridge, Mass.

IN any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address Publisher of the Nation.

Chas. Scribner's Sons
PUBLISH THIS DAY:
Life of Lord Lawrence.
By R. [illegible]NORTH SMITH, M.A.,
Late Fellow of [illegible] College, Assistant Master at Harrow [illegible] author of 'Carthage and the Carthagi[illegible] Rome and Carthage,' 'Mohammed a[illegible]mmedanism,' etc.
With Maps and Portraits. 2 vo[illegible]vo, $5.
These two volumes contain the biography of one of the most remarkable Englishmen of our time. John Lawrence exemplified the highest and most characteristic qualities and virtues of an Anglo-Saxon, and his life is the history, more or less complete, of British rule in India during the most memorable period since Englishmen first gained a footing there.
Lawrence's career is first traced, from the time when he went out as a young student for the Indian service, through the rapid steps that brought him into positions of authority and showed his extraordinary tact and firmness in dealing with the native population, up to the time when his position as the master of Indian administration was recognized in his appointment to the Lieutenant-Governorship of the Punjab. This part of the book not only gives an admirable picture of the man himself, with his iron frame and marvellous energy, accomplishing work enough for twenty ordinary magistrates, but is literally crowded with his own anecdotes of the native life in the midst of which his time was spent.
But it is of course in the period of the mutiny that Lawrence, as the "Savior of the Punjab," reaches his full development, and it would not be easy to exaggerate the power of this part of Mr. Bosworth Smith's narrative in awakening enthusiasm for his subject.
No doubt the chief reason why the 'Life of Lord Lawrence' has been looked for with such extraordinary interest in England, is that it was known to give such a history of this period as could not be written from any other materials than those in his possession. But it will be found that Mr. Smith has given it even greater claims to attention, by making of it one of those great biographies which form, perhaps, one of the most interesting groups in literature—the few books in which a vigorous individuality is brought out with perfect success.

NEW YORK, THURSDAY, MARCH 15, 1883.

The Week.

THE amount of impression made by Wiggins's prediction on the public mind is, like spiritualism, a striking illustration of the small extent to which the masses are still influenced by what is called the scientific spirit. His performance had all the marks of quackery. The events he predicted were prodigious. His storm was not simply to be a March storm of considerable severity, visiting a limited area of the earth's surface, but a world storm, traversing a large portion of the globe, in both hemispheres, and working devastation the like of which on a great scale had not been recorded. A great deal of attention has been devoted by the scientific men of all nations during the last thirty years to the means of forecasting changes in the weather, or, in other words, to the discovery of the law of wind and rain, but nothing has as yet been revealed to make predictions of any kind of weather for more than forty-eight hours in advance anything better than vague conjecture. But the processes by which all that is known has been reached are concealed from nobody any more than the processes of experimentation in chemistry and electricity. There is no pretence of anything supernatural in them. The children are now all taught in the schools that the secrets of nature are to be got at either by experiment or observation, and are taught to distrust anybody who says he can explain natural phenomena in a way only known to himself. They are taught, too, that astrology is humbug; that the notion that the position or movements of the planets influence human life or human affairs is, like witchcraft, gross delusion, and that any one who gets money by it is an impostor.

Wiggins, however, has not only come forward claiming private and exclusive information about natural phenomena three months before their occurrence, obtained from sources known only to himself, and not open to every scientific man, but has had no difficulty in getting hundreds of thousands to believe him, and many to regulate their business according to his advice. Not content with this, he has revived the claims of astrology, as part of his own system, and has made the planets share by their movements in the creation of earthly storms, without apparently shaking the faith of his dupes one iota. To crown all, too, he made his prediction so vast and remarkable that there could apparently be no escape for him if it failed; but the more absurd his talk became, the more effect it had. What made all this the more amazing was that he had already tried his hand as a weather prophet and had utterly broken down, and had had to confess that he had miscarried through some prodigious mistake, such as, if we remember rightly, taking the wrong side of the earth in making his calculations. He is at this moment, too, after having been again exposed, utterly unabashed, and not without reason, and is showing so little respect for the intelligence of his victims as to maintain that two little storms of the ordinary March kind, which occurred Saturday, one in Newfoundland, and one in North Carolina, were really the great world-pervading hurricane which he bid them prepare for.

Nothing very interesting has occurred in what we may call the court-room branch of the Star-route trial, but the outside part of the "case" has been vigorously pushed forward. Rerdell has made public a "statement" in relation to the Belford check, in which he gives further information about it, and declares that he learned from Dorsey and others that it was given to Belford to pay for losses at cards on a railroad journey, and was entered on the books as a "mail" disbursement. To meet this, Dorsey has also given the public a statement, in which he denies emphatically what "the perjurer" says, declares that the card story is a lie from beginning to end, and somewhat obscurely explains it as being "the natural outgrowth of the usual infamy of transmitted power." To clinch the matter, and "nail the lie to the counter" more effectually, he committed an assault in the course of the day on Judge Lilley, an old man of seventy, whom he accused of inducing Rerdell to come forward as a witness. According to the Judge's account, he was struck in the face, knocked down, and kicked in the abdomen by the ex-Senator. This is a new way of getting in evidence which has been ruled out in court, and nobody is better qualified to manage this branch of his case than Dorsey. We are curious to know whether the Court has no control over a desperado such as he when he is actually on trial.

A good deal of criticism has been visited upon Secretary Folger for allowing his gold balance to fall some $40,000,000 since he came into office, through haste to redeem the interest-bearing debt, and especially for issuing a call for $15,000,000 of bonds to be presented on the 1st of May. It would, we think, have been more prudent to restore this $15,000,000 to the gold reserve. The opposite policy has been adopted, probably on the theory that, considering our widely extended territory and scattered population, a smaller reserve is needed against the demand notes of the Government (greenbacks) than is deemed necessary in the more densely populated countries of Europe. There is no other way to account for so considerable a departure from the policy of the Department heretofore. Whether Mr. Folger's policy be correct or otherwise, there can be little doubt that the accumulation of money to meet the bond-call maturing in May is one of the contributing causes to the present stringency in money. It is not the only cause, perhaps not the principal one; but it happens to come at a time when there is a heavy drain of currency to the West. Since the treasury accumulation is not intended to replace the reserve, but to redeem $15,000,000 of bonds at a fixed date, it would seem to be good policy to distribute the payment over the intervening time by anticipating the payment of bonds as far as practicable, instead of locking up the whole amount until the 1st of May, or some later period, when the holders of the bonds may choose to send them in.

The prominent feature of the past week was the decline in rates of foreign exchange to a point that has induced the export of gold from London to the United States, $3,000,000 being now on the way. It is doubtful, however, if this movement will become important. Our exports of both breadstuffs and cotton have fallen off in the past fortnight, and the balance of trade has been less decidedly in our favor than for the four months ending with January. The volume of exports and imports of commodities alone (exclusive of specie) is so nearly balanced that the movement of specie between London and New York will be determined entirely by the movements of American securities. If London buys more American railway stocks and bonds than she sells, specie will continue to come this way in pay for them. On the contrary, if she sells more than she buys, she will get her pay by the balance of trade on the interchange of commodities. Higher rates of interest for money have prevailed here during the past week, and this, too, has favored the movement hither of specie from London. The cause of the advance in rates has been mainly the increased demand at the West for money to move grain, hogs, and cattle, which may be estimated by the fact that the arrivals of grain at the seven principal Western points, in the first week in March, were nearly quadruple what they were in the first week in February. This movement, however, is now diminishing. The farmers will presently all be busy in preparations for spring work, and will not market much grain. The movement of currency will soon be toward New York, thus creating bank balances here available for loans. The last weekly statement of the New York banks showed a large decrease in both specie and legal tenders, the greater part of the former having gone into the Sub-Treasury, and of the latter to the West; but unless the money market is manipulated in the interest of the bears in the stock market, the bank statement is likely to show a gain of legal tenders and specie in the next two weeks. The stock market has been stronger in the past week, and prices have been steadily creeping up for two weeks past, the average advance in that time being from 3 to 5 per cent. on the most active stocks.

There is no mystery about the date when the repeal of the bank tax takes effect, although it seems strange that Congress should have legislated backward so that the tax ceases to take effect from the first of January, 1883, while all the other internal-revenue taxes continue till May or June. When the original bill passed the House last year it was intended to keep the bank tax in force till the following January; that is, some six months after the

probable enactment of the law. The Senate did not pass the bill, but proceeded to amend it by attaching a tariff bill to it, and adjourned in August without action upon its own amendments. When the bill came up again this winter, the tariff branch of the bill monopolized attention in both houses, and the incongruity of dates as regards the bank tax was apparently not noticed. Otherwise the tax would undoubtedly have been continued until the close of the half year, if not until the 1st of January, 1884.

The late George Peabody, among his donations for the promotion of education in the South, besides other gifts, placed 1,000,000 of Mississippi bonds, amounting with interest to $1,100,000, in the hands of trustees. The Mississippians being beneficiaries of the trust, it was thought by the trustees that the State might, under the circumstances, be induced to take some notice of them. Accordingly, in 1871, a memorial was sent to the Governor and the presiding officers of both branches of the Legislature. No response of any direct kind was received, but the memorial seems to have excited a good deal of attention, for an amendment to the Constitution was shortly afterward adopted, absolutely prohibiting the redemption and payment of these bonds; the shrewd Mississippians drawing in the same year the sum of $10,000 in cash, for the benefit of their school children, from the Peabody fund. Strange to say, this neat little operation did not altogether discourage the trustees, for, with what the Boston *Advertiser*, which publishes these facts, calls "fine tact," they got Chief-Justice Manning, of Louisiana, to go to the capital of Mississippi and urge upon the Legislature to make some provision for these bonds. The Chief-Justice has now made his report, in which he says there is no hope. In private life, he says, the action of the State is "deplored," but there is no public man in Mississippi who would dare to bring forward a bill on the subject; indeed, the private gloom is more than offset by the public anger among the politicians whenever the idea of paying the debt is suggested. The more cash they get from the Peabody fund for the schools (they have up to date drawn $69,728), the angrier they get. Tact has about the same effect upon them that it would have on a confidence operator who has got beyond the reach of the law with his plunder.

The facility and the frequency of divorce in the Eastern States are such that societies are organizing to discourage the practice, as there are associations to prevent intemperance in other things, as, for instance, whiskey-drinking. In a lecture in the Centre Church of New Haven, on Sunday, the Rev. S. R. Dyke, Secretary of the New England Divorce Reform League, presented some startling statistics. It appears that while in the year 1849 there were only 91 divorces in Connecticut, now the average is 440 a year. The population of the State has increased less than 70 per cent. in thirty years, while the number of divorces has increased nearly 500 per cent. In Connecticut the ratio of divorces to marriages is 1 to 10.4, in Vermont 1 to 13, in Massachusetts 1 to 21, and in Rhode Island 1 to 10; while New Hampshire, which is sometimes regarded as the type of bucolic simplicity and primitive purity of manners, stands first on the list with a ratio of 1 to 9, though Maine follows hard after, with about the same figures. The lecturer said that "by practising monogamy only could the social fabric be maintained." This is a perfectly just remark, but we have been accustomed to hear and read such observations on the society of Utah rather than on that of New England. The work of reforming the Mormons certainly ought to go on, but something needs to be done in a similar direction in the older parts of the country. United States Senators might urge legislative measures concerning the Latter-Day Saints more boldly, and a certain moral force would be added to the measures, if Mr. Dyke's statistics did not show so large a proportion of sinners among these Senators' own constituents.

Mr. Grimsley, the foreman of the Charlotte (N. C.) *Journal*, walked into the press-room of the *Observer*, of the same place, the other night, and "without saying a word," says the *Observer*, "fell upon our pressman with a knife." He stabbed or "cut" him three times, the last blow being aimed directly at the heart, and would have proved fatal but for "a plug of tobacco, a note-book, and a bundle of letters" which Mr. Stone, the pressman, had in his breast pocket. The cause of this was a previous tussle in the street about a small debt. Mr. Grimsley promptly surrendered himself to the police, and was held to bail in the enormous sum of $100. As he is now at large, and has his knife, it is not surprising, but is somewhat amusing, to see how gingerly the editor of the *Observer* speaks of the affair. He guards himself carefully against expressing an opinion on it, and says, with a kind of shiver:

> "The above particulars of the affair are stated just as they are given to us by Mr. Stone himself and by witnesses to the affray, and are not printed with the intention of prejudicing the minds of the public against Mr. Grimsley, but to give as best we can a plain, intelligible account of the trouble. If Mr. Stone is able to be out, the Mayor will investigate the case Monday morning, when the right and the wrong will both be drawn out."

He evidently thinks Mr. Grimsley would "cut" him in a grievous manner, and that he might not have his plug of tobacco and bundle of letters in the right place, if he condemned the practice of falling on people with a knife without saying a word.

If the Department of State is as sensitive as the Navy Department, Mr. Packard, the United States Consul at Liverpool, may presently find himself sharply called to account for an interview reported by the *Times*. Mr. Packard did not declare flatly in favor of free ships, but he came very near doing so. He said that the American flag is disappearing from foreign ports, while British tonnage is increasing, and he gave some reasons for the contrast, as, the higher wages paid to American seamen; the displacement of wooden by iron ships, and the better freights secured by the latter; the different tax regulations, according to which a steamship valued at $300,000 would pay in this country $5,000 a year, irrespective of earnings, while a ship of the same value in England would not pay that amount until her net profits were $240,000 a year; that iron or steel vessels cost on the Clyde only two-thirds of what they cost on the Delaware; and that "an American cannot own ships until he can buy them to advantage." When the correspondent asked him whether he thought it desirable to change the law, "so as to enable Americans to buy and own foreign-built ships," Mr. Packard replied: "I leave you to draw your own conclusions." The conclusions are so obvious that the Consul's views may be accepted as sufficiently explicit.

The *Christian Advocate* has some characteristic remarks on its share in "the Methodist Mine" affair, of which only one merits any notice. It complains of our failure to mention the fact that its present editor has only held office since his election in 1880, and therefore personally had nothing to do with the swindle, which began in 1878, though only exposed this year. We were not aware of this, and mention it now with pleasure; but we cannot undertake to follow the internal mutations of a religious newspaper. To keep our eye steadily fixed on the organ itself and record its aberrations, especially about Christmas time, is as much as we can do, and far more than is agreeable.

The Earl of Dalhousie, who is the chief promoter in England of the legalization of marriage with a deceased wife's sister, has addressed a circular to the Governors of the States of the Union. It is chiefly remarkable for the extraordinary nature of the extracts appended to it from the *Church Quarterly Review* about the working of such marriages in this country. The evidence of "the American clergyman" on the subject will be read by most people with great amusement, which would probably, however, be changed into indignation if he had given his name. His account of the good old times, when the brother-in-law used to kiss his sister-in-law "in all purity," and when she used to "confide in him without a thought of evil," when the children, too, "loved and reverenced her," knowing their aunt could never be "in any nearer relation to them," is about as repulsive as his account of the new times, in which "there has grown up in families a perceptible and painful feeling of restraint"; and "the children have learned to look with apprehension on their mother's sisters," and "wives have become jealous of their influence with their husbands." We must observe on this that the clergyman seems, when writing his really very simple-minded letter, to have forgotten that there are such things as prurient prudery, and vicious virtue, and indecent decency. A man who only kissed his sister-in-law "in all purity" because he knew he could not marry her, or a sister-in-law who only "confided in him without a thought of evil," for the same reason, and children who only loved and reverenced their aunt because they remembered that their father was forbidden by law from making her his wife, would be a family so essentially coarse-minded that it would be ridiculous to try to improve them by legislation. The best way of dealing with this clergyman would be to compel him to produce a respectable American family where the children are led by the

existing state of the marriage law to regard their aunts "with apprehension." We hope it is not to be found among his own flock, and that the children do not go to his Sunday-school, for they are horrid little wretches.

We have been asked what is the time referred to by the American clergyman, in the extract from the *Church Quarterly Review*, when the relations of American women to their brothers-in-law and of American children to their mothers' sisters were all that could be desired. Did the clergyman mean to say that at one time marriage with a deceased wife's sister was illegal in this country, and that since the change in the law the peace and purity of families have, in consequence thereof, begun to decline? We do not think he meant anything of the kind. He was simply romancing in a vague way without having any fact clearly in his head. He probably had a vague impression that in the early and good times the sisters-in-law and the wives and the children had not found out what the law was, and therefore dwelt in peace and innocence; but that having lately studied up the subject, they have learned to look on the head of their house as a wicked old fellow, who is secretly but constantly contemplating the possibility of his wife's death, if she happens to have a sister. The precocity of the American child has often been commented on; but its having learned to look on its mother's sister "with apprehension," through its study of the Revised Statutes, is the most striking and, we will add, the most alarming illustration of this precocity yet produced.

Herr Most made a stirring plea for his new system of government, on Friday night, in the rear of a beer-shop in Avenue A. He told the audience that there were at least twenty-five kinds of Socialists, and that the term was no longer precise enough. What the real simon-pure Socialists were after, he said, was Anarchism. This he described as a "system of government" in which all "centralization" was done away with. This would look as if it was just what leading Democrats, like Horatio Seymour and Mr. Tilden, had been striving all their lives to secure for the American people; but it seems that Herr Most attaches to "centralization" a somewhat different meaning from theirs. The battle for Anarchism will have to be fought, it seems, not in the primaries, or in conventions, or at the polls, but in the streets. All that is necessary is that proceedings should be begun at once. There is no need of waiting, for "the magazines and warehouses are full of provisions and the banks are filled with money," all of which only needs to be "taken quickly." The audience were greatly delighted with the new kind of decentralization depicted by the publicist, and adjourned amid great applause to Avenue A for beer, which, however, had to be paid for, the shop being owned, as most places of the kind still are, by a rank centralizer.

There could hardly be a better illustration of the way in which legends grow than the effect of the Carey revelations in Dublin in making people in England believe that these revelations show that Mr. Forster was right in whatever it was (never clearly described) that made him leave the Cabinet. As a matter of fact, Carey has revealed nothing of advantage to Mr. Forster, except that he was three or four times in imminent danger of assassination. This gives him a strong claim to sympathy, but it does nothing whatever for his Irish policy. A recent foolish attack on the Ministry by Mr. Gorst, a Tory, brought this out with curious clearness, by compelling Sir William Harcourt to describe, in detail, what the results of Mr. Forster's policy had been, and what part he had taken in what is called the "Kilmainham treaty," and poor Mr. Forster had not a word to say in answer. The legend says that Mr. Forster's coercion was the right kind, because he arrested some of the men who have since turned out to be murderers; but Sir William showed remorselessly that although Mr. Forster arrested 700 men in all, and was going on arresting more and more every day, crimes and outrages steadily increased in number. The legend says that Mr. Forster resigned because he would not negotiate with the Kilmainham prisoners; but Harcourt's report shows that he himself admitted that he began the negotiations, and did not carry them to a successful conclusion simply because Parnell and his friends would not give the pledges and make the concessions he asked for, and that he believed that the Parnellites, if liberated, would use their influence to diminish crime, and that he was perfectly willing to avail himself of it. With the simplicity which seems to be one of the most pleasing traits of his character, however, he wanted Parnell to make an apology which would have forever ruined him in Irish eyes, or in other words, have destroyed the influence which Mr. Forster proposed to turn to account. The other Ministers perceived the fatuity of this, and liberated Parnell without pledges on hearing from him privately that he and his friends would exert themselves for the restoration of order. What adds to the oddity of the Forster legend is that some of the dreadful Irish newspaper articles which he read in the House as proof of Parnell's guilty complicity in the murders, appeared while Parnell was in jail and deprived of newspaper reading, and that the conspiracy which the good man is now pointing to as proof of the wisdom of his policy was formed a month before Parnell was liberated, and that the murders occurred almost immediately afterwards. In other words, all the Dublin horrors were hatched and perpetrated while the Forster system was in full force, and he himself came very near falling a victim to its inefficiency.

The diplomatic correspondence for 1882, now in course of publication, throws a strange, new light upon the character of our Minister to London. A year ago, it will be remembered, loud demands were made for his recall, because there was a terrible suspicion afloat that his heart was not in the right place on the subject of the Irish-American citizen abroad; that he had a sort of British hatred of him, and longed to see him rot ting in a dungeon, if not drawn and quartered, and that he was probably in private egging on the Queen and Parliament to show him no mercy. The charge was apparently made all the more serious and damaging by the absence of facts on which to base it, except the circumstance that Mr. Lowell dined out a good deal in London, wearing on such occasions a swallow-tail coat. It appears, however, from the correspondence between him and Mr. Frelinghuysen that in July of last year he was begging the Secretary to instruct him how he might best protect Irish-American citizens against the operation of the Crimes Act, which provides for domiciliary visits, general warrants, and exile without trial. On the theory of the position of Mr. Lowell's heart, to which we have referred, this act, particularly the clauses applying to aliens, would have delighted him. Now, he would have said, the last hope of the Irish-American citizen is gone; the Queen has "got him where she wants him." But, on the contrary, we find him at once writing to Mr. Frelinghuysen, asking for special instructions as to how he shall protect naturalized American citizens in Ireland—for, says he, "the alien clauses of the act may very probably strengthen the temptation of private enmity to bring false accusations, as it undoubtedly increases the opportunity for them." What is the theory of Mr. Lowell's enemies as to this letter? Is it evidence that his heart is not out of position, or is it a blind to cover his black designs against his unfortunate fellow-citizens abroad?

Prince Gortchakoff's death has been impending so long, and has been so often announced already, that the news of it now makes but little impression. It has, owing to his great age and complete retirement from affairs, no political importance. He has furnished one more of the examples, which are so frequent in European politics, of the preservation of great intellectual vigor and capacity for affairs to a very advanced age. He only left the public service definitively in 1882, when he was eighty-four, and he wrote the reply to Lord Salisbury's Circular, which was equal to any of his state papers, in 1877, when seventy-nine. He was trained in a school of diplomacy of which he and Bismarck were the last surviving specimens of note, which will probably end with Bismarck's death, and which owed its merit and success to the fact that it rested on a single will and had not to make allowances for public opinion. Nothing gives such force and clearness to a diplomatist's action as the consciousness that he knows his master's mind to a certainty, and this consciousness the representative of a popular government cannot have. It is not likely that any Frenchman or Italian will hereafter make much of a figure in diplomacy, and it is becoming increasingly difficult for an Englishman to do so, although the Crown has still, theoretically at least, complete control of foreign affairs. Gortchakoff would never have been Gortchakoff if he had had a parliament behind him, and Bismarck would probably never have been Bismarck if he had a parliament behind him at which he was afraid to snap his fingers, or on which he was dependent for taxes.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 7, to TUESDAY, March 13, 1883, inclusive.]

DOMESTIC.

E. S. WIGGINS, a Canadian "weather prophet," predicted that one of the greatest storms ever known was going to sweep over America and India on or about the 11th instant. His prophecies gained strength from the notoriety given them by the press, and many fishermen along the Atlantic coast did not put out to sea through fear. Many other credulous people likewise put their trust in Wiggins, and were deceived, for though there came a storm on the 7th inst., it was an ordinary March storm. Wiggins, however, claims it as his own (though at the time calling it only "an arm" of the great catastrophe), and says he is well satisfied.

It is understood that President Arthur is contemplating a visit to Florida, on account of his health, and that if he can arrange it he will take the trip within a week or two.

The envoys from the Queen of Madagascar, who are now in this country, were formally presented to the President in Washington on Wednesday, after which they called at the State Department and had an informal interview with the Secretary of State. On Tuesday they ratified the treaty between the United States and Madagascar, concluded by Consul Robinson in May, 1881. The treaty has been proclaimed by the President.

The Attorney-General has given an opinion to the President that the Chief Examiner under the Civil-Service Commission is an officer of the United States, and as such his appointment is vested in the President. The question of the selection of a Chief Examiner has, however, been referred to the Commission, and the appointment will be based upon their recommendation.

The Executive Committee of the National Civil-Service Reform League have adopted resolutions praising the manner in which Mr. Silas W. Burt has discharged the duties of Naval Officer at the port of New York; criticising his removal and his successor, and declaring his removal a "violation of those sound principles of administration which the country has approved, which the President has commended in two messages to Congress, and which Congress has enacted into law." They say that while the nomination of the members of the Civil-Service Commission indicates due regard for the public sentiment which demands reform, the removal of Mr. Burt, with certain other removals and appointments, shows that the course of the Administration on this subject is doubtful and uncertain, and not based upon the fundamental principle of a reformed system—namely, that appointive offices are public trusts in which proved capacity and fitness should be retained, unless the public welfare, without regard to supposed personal, partisan, or factional interests, requires a change. They earnestly recommend to every association composing the National League not to relax its diligence in exposing the abuses and evils which it is the object of the Commission to correct.

The Assistant Secretary of the Interior was informed by telegraph on Wednesday that about 200 settlers recently invaded that part of the Sioux Indian reservation which lies east of the Missouri River and put up shanties there, and that thousands of other settlers are preparing to follow. No action has been taken by the Department, but the intruders will be ordered off the reservation.

The Treasury Department is in receipt of numerous inquiries in regard to the proper construction of certain provisions of the new Tariff Bill. It is stated upon authority that none of these tariff questions will be passed upon by the Department until the new law goes into effect.

The Secretary of the Navy has addressed a letter to the Superintendent of the Naval Academy at Annapolis in regard to the cases of several of the cadets who took a prominent part in the recent meeting there. He says: "It is not the intention of the Department to interfere, except for extraordinary reasons, with such measures and rules as the Superintendent and Academic Board may adopt for the discipline and instruction of the cadets. Such frequent interpositions by parents or influential friends of the cadets would soon demoralize the Academy, and would ultimately change it from a school of special instruction and severe discipline, designed to fit the cadets for the perils, emergencies, and patriotic enterprises of a military life, into an ordinary institution of learning. If it ever becomes such, it should not be thereafter maintained at the public expense of $450,000 annually."

Rear-Admiral J. W. A. Nicholson, lately in command of the European Station, was placed on the retired list on Saturday by operation of the law. He is succeeded in command of the European Station by Rear-Admiral Charles H. Baldwin, formerly of the Light-House Board. Rear-Admiral E. R. Calhoun will be retired in April. These two retirements will make a vacancy in the list of Rear-Admirals, which will be filled by the promotion of Commodore R. W. Shufeldt, now on duty with the Naval Advisory Board.

A statement containing receipts and expenditures of the Post-office Department for the third quarter of the calendar year ended September 30, 1882, shows that the receipts were $10,545,932, and the expenditures $10,188,969, leaving a surplus of $356,963. During the same quarter in 1881 the receipts were $9,490,706 95, and the expenditures $9,686,810 96, making an excess of expenditures over receipts of $196,104 01.

There was another extraordinary scene in the Star-route trial at Washington on Wednesday. James B. Belford, member of Congress from Colorado, testified that he had often urged the Post-office Department to increase the postal facilities of his State, but that he had done so solely in the interest of the people whom he represented. When asked whether or not he had received any money or other valuable consideration for his services in connection with Star-route expedition, the question was ruled out, because the statement made by Rerdell connecting Belford's name with S. W. Dorsey's check-book had been stricken from the record. The witness pleaded earnestly to be permitted to answer the question, and on being dismissed from the witness stand, as he was about leaving the court-room, asserted his innocence in the most solemn manner. He was called back by the judge, who rebuked him sharply and fined him $100 for contempt of court. Rerdell had said that Dorsey's check-book, which the defence refuse to produce, contains the stub of a $2,000 check marked "J. B. B., $2,000, mail."

Another incident connected with this trial was made public on Friday. Ex-Judge William M. Lilley, an old gentleman of seventy, called upon Dorsey at his house on Tuesday, the 6th instant, in company with George H. Brott. After some conversation, Mr. Dorsey accused him of inducing Rerdell to become a witness for the Government. He in reply declared that such a statement was nonsense, and he was then struck in the face by Mr. Dorsey. Throwing himself backward to avoid the blow, his chair was upset, and he fell upon the floor. Judge Lilley says that while upon the floor he was kicked by Mr. Dorsey in the abdomen. Mr. Brott interfered and prevented further action. Judge Lilley is under care of a physician.

General Foote, United States Minister to Corea, who has recently returned from a mission to Panama, where he inspected the Canal, says that a considerable amount of work has been done. The surface of the ground on the line of the Canal has been removed from ocean to ocean. The company has a large number of digging machines at work, and the earth is being rapidly cut away. The workmen are principally Jamaica negroes, and there has been much sickness and mortality among them.

The United States Fish Commission has finished the preparation of its exhibit for the forthcoming Fish Exhibition in London, and a part of it has been shipped. The entire exhibit, which is one of great variety and completeness, will be on its way to London before the end of the month. Professor Goode, of the National Museum, will probably go with it.

Another of Speaker Keifer's methods has been made known. When Keifer had determined to remove Stenographer Tyson in order to make a place for his nephew, he sent for Dawson, another stenographer, and told him that he would be expected to divide his own salary with Mr. Tyson until the meeting of the next Congress. Dawson said that this would greatly embarrass him, for he had entered into financial obligations with the expectation of receiving his own salary during that period. The Speaker gruffly informed him that the matter must be settled at once, and that Mr. Dawson could take his choice—divide his own salary with Mr. Tyson or hand in his resignation. This transaction has come to the knowledge of the Disbursing Clerk of the House, and he says that if Mr. Dawson does not receive the full salary it shall remain in the Treasury.

Alexander H. Stephens was buried on Thursday at Atlanta. The city was crowded, 80,000 people being in the streets on the line of the procession. The military display is said to have been the best ever seen in the South. General Robert Toombs delivered the funeral address. He was much affected, as was also his audience. Among the pall-bearers were General Toombs, Senators Brown and Colquitt, and Governor Smith.

The Michigan Democrats on Wednesday nominated for Judge of the Supreme Court, full term, John W. Champlin; for Regent of the State University, Arthur L. Clark. The Greenback State Convention was invited to unite again with the Democrats on a fusion ticket, and the nominations of a Judge of the Supreme Court, short term, and of one Regent of the University were left open for them. The Greenbackers accepted the offer and nominated their part of the ticket, but adopted a separate platform. The regular Democrats adopted a resolution calling for a "tariff for revenue only."

There is much excitement among the Germans in Ohio on account of a bill which has been introduced into the Legislature to abolish the teaching of German in the public schools. The German newspapers say that the passage of the bill will result in the overthrow of the Republican party, and will insure Democratic supremacy for many years to come. A mass meeting to protest against the passage of the bill was held on Friday night in Cincinnati.

The Indianapolis Committee in charge of supplies for the sufferers on the Ohio River, south of Evansville, Ind., returned on Saturday, and reported great suffering and sickness at nearly all the river towns. At New Franklin, Ind., a village of 120 inhabitants, 30 persons are destitute and 15 sick. In Uniontown, Ky., a town of 1,500 inhabitants, nearly everybody has suffered, and there are 50 persons destitute. In Shawneetown 1,500 persons are destitute, depending on the public for provisions and medicine, and 125 are sick and 24 have died of pneumonia, catarrh, fever, and dysentery. The latter disease has almost become epidemic. About 125 houses have been swept away or damaged, and at least 700 persons are exposed to disease. At Caseyville, Ill., no relief has been furnished. There were 45 cases of sickness, mostly typhoid fever. One death had occurred. One hundred houses had been under water, and half of them were ruined.

FOREIGN.

Socialistic troubles have broken out again in France. A meeting of Socialists was announced to take place on the Esplanade des Invalides in Paris on Friday, and the Government gave notice of their intention to suppress it. On Friday 6,000 persons assembled there, but the police prevented groups from forming and arrested fifteen persons. After the crowd had been dispersed a mob of about 1,000 returned and broke windows and overturned carriages. They were finally dispersed by the police. On Sunday another attempt was made to hold a meeting, but again the police prevented it and made a large number of arrests. It is stated that a great meeting of Socialists will be held on the Champs de Mars on the 18th inst. Louise Michel, one of the ringleaders, is in hiding to avoid arrest.

Advices from London say that the socialistic troubles in Paris are due to the fact that 60,000 persons are out of employment. The London *Times* correspondent at Paris says that many foreigners have kept away from the city, owing to its unsettled condition.

A meeting of two thousand persons was held in Paris, on Sunday, to protest against the action of the Chamber of Deputies, which had adopted a motion rejecting the proposal to consider the question of a revision of the Constitution. The meeting adopted a resolution favoring a revision.

The French Senate on Thursday rejected, by a vote of 169 to 122, the first clause of M. Simon's bill relative to the right of association, and allowing the existence of religious societies; M. Waldeck-Rousseau, Minister of the Interior, having stated that the Government would soon present a bill on that subject.

In the Chamber of Deputies on Saturday M. Waldeck-Rousseau, replying to M. de Cassagnac, said that Republicans condemned and Monarchists encouraged disorderly meetings. M. de Cassagnac protested against the charges made against the Monarchists. He asserted that the Republic was answerable for the riots, which, he declared, were only beginning. He said that whenever M. Ferry was in power the people starved. M. Waldeck-Rousseau rejoined that M. de Cassagnac's speech showed who were pleased at the rioting. After some further discussion the order of the day was accepted by the Government, and was unanimously adopted.

War between France and Madagascar is threatened. Advices from Tamatav, Madagascar, under date of February 26, announce the arrival there of a French gunboat, and four French men-of-war have arrived on the northwest coast of the island. The natives were reported to be excited, and to be making preparations to resist the French and then to retire to the interior. Fanatics are stirring up the natives against the Christians. On Saturday a despatch to the London *Standard* from Vienna said the commander of the French squadron had been ordered to blockade the shore and occupy several ports of the island, but not to send troops into the interior. The secretary of the Malagassy Embassy, now in Washington, Mr. Tacchi, said on Saturday that the Ambassador had received a despatch that morning, stating that the Prime Minister had called a meeting of all the foreigners within a reasonable distance of Tananarivo, the capital, to consider the action of the French "in making war upon Madagascar." The meeting was held January 2, and included representatives of all the foreign elements. The Government assured them of protection, but suggested that no one should venture too far into the interior. Mr. Tacchi stated that the foreigners expressed sympathy with the Government, and that the representative of the leading French house there assured the Prime Minister that he regarded the course of France as prejudicial to the commercial interests of France.

Byrne was released by the French authorities on Thursday, his case not being considered one for extradition.

Mr. Jenkinson, Director of the Irish Criminal Investigation Department of Dublin, asserts that Patrick Egan has been under police supervision for some time, but that he left Ireland on Thursday unknown to the police. Mr. Jenkinson believes that Egan fled because he thought if Sheridan was extradited important evidence would come into the hands of the authorities. Three letters from Egan were found on Carey's premises, dated October and November, 1881, at which time the Invincibles were established. One of these letters expresses the hope that Carey will succeed in the work he has on hand. It is rumored that the Government has received evidence proving beyond doubt that "Number One" is an Irish-American officer of the League, now in America. Egan turned up in New York on Thursday.

Captain O'Shea has written to the London *Daily News* defending Mr. Parnell against Mr. Forster's attack in the House of Commons. He says that immediately after the Phœnix Park murders Mr. Parnell drew up an address announcing his retirement from political life, and was prevailed upon by his friends only with great difficulty to alter his mind.

Lady Florence Dixie, in a letter to the *Times*, charges that Messrs. Biggar and Parnell, as trustees of the Land League Fund, have not accounted for £152,000 of the money with which they were intrusted. She asserts, therefore, that while this money is unaccounted for, Mr. Parnell and his followers have no right to mock the sufferings of the distressed people in Ireland by their sham championship of the starving peasantry.

At a meeting of the Local Board of Swineford, County Mayo, it was reported that great distress prevailed in the district. Over thirty persons are in the poor-house suffering from famine fever. There are 700 names on the list of those needing relief. The distress has not been so great since the year 1847. People who refuse to enter the workhouse are dying from want of food outside. At the opening of the Grand Juries at Sligo and Armagh the judges referred to the decrease of lawlessness in Ireland. A correspondent of the London *Times* in Dublin states that the enrolment of recruits in the ranks of the Invincibles still proceeds, notwithstanding the readiness of the men now in prison to betray one another.

In the House of Commons on Thursday Mr. Gladstone refused to appoint a day for the cussion of the "Kilmainham treaty" negotiations. Sir Stafford Northcote said he would not proceed any further in the matter. In the Committee of Supply the item for the salary of Mr. Trevelyan, Chief Secretary for Ireland, was agreed to by a vote of 156 to 16. The Irish members raised the question of the relief of distress in Ireland. On Saturday Mr. Trevelyan assured the House that the condition of Ireland was more tranquil than it had been for some time. On Monday Mr. Gladstone stated that Earl Spencer had retired from the office of Lord President of the Council; he also said that he should propose that the House adjourn from the 20th to the 29th inst. for the Easter holiday. The Parnellite attacks upon the Government continue. On Thursday Mr. O'Brien made a fiery speech in which he declared that Mr. Trevelyan was deserving of execration in Ireland. Mr. Trevelyan in reply called attention to the fact that Mr. O'Brien's newspaper (the *United Ireland*) had successively attacked with singular ferocity Mr. Forster, Mr. Burke, Justice Lawson, and Juror Field, and asked the House to remember that the connecting link between these four was the same paper which now attacked himself as the man most hated in Ireland, and more inhuman and destitute of feeling than Mr. Forster.

The condition of the Transvaal was discussed in Parliament on Tuesday. In the House of Commons Mr. Gorst, Conservative, moved that, in view of the complicity of the Boers in the cruel attacks on native chiefs, energetic steps be taken forthwith to secure a strict observance of the convention of 1881. The Hon. Evelyn Ashley, Under Colonial Secretary, replied that if England sent a force to the Transvaal to prevent marauding, the force must remain there, and if such a policy was pursued, it would lead to war. He believed the Boers were amenable to English public opinion.

The returns issued by the Board of Trade show that during the month of February British imports increased, compared with that month in last year, by £3,887,000, and that the exports during the same period decreased £645,000.

At a meeting of the committee of Virginia bondholders in London on Saturday it was resolved to do the utmost to vindicate the claims of the bondholders upon the State of Virginia, and to advise the holders not to take any step toward converting the bonds under the Riddleberger act.

The Anarchists in Spain have quieted down somewhat and confine their operations to sending threatening letters. The total number of persons arrested in Andalusia for complicity in the Anarchist movement is 1,200. Of this number 300 are charged with murders, agrarian outrages, and with being abettors of the "Black Hand" society. Sixty of the prisoners have confessed their complicity in four murders.

In the Spanish Chamber of Deputies on Monday, Señor Cuesta, Minister of Finance, read the budget for 1883–1884. The revenue estimates amount to $160,475,375, and the expenditures to $160,328,075. The extraordinary budget estimates the revenue at $7,386,210, and the expenditures at $6,065,475.

A despatch from Berlin on Thursday said that the appointment of General Blumenthal as Minister of War had been revoked, and that General Bronsart von Schellendorff had been definitely appointed in his stead. The Diet on Wednesday, on the third reading of the budget, rejected by a vote of 192 to 191 a proposal to reinsert the item for the Economic Council, which had been previously erased. On the same day the Minister of the Interior, replying to a Danish Deputy, said the enforcement of military service in Schleswig would only affect 450 citizens, and that the measure was free from any element of terrorism, and would not inflict needless hardship.

Prince Gortchakoff, ex-Chancellor of the Russian Empire, died at Baden-Baden on Sunday. He was born in Moscow, in 1798, of one of the most illustrious and ancient families of the Russian nobility. He entered the Russian Foreign Office at the age of twenty-five, and rose rapidly. He was sent as Ambassador to Vienna during the negotiations which preceded the Crimean war, and displayed great ability. After the Congress of Paris he was appointed Minister of Foreign Affairs. In 1863 he was appointed Chancellor of the Empire. During the civil war in the United States he proved a warm friend to the North, and by his decisive action in refusing to join England and France in recognizing the South, and bringing diplomatic pressure to bear on the Federal Government in 1863, he did a great service to the United States. In April last he retired from public life.

M. Coumoundouros, the Greek statesman, died in Athens on Saturday. He was Prime Minister of the kingdom several times from 1866 to 1882, his last term ending in March, 1882. Since then he has led the Opposition in the Chamber of Deputies. The Chamber of Deputies has adjourned until the 16th inst., out of respect to his memory, and a public funeral is proposed.

The Porte on Monday informed the United States Minister, and other foreign representatives, that the treaties of commerce will expire on March 12, 1884. It is believed that there will be no difficulty in concluding new treaties, involving increased import duties of from 8 to 20 per cent.

MR. BURT'S CASE.

THE action of the President in removing Mr. Burt from the Naval Office and putting in his place an inexperienced man, nearly as well known for his hostility to civil-service reform as Mr. Burt for his support of it, has been condemned severely by the Civil-Service Reform Association of this city. They pronounce his removal an "ingenious device," "a serious blow at the reform in its strongest hold," and "a violation of the sound principles of administration" which the President commended in two messages to Congress.

The matter has a permanent importance, because it is impossible not to regard the treatment of Mr. Burt as an indication of the spirit in which the President proposes to carry out the pledges of his message, in the execution of the law. As such, the friends of civil-service reform, who mean that politicians shall no longer turn the question into a farce, will need to keep it in remembrance. If a faithful and competent man were made, in private business, the object of any such ingenious device as that which has been practised on Mr. Burt, the perpetrator would justly forfeit the confidence and respect of those who had dealings with him. In the ordinary affairs of life a man of good standing cannot afford to seem tricky or evasive toward either his customers or his employees. He cannot afford to keep a pledge by sticking to the letter in a way which grossly violates its spirit. It is considered disgraceful for him to do so.

In "politics" the code is somewhat different. There tricks and evasions are too often part of the game, and a man may be guilty of any number of them towards his associates without losing his reputation, as long as he does not prove false to his party. It is the application of this code to the transaction of the business of the Government—that is, the administration of its financial affairs—which has made the Civil-Service Reform Bill necessary. But the bill will not at once, it is evident, put a stop to this trickiness. On the contrary, there is much reason to fear that it will be executed in the old tricky spirit, and that Mr. Burt's "promotion," by which Jake and Barney are hugely delighted, is a fair specimen of the way in which attempts will be made to nullify it, or turn it and its promoters into ridicule. In other words, politicians have not yet, by any means, accepted the principle of the bill—that Government business is like private business, and should be transacted under the same conditions. In fact, it would seem from the Burt case as if they looked on the bill not as a prohibition, but simply as a new difficulty to be overcome.

If Mr. Burt had been for many years the faithful and competent cashier of a bank at $8,000 a year, and had made himself prominent in advocating a change in the mode of keeping the books, and had at last won the stockholders and directors over to his plan, and the President had been ordered to adopt it, he would not dare to take Mr. Burt out of the cashiership and make him head bookkeeper at a salary of $3,000 as a reward for his pains. A president who did such a thing would be considered too smart by far for the banking business, and would find no one to chuckle with him over it as a good joke on the reformer. It may be said that it was not unreasonable for Mr. Arthur to suppose that Mr. Burt would be willing to make some sacrifice for the cause of which he has been a prominent supporter, by taking a place under the new Commission for which he was eminently qualified, even if the salary was lower. But admitting this, in what way would a President who had no end in view but to promote the success of the civil-service-reform experiment have naturally gone to work to get Mr. Burt to consent to the sacrifice? In what way would it have been managed by the head of a private firm, or by the chief executive officer of any other civilized government? Would he not have sent for Mr. Burt—who, be it remembered, has earned respect and consideration by twenty years of faithful service—and explained the situation to him, and have asked for the sacrifice in language which would have satisfied everybody of his good faith towards the public and kindly feeling towards him?

Nothing of this kind was done. The whole affair was managed in the old sly method with which everybody who has seen anything of ward politics is familiar, so as to convert the change into an inexcusable wrong to Mr. Burt, and a sort of mockery of the reform of which he has been an able and persistent advocate. He was not consulted about the change. He was kept in complete ignorance of the President's intentions about his office, both before and after the expiration of his term, while Jake, Mike, and Barney were running to and fro predicting his dismissal and chuckling over it. Mr. Burt's first knowledge of what was in store for him came from the announcement of his successor's appointment, the successor being a man who has all along been an opponent of the reform which Mr. Burt was asked to aid in carrying out at a loss of sixty-six per cent. of his income.

Another consideration which the affair puts in a strong light is the aid which the Act of 1820 affords, and will always afford, in frustrating any scheme of civil-service reform. It is more than probable that if Mr. Burt's four years' term had not expired, President Arthur would not have ventured to shelve him in this way. It requires some courage, and will probably require more every year, to remove a good officer without cause. The tenure of short terms, however, saves the appointing officer the trouble and responsibility of removal. It makes a vacancy, and gives notice to the Jakes, Mikes, and Barneys when it will occur, and thus enables them to get ready for it. This is what it was meant to do when it was passed, and its repeal is one of the things for which reformers still have to work.

COLUMBIA COLLEGE AND THE PUBLIC.

THE *Tribune* reported recently an interview with Mr. Hamilton Fish, the President of the Board of Trustees of Columbia College, touching the pecuniary condition of the college and its ability to meet the demands made on it by the friends of the higher education of women, which contains some interesting information. The policy of the college has hitherto been to treat its financial affairs as strictly private matters, with which the public had no concern. This was long pursued by Yale and Harvard, but was some years ago abandoned by Harvard and has more recently been abandoned by Yale, to their great and manifest advantage. The objection to secrecy, or at all events non-publicity, about the accounts of a college is, that the public, on the well-known principle of *omne ignotum pro magnifico*, always imagines it to be much richer than it really is, and the prevalence of this feeling prevents that public interest in its needs and its doings without which no college, in this country at least, can prosper and exert legitimate influence. No properly-conducted college in our day ought to be rich in the sense of having more revenue than it needs, because its needs ought to be limitless, and its revenues never are. In fact, poverty is the first duty of every college, and it ought to exhibit this poverty constantly to the public in proof of its efficiency. Mr. Fish says:

"Columbia College has only had two gifts in the form of money, and one of them is of no avail yet. About forty or fifty years ago the chair of German was founded, and a year ago, by the death of Stephen Whitney Phœnix, the college received a bequest which will be available some time hence. There has been an occasional scholarship established; but compare this record with that of Harvard and other large colleges. They are constantly receiving large contributions."

"I attribute this lack of interest toward the college partly to its being in this city. It is lost sight of in this centre of business, fashion, and pleasure, surrounded as it is by other institutions of learning, libraries, and museums. Why, Harvard is the great thing in Boston, as Yale is in New Haven; and the town of Princeton would be unknown were it not for Nassau Hall. Such a state of affairs does not exist here, and yet Columbia is doing a great work with the means at her command."

"Another reason why the claims of Columbia have not been recognized is, that Columbia College has never received from the press of this city the credit she is entitled to. There has been a feeling that this college was under the influence of the Episcopal Church, and that it had an immense endowment fund. In regard to the first statement, it is true that the grant of land down town was given with the pledge that the President should be a communicant of an Episcopal church, but the charter expressly prohibits any one religious sect from having a majority in the Board of Trustees. My predecessor in the presidency was the Rev. Dr. Knox, of the Collegiate Church. The Rev. Dr. Gardiner Spring, of the Brick Presbyterian Church, and the Rev. Dr. Williams, a Baptist clergyman, have been members of the Board, and now there are several denominations represented there."

Harvard College, as is, we believe, admitted, owes a great deal of the munificence of which it has been the object during the past fifteen years to its practice of publishing full and minute statements of its affairs, and thus making known to every one concerned all that it is doing and all that it would like to do, if it had the means.

That Columbia College is extraordinarily well off as regards the "general fund," over which the Trustees have complete control, and which in Harvard and other colleges is lamentably small, may be inferred from President Barnard's statement to the same reporter, that although the college has just contracted a debt of $1,000,000, it will be able to pay it off by 1890, out of its income, without interfering with its present curriculum, and that before 1890 its annual income will be increased $187,000 by the rise in the value of its property. No other institution of learning in the country

can make such an exhibit, or anything approaching to it. Harvard has had a deficit for the past three or four years, and this year is barely making ends meet.

Mr. Fish's explanation of the small impression made by the college on the public mind in this city is perhaps in part correct, but we think only in part. The slenderness of its hold on the affection or remembrance of its graduates is doubtless the inevitable result of the non-residence of the students. It is almost impossible for a college to be a real Alma Mater to students who are dispersed through a great city as soon as the lecture or recitation is over. But as Columbia has deliberately chosen to be a city college, without dormitories or discipline, it should, it seems to us, adapt itself to the situation, and endeavor to increase in every way possible the number of points at which it can come in contact with the life, and the number of channels through which it can exert an intellectual and social influence on the youth, of the city. For such a college a secluded, conservative, mediocre existence ought to be an impossibility. It ought to appeal to the popular imagination by frank statements of what it is doing and trying to do for literature, science, and art; and it ought to save itself in this from any imputation of demagogy, by having high standards, and giving instruction so thorough and exacting that none but the well equipped can take it. Its lectures and examinations ought to be such as to confer some distinction on those who attend and pass them, and to create a body of youth of both sexes in the "good society" of New York, who would have some of the marks of a *corps d'élite*, and have better topics of conversation at dinner-tables than the last german, the amount of their host's fortune, or the newest thing in liveries. The more difficult it is to form an intellectual centre in New York, the greater the responsibility which rests on its old and rich university.

This consideration has, we confess, seemed to us to furnish one of the most powerful arguments in favor of its doing something for the higher education of the young women of the city. Probably nothing would do more to make the college a social and intellectual influence than to open its doors to women who wished to learn, and were willing to work, and we may be sure no others would seek admission. A large body of young women who felt they owed it something would assuredly be excellent advocates of its claims on rich men's munificence. By this, we again repeat, we do not mean co-education, though we suspect that there is no college in the country in which co-education would be open to less objection than Columbia College, because its instruction would do no more to bring the sexes together than the morning and afternoon amusements of all sorts now do.

THE PARISIAN RIOTS.

The suppression of the socialistic *émeutes* in Paris without any extraordinary display of force, and without bloodshed, and the arrest or flight of the ringleaders, must be considered a triumph for the Republic, and it is perhaps a greater one than it appears. It is the more valuable because there is hardly a doubt that the mob was egged on by the Legitimists and Bonapartists, who are interested just now in spreading the belief that the Republic cannot maintain order and protect property. The outbreak, too, could hardly have occurred under more favorable circumstances. The instability of the Ministers had prepared the public mind for the idea that the Republic was unstable. Prince Napoleon's escapade and the increased audacity of the Legitimist talk had spread abroad the notion that something serious was impending, of which they hoped to take advantage. The Government had also shown great want of firmness in the prosecution of the perpetrators of the outrages in Lyons and at Montceau-les-Mines. The finances were confessedly in a bad way, and Gambetta, who had the reputation of being the main defence of France against extreme Radicalism, was dead.

So that it is not surprising that Louise Michel and her friends thought the time for action had arrived, and that they might indulge at least in the preliminaries of a revolution by huge demonstrations, and perhaps by a little barricade-making, just to see what metal the authorities were made of. This stage is the critical one in all French troubles, and if the Government meets it with hesitation things are sure to go further and get very much worse. Charles X., in 1830, and Louis Philippe, in 1848, both fell victims to the want of resolution at this juncture. They furnished all the signs that the rioters needed, to show that the men in power were not quite sure of their position and shrank from bloodshed. Louis Napoleon was so determined to avoid this error in 1851, that he swept the fronts of the houses on the Boulevards with musketry, and shelled barricades that might have been carried by a rush of policemen. President Grévy has no need to go so far, because he has followed up the crowds with the gendarmes and cavalry with such persistence that they have not had time to grow, and the ringleaders have been collared and dragged to the police stations in such numbers as to show that the Government does not rate them very highly. Even this has cowed them so much, however, that many of the chiefs, including Louise Michel, have fled.

It must not be inferred from all this, however, that the Socialists are not going to give any further trouble. The vote at the election of Gambetta's successor in the Twentieth Arrondissement in Paris shows that the socialistic or, rather, anarchical ideas are sufficiently diffused among the city population to make them a source of danger for a long while to come. Out of 7,070 votes cast, 1,554 were those of "Collectivists" or "Anarchists." Collectivists are persons who hold that all the materials of production should be owned by the state, which would then deal out work and provisions and clothing to each according to his necessities. The Anarchists have no views regarding the future organization of industry or the tenure of property. They reserve these things for further consideration. The immediate work before them, they hold, is the destruction of all existing restraints on the individual man or woman, whether legal or social. Both Collectivists and Anarchists, however, agree that the first thing to be done is to clear the ground of existing institutions, and in the work of preliminary destruction they would undoubtedly act together. They, therefore, from the point of view of owners of property, may be considered as forming one party. That persons holding such views should constitute nearly one-quarter of the voters, even in a Radical district in Paris, is certainly enough to make any Government uneasy.

But the French Government has one source of consolation which it has not had hitherto. When the inroads that socialistic and nihilistic ideas had made among the working classes were first revealed to the world in 1848, French society was looked on with scornful pity by Russia and Germany, which were supposed to be secure against all poison of this kind, in virtue of their sound religious and political training; and Spain was so far removed from it as to be devoutly Catholic. At this moment there is no country in which the Anarchists are so dread a power as in Russia. In Germany, Socialism has called for special measures of repression, has put the sovereign's life in danger, and constitutes a distinct cloud on the future of the empire. In Spain, to-day, the Government is contending with an Anarchist organization on a great scale, which seems to practise all the leading crimes of Anarchists elsewhere. It murders like the Russians and Irish, rebels and destroys property like the French, and has, besides all this, a special department of brigandage which is unknown in other countries. In other words, the Spanish "Black Hand" is not willing to wait for a regular division of goods, or for the establishment of anarchy on the ruins of modern society. He helps himself in the meantime to such articles as seem likely to make the path of reform less thorny, and give him a tangible foretaste of the good time coming.

MR. FORSTER AND MR. PARNELL.

London, March 1, 1883.

It is a fortnight to-day since Parliament was opened and the debate on the Address in reply to the Queen's speech began; and that debate remains still unfinished. It has been in the main a dull debate, throwing no fresh light upon the questions of present importance, mostly filled with recriminations as to events which happened months ago. But during two nights it rose into a passionate intensity which recalled the angry scenes that accompanied the passing of the Coercion Act in the beginning of 1881, or those of last May, when Mr. Forster's retirement from office and the release of the three "suspect" members from Kilmainham jail startled England, and seemed for a time to imperil Mr. Gladstone's Ministry.

Your readers have already learned how great was the impression made in England by the disclosures of Kavanagh, the car-driver, and Carey, the Dublin Town Councillor, regarding the murders of Lord Frederick Cavendish and Mr. Burke, in the Phœnix Park, nine months ago. These informers not only unveiled a terrible conspiracy, but they showed that this conspiracy, instead of being, as had been previously surmised, concocted and organized by American Fenians from America or from Paris, was really a home growth, planned in Dublin and carried out

by people permanently resident in Dublin, who had presumed so much on the fidelity of their associates or the sympathy of the populace that they had not even sought to escape when the deed was done, but began, after some months, a fresh course of murderous crime. Carey, moreover, went further. His evidence implicated some active members of the Land League, and asserted that money came to the conspirators from Land League funds. Thus the indignation roused in England turned more markedly than ever before upon the Land League as a whole, and even ran on, in the minds of many, to inculpate the Parliamentary leaders of that organization, although Carey had said nothing about them. It was generally felt that Mr. Parnell, in particular, was put upon his defence, and that he ought to take the first opportunity of disclaiming all connection with the authors of outrages, and proving that he and his brother chiefs had known nothing of the way in which Land League money was, as Carey alleged, being expended. People flocked to the House of Commons to hear what the Nationalist leader would say, although he gave no indication as to whether he would say anything. While one speaker after another attacked him from the Conservative side, he remained silent. But at last a challenge of a different kind was made. Mr. Forster, who rose with so large a bundle of papers in his hand that it was plain his speech would be a long one, delivered such an attack as has seldom been listened to in any representative assembly.

The ex-Chief Secretary for Ireland is not, in the ordinary sense of the word, a good speaker. He is not fluent; he has none of the graces of diction or delivery which are often found even in those in whom art and study have supplied the want of natural gifts for oratory. But he has great force—force of character and force of conviction. He detests the Land League and its leader, and detests it not the less because he thought that the way in which the suspect members were set free last May was substantially a victory for them, and an improper concession to turbulence and outrage. Thus he threw the whole force of his nature into the invective which he launched at Mr. Parnell. Rarely, if ever, has he been so powerful or produced such an impression on his audience. It is true that the charges he made were mostly founded either on speeches made by Mr. Parnell as far back as 1880, and which had been often referred to before in Parliament, or else upon articles in newspapers (the *Irish World* and *United Ireland*), for which Mr. Parnell might (and did) deny responsibility. But accusations which in themselves were old or susceptible of a reply gained weight from the recent disclosures, and, to an audience three-fourths of which had just been shocked and startled by those disclosures, appeared new and overwhelming. The repeated interruptions of one passionate member of the Nationalist party, whose cries were at last silenced by his suspension from attendance in the House, added to the general excitement. To all appearance, Mr. Parnell was the coolest person present. While the late Chief Secretary charged him with either conniving at murder and outrage, or at any rate doing nothing to check them, he sat calmly regarding his antagonist, with a scornful smile, which was, however, evidently the result, not of indifference, but of intense self-control, and showed how fully he reciprocated Mr. Forster's own feelings toward him. When Mr. Forster ended, he did not, as was expected, rise at once to reply, but remained silent during the rest of the evening. Lord Hartington, who, as leader of the majority in Mr. Gladstone's absence, rose to wind up the debate, repeated in grave and stern language the demand which had been made by others, that he should offer some defence or explanation, and warned him of the interpretation which might be placed upon his silence. Upon this, Mr. Parnell announced that it was his intention to speak on the day following.

An even more curious and excited crowd gathered then to hear him. Most of them went away disappointed, for they did not receive that categorical and specific reply to Mr. Forster's indictment which they expected. But his refusal to plead was almost more impressive than any pleading could have been. He told the English and Scotch members that he and his colleagues did not care for their opinion, nor for any English opinion; that they valued, and sought to justify themselves to, the opinion of Ireland only; that he regarded the English and Scottish part of Parliament as too hopelessly prejudiced and ignorant to be capable of understanding, or believing, or appreciating any defence he could offer, and that he would therefore offer none. On some minor points he did meet Mr. Forster; on others he brought counter charges against the latter. But in the main he left, and was content to leave, the case where it stood, expressing the hostility of Irishmen toward England, their distrust of her, their disbelief in the possibility of her comprehending them, with a cold, hard, dry bitterness which proclaimed that all the efforts at conciliation which the Government and their supporters have been making or trying to make during the last three years had been thrown away. English members, who had not realized what Irish feeling is—and there are still many such—were shocked as well as disheartened. But among the Tory party the sentiment seemed to be that the folly of the Ministry in supposing they could reconcile Ireland by Land Acts and Arrears Acts had now been demonstrated, and that the policy of severe repression would now need no further arguments for its justification.

The part played in all this by Mr. Forster is very differently regarded by different sections. Among the Conservatives, and in society generally, which is in London substantially Conservative, his reputation has never stood so high as it does at this moment. What has been revealed by Carey is held to show that in the crisis of May last which led to his leaving the Cabinet, Mr. Forster was right and his colleagues wrong. He has become the representative (though he has never stated and would probably repel such a view) of the doctrine that what Ireland needs is repression, not relaxation, and that there must be no talk of any establishment of local government, or other yielding to popular demands. He is considered the embodiment of order and firmness standing armed against secret crime. A similar approval of his conduct is accorded him by many Liberals, especially those who belong to the less advanced groups. The *Times* is vehement in its applause, and contrasts him with his colleagues, much to their disadvantage. The Irish Tories, who did not treat him well when he was in power, are now full of friendliness. It is, however, very hard to get praise from opponents without incurring censure from one's own side; and a good deal of such censure is visited on Mr. Forster, although little open expression has been given to it. He is accused of having injured his former colleagues in the process of vindicating himself. Some think that his attack on Mr. Parnell would have been more effective if it had been quieter, and that it ought to have consisted not so much in raking up old speeches, as in showing how much ground he must have had all along for suspecting that the Land League organization was being used to help outrages. Others hold that nothing has been gained at all by the onslaught upon the Nationalist leader, which has only enforced what was known before, and brought out into stronger relief the unpleasant hostility to England of the extreme Irish party.

Although this has no doubt been the chief result, it cannot be said that Mr. Forster's indictment and Mr. Parnell's retorts have not altered the ordinary English view of the Land League and its chief. They have certainly made any future coöperation between him and any large section of English politicians even more difficult than it was before. Unless Carey's story should be discredited at the approaching trials in Dublin, they will make public opinion in Great Britain associate the League leaders with outrage and conspiracy far more closely than has heretofore been the case. It is true that any good observer might have seen long ago how the matter stood: how certain it was that an organization like the Land League would overlap other and more secret organizations; that some of its members would not shrink from criminal means to accomplish their ends; that some of its funds would find their way into unscrupulous hands. All this was in the highest degree natural and probable. All this was compatible with the fact that the objects of the League were, at least originally, legitimate; that its avowed means—agitation by meetings and through the press—were legal also; and that its leading members may have wished and intended and directed that nothing of a criminal or seditious nature should take place. However, English opinion, which, though of course far from lenient to the League, had not realized the extent to which desperate men, the survivors of Fenianism and their disciples, existed in Ireland, ready to make the most of the League, has now leaped to the conclusion that every Land Leaguer was a possible Fenian, willing to approve whatever the most violent Fenian might do. Hence, not only a strong momentary irritation against the Nationalists, but also a smaller possibility of any friendly relations in the future between them and any conceivable English Ministry.

After the excitement of the encounter between himself and Mr. Forster, Mr. Parnell's subsequent indictment of the Irish Government for their administration of the Prevention of Crime Act fell flat. He was not even supported in it by the whole of his forces; but whether this is due to dissensions in the Nationalist party or to other causes, does not yet appear. After this came a statement by other Irish members of the distress of the peasantry, with demands for more indulgent grants of outdoor poor-law relief, and for the employment of the poor upon public works. Mr. Trevelyan has resisted these requests, and is thought to have made out a good case for doing so when he urged that lax and indiscriminate out-door relief would only demoralize the indigent and prolong their wretchedness by keeping them from emigrating; and that it was far better that they should be tempted to leave those congested districts in which pauperism is chronic. Meantime, the debate on the Address, of which all these discussions are episodes, still drags its interminable length along. People have begun to ask what is the use of an Address at all, and a debate upon it. If it is open to so much abuse, may it not be better to drop it altogether? Others think that the power of closing debate given by the Rules of Procedure passed three months ago ought to be exercised. It is, however, not easy to put that power in force, for the Tory Opposition is quite as answerable as the Irish Opposition for the length to which this debate has run. So much alarm was felt at the passing of the closure resolution that the Government are loth to resort to it, or to let it begin to be used under any but the strongest and clearest necessity. Meantime, Mr. Gladstone is

just landing in England, and his arrival may be expected at once to stimulate the efforts of his party to make some progress with public business, and to rouse the Conservatives to more angry attacks on his policy. Much as they dislike it, they dislike him even more, and are embittered by his presence and the vehemence with which he presses onward in his path. Y.

PARLIAMENTARY OPPOSITION IN GERMANY.

BERLIN, February 23.

LAST Friday night the German Reichstag, after having passed the Budget for 1883-84, took its recess, not because it had finished its business, but for the reason that it had to make room for the Prussian Landtag, which before April 1 must pass its budget. The Reichstag adjourns one day and on the next the Landtag steps in; there is such a perpetual and irregular change in their meeting that even our political laymen confound the one with the other. For an American reader it is hardly possible to mark the difference.

Both legislative assemblies have more Conservative than Liberal members, but the former nevertheless command no majority, and the latter, if not carrying their own point, are, by concentrating their action, at least strong enough to set aside the most obnoxious reactionary schemes. Thus the Government in some of its pet measures suffered a signal defeat. The Reichstag, without even a word of debate, rejected the two years' budget and confined its action to that of 1883-84. The Government's endeavors towards the reintroduction of mechanic guilds, by allowing only those masters who were members of a guild to engage apprentices, were sadly defeated, and simultaneously with this bill the plan of introducing workingmen's pass-books in order to control them better was withdrawn. The Landtag has just rejected the license bill, laying a heavy tax on the tobacco, beer, and whiskey retailer; only five votes were given in favor of the measure. Yesterday the ultra-Conservatives hissed the Secretary of the Treasury for not fully agreeing with them on the particulars of some financial questions; and these childish demonstrations came from the Government's stanchest supporters, while His Majesty's most loyal Opposition cheered the Secretary's remarks.

Thus far the socialistic and so-called reform measures of the Government have met with no success whatever. The other day the Prussian Landtag did a good work by refusing a second time the funds asked by the Government for the "Conseil Supérieur" (*Volkswirthschaftsrath*). The Reichstag some time ago rendered the same service to Germany; but I apprehend that, nevertheless, the matter will again be brought before the House. In other countries, the Ministers of State, when defeated, send in their resignations; with us, they consider an unanimous vote of distrust by Parliament as a feather in their cap, and as a new lease of power.

A bill brought into the Reichstag by the Conservative hotspurs, highly taxing the Exchange, is likewise doomed to failure. Its originators have manifested such an ignorance of the elementary laws of economical science that an errand-boy of any New York banker or broker is an expert in comparison with these agrarian gentlemen. "The Exchange is a poisonous tree," exclaimed the other day Herr Maybach, Minister of Public Works, and formerly of Commerce. "It consumes the marrow of legitimate business," cried his satellites; "It is feeding rich Jews," the so-called anti-Semites joined in, and they all coalesced in an effort to lay heavy taxes on any transaction, for cash or on credit, entered into at the Exchange. When at last the honest squireens and their followers could not help seeing, from the arguments of their adversaries, that they, too, would be sufferers if such a suicidal policy were carried out, they fell back on another stratagem. "Why trouble ourselves with specifying the amount to be realized by taxing the Exchange? Let us lay a fixed impost on it! Let it pay so many millions, and let the different members of the Exchange tax themselves for the share each individual must pay." As this method of arriving at the legal solution of a difficult problem is a rather uncommon one, for which reason the opponents of the bill refused to volunteer their services, the Committee dropped its work, and will leave it to the Reichstag. It is needless to add that the latter will still less be able to accomplish anything without having a draft of a bill submitted to it. To complete my sketch of the united wisdom of the Conservatives in framing laws to regulate trade and commerce—there are eleven Conservatives and ten Liberals in the Committee—I will mention a characteristic anecdote. In the debates on trying to make the Exchange "bleed," a question arose as to the proper functions of banks of deposit and checks in daily business. A learned Marburg professor of history and law, Mr. William Arnold, who is well versed in the history of the migration of nations and of the Merovingians as well as the Carlovingians, is a member of that committee. On being informed how and why such banks were created and patronized by business people, and that they were indispensable for almost all business transactions, the learned gentleman indignantly exclaimed: "Why should we feed these suckers? We have good savings banks; let our merchants not be too proud to deposit their money there and withdraw it when they see fit!" *Ex uno disce omnes!*

Another trait of the ingenuity and shrewdness of our agrarians is this: Like a poor lawyer who hunts up precedents, they eagerly look out for institutions, belonging to other nations, which they might use to their special advantage. Among their recent discoveries was your "Homestead Law." As if by agreement, some months ago, a cry of admiration was raised in the agrarian organs and agricultural associations that the American Homestead Law was the pride of the age, and that in order to save German agriculture it should be introduced here at once. Young Bismarck, a member of the Prussian Landtag, praised the American law as the greatest boon, and in doing so proved that he, like his friends, knew very little about what he wished to have introduced as a domestic institution in Germany. These gentlemen confound (or rather combine) the United States Homestead Law—which, free of charge, bestows 160 acres of unoccupied and undisposed-of land upon every bona-fide settler—with the laws of individual States exempting a certain amount of debtor's property from being levied by the Sheriff. The State of California, which exempts even $5,000, is the great idol of young Bismarck and his kidney. American reality thus represents itself to their fancy: *First.* Uncle Sam makes them a present of 160 acres of land. Where they are situated and what it will cost a new-comer to reach them, does not trouble our enthusiasts. *Second.* This property cannot be foreclosed, however indebted it may be. *Third.* The value of $5,000 must be left to the debtor; the Sheriff can only levy the surplus of that amount. Thus the undisturbed possession of a nice little farm and the comfort of a snug house are secured to the debtor, who laughs at his bloated creditors when they threaten him, or even after they have recovered judgment against him. What a glorious country these United States must be; they really are the safe refuge for all who are oppressed by cruel laws made in the interest of greedy bloodsuckers! They now will even find grace in the eyes of Barons Strudelwitz and Prudelwitz. On a closer study the agrarians, however, have found out that their enthusiasm for your Homestead Law was a little premature, and that there are some drawbacks; consequently they now keep quiet. The gentlemen who the other day had to report to the general German Agricultural Association on the American Homestead Law, in rather low spirits declared that, attractive as that law might appear at first glance, its introduction into Germany would be so difficult that the subject must be dropped from the order of the day.

The conflict with Rome has lately reappeared in the foreground of political events. You will have learned by the telegraph that the German Emperor on December 22 last wrote a conciliatory answer to a letter from the Pope, which the latter on December 3 had sent him, thanking him for his kind words about the Church on opening the Landtag. The Emperor's answer was countersigned by Bismarck as Minister of Foreign Affairs, to engraft upon his master's words the dignity of a highly official state paper. He openly expressed his desire of coming to terms with the Pope, and formally declared that if the Church would, as in duty bound, announce to his Government the names of the priests appointed to fill clerical vacancies, he would acknowledge and welcome such an order to the Roman clergy as a token of Leo's readiness for peace, and would revise the laws which had been passed for the protection of the contested rights of the crown. The Pope's answer is dated January 30. After the usual introductory and complimentary remarks, he says that through Cardinal Jacobini he has sent a note to the Prussian Minister, Schloezer, which will more fully explain on what terms he has authorized the bishops to notify the Prussian Government of the appointment of new curés without waiting for a thorough revision of the clerical laws now in force in Prussia, but that he expects to see those severe measures mitigated which prevent the full and free exercise of clerical duties and the education of the clergy. Church as well as State must be in the position to imbue with its own spirit the persons whom it employs. The above changes the Pope considers a *conditio sine qua non* for the independent existence of the Church. As soon as an understanding on these points is effected, it will be easy to conclude a real and lasting peace.

While the Prussian Government ordered its Minister in Rome to ask for the publication of this letter, the *Moniteur de Rome* published it at full length. This fact is a direct proof that Leo considers his position as better and much more commanding than that of Emperor William. Before knowing the exact wording and contents of Jacobini's note, it is of course impossible to do full justice to the Pope's demands; but their scope can already now be fully appreciated. The Emperor demands the bishops' notification of the appointment of all priests; the Pope mentions only the curés, and leaves out all assistants, such as chaplains and vicars, who temporarily, for any length of time, may fill the curés' offices. Not satisfied with this condition, the Pope asks to have the priests educated in Roman Catholic seminaries independent of State control, and the unlimited exercise of any clerical duty by his priests for the salvation of souls. The Emperor voluntarily offers the revision of some of the Falk laws; the Pope insists on a thorough repeal of all that is essential in them.

If ever since 1880 it had been necessary to prove that Rome does not want a peace but a

triumph, and that she is as overbearing and haughty as in the palmiest days of her ascendancy, it would be shown by the very words of the Pope. While the Conservative press, for the purpose of concerting a reactionary policy with the Centre, tries to interpret them as harbingers of peace and friendship, every independent paper and man treats them as an insolence thrown in the face of the whole German nation. In other words, the Pope disdainfully rejects the Emperor's peaceful offers, and adds insult to injury. Here we have the fruits of Bismarck's policy, the miscarriage of his plans to beat the Liberals with the assistance of Conservatives and Ultramontanes. Will he now break off negotiations with Rome? This he must do if he be not prepared to go to Canossa and to disavow the Emperor's own words in his letter of December 22 last. The situation of Prussia, owing to the stubbornness of the Pope, is now so bad that further negotiations would look as if she were craving for peace. The Centre, by now turning once more against the Government, as if the Pope had been willing to bring the negotiations to a peaceful end, while Bismarck had failed to accept his advances, try to make the best of the present standstill in an amicable settlement. Bismarck, on the other hand, is too able a diplomatist not to know by this time that Rome can afford to wait, while he cannot afford to wait, and that his prospects are rather gloomy if he be not willing to sacrifice the intellectual and moral leadership of Prussia. In short, Germany has lost a battle when victory was near at hand. And who has caused this defeat? The same statesman who did more than any other living being to create the German Empire. †††

P. S.—On the point of mailing this letter, I see the Jacobini note just published in the morning papers. It is much worse than was anticipated, and the advances of the Pope are even smaller than represented by him. All Rome will do is to announce the *present* vacancies to the Prussian Government, and to submit to its objection to or rejection of the appointees. In return for this concession, Leo XIII. expects Prussia to revise all the so-called Falk laws; and if such thorough revision appears satisfactory to him, he will give his assent to a definite and permanent notification. This is rather sharp practice! The Minister of Public Worship announced to the Landtag that the Prussian answer would soon be published.

RICHARD WAGNER.

LEIPZIG, February 22, 1883.

THE shock felt throughout Germany at the news of Richard Wagner's death was the more severe from being, in general, totally unexpected. Even his bosom friend, Franz Liszt, one of the earliest and most devoted champions of the principles which Wagner defended with his pen and illustrated in the series of noble musical dramas now so widely known, was so completely overwhelmed by the suddenness of the blow that he fainted away, and was with difficulty restored to consciousness. Angelo Neumann, the director of the "Richard Wagner Theatre," received the news on the 14th, at Aachen, where the "Rheingold" was about to be given. The representation was followed by solemnities in honor of the dead master. Neumann, his voice choked with emotion, addressed the audience in the following heartfelt words:

"Not only the German people, the German nation—the whole world mourns to-day by the coffin of one of its greatest sons. All in this assembly share our grief and pain. But nevertheless we alone can fully measure the fearful loss which the Richard Wagner Theatre has met with through this event. The love and care of the master for this institution can find no better expression than in a letter, written by his own hand, received by me this evening, which closes with these words:

"'May all the blessings of Heaven follow you! My best greetings, which I beg you to distribute according to desert. Sincerely yours,

"'RICHARD WAGNER.

"'VENICE, PALAZZO VENDRAMIN, February 11, 1883.'

"Now we are orphaned—in the Master everything is as if dead for us! I can only add, we shall never cease to labor according to the wishes and the spirit of this great composer; never shall we forget the teachings which we were so happy as to receive from his lips and his pen."

Wagner had been unwell and under medical treatment since last autumn, although not confined to his bed. In order to assuage the asthmatic trouble which, during the "Parsifal" representation, assumed a threatening character, he had employed subcutaneous injections of morphine for years, with favorable results. Herr Levi, of the Royal Theatre at Munich, was for the week preceding Wagner's death a guest of the latter at the Palazzo Vendramin in Venice, and found him in good health and spirits, even enjoying the festivities of the Venice Carnival in company with his family and guests. On February 12 Wagner visited his banker Reitmeyer, and drew a sum of money to defray the expenses of a projected tour to Southern Italy with his son Siegfried. The morning of the 13th he passed as usual in the sacred retirement of his study, composing and playing. At 2 o'clock he appeared on the threshold, not, as was his wont, singing and beating time, but with feeble, tottering steps, and complaining that he felt very ill; these bad symptoms, however, soon passed off. At 3 the whole family was assembled at table, and soup was being served when Wagner suddenly rose, crying out: "Mir ist sehr schlecht!" (I am very sick), and fell back as if in a swoon. He was immediately carried to bed, and the attending physician, Dr. Keppler, hastily summoned. But it was too late; he could only say that Wagner had ceased to live, and that the immediate cause of his death was an attack of heart disease.

A death-mask was taken by the sculptor Benvenutti. The remains were embalmed and enclosed in a metallic coffin, which was transported to Bayreuth by a special train, consisting of a locomotive and tender decorated with black flags, a freight-car draped in black for the coffin, a parlor-coach for the family, and two other coaches for friends and servants. The funeral ceremonies at Bayreuth were simple and most impressive. Delegations from all the cities and theatres of note in Germany were present. At the beginning of the obsequies a military band played an arrangement of "Siegfried's Death"; speeches were then made, and a funeral song was sung by the Liederkranz of Bayreuth, after which the funeral train moved slowly, to the tolling of the bells, through the densely-thronged streets, in which the gas-lamps, veiled in crape, were burning, presenting a strange contrast to the bright daylight. It was the wish of the wife of the departed that the quiet of his last resting-place, chosen by himself years ago behind the villa "Wahnfried," should not be disturbed by a musical demonstration, and her feelings were respected. Three Protestant divines officiated; the solemn Lutheran funeral service was spoken; and the grave closed over the body of the greatest composer that the nineteenth century has produced. The myriad laurel wreaths, sent by private persons, corporations, theatres, and musical associations, including two magnificent ones from King Ludwig, Wagner's patron and friend, were not suffered to waste away upon the grave, but were collected in the Wagner Theatre at Bayreuth.

The public demonstrations on the news of Wagner's decease show that the event is felt to be of national, indeed of world-wide, importance. The press of nearly all European states, even the ultramontane press of Italy, is full of his praise, and of incidents and anecdotes connected with his life and death. In every city of any importance in Germany memorial concerts, consisting of Wagner's compositions, together with memorial exercises, have been and are still being held. I notice that the "Trauermarsch," from the "Götterdämmerung," appears most frequently on the programmes of such concerts, of which the proceeds are, in most cases, to be devoted in some manner to the purpose of perpetuating Wagner's memory. In various cities, among others Venice, Vienna, and Leipzig, the erection of suitable monuments is already projected. Neumann makes the proposal that a sum should be collected for the benefit of the bereaved wife and children. This proposition has occasioned lively opposition from various quarters, on the ground that the *tantièmes* from the performance of Wagner's works will afford a princely income; also that King Ludwig will undoubtedly settle a handsome pension on the wife and children of his deceased friend. Although Wagner's receipts from all sources were very considerable, he is said to have left almost nothing, his mode of life having been very luxurious, and his household numerous; the entire body of servants accompanied him on his frequent journeys. Another proposal is to found an institution for needy musicians; and yet another to unite all sums for the purpose of carrying on Wagner's cherished idea, a national school of dramatic and musical art, such as the theatre at Bayreuth, with its yearly gatherings of eminent artists from all parts of the empire. This last proposition is perhaps most consonant with Wagner's own wishes; but it is questionable if such a scheme can meet with success, now that the master spirit has passed away.

The never-resting energy which was Wagner's most prominent characteristic did not fail till the day of his death. According to the *Neue Freie Presse*, he was engaged in composing a new musical drama, entitled "Die Büsser," the poem of which, a glorifying of the transmigration of souls, is based upon the Brahminic legend, and was nearly finished; the musical composition of some parts was already begun. On the other hand, Filippo Filippi, an Italian admirer of Wagner's genius, writes to an Italian paper that the master was engaged upon "a new opera having an Hellenic subject," in which "it would undoubtedly have been shown that his genius, turning from the misty fables of the Germans to the bright and serene poetry of ancient Greece, would have drawn nearer to our musical life and feeling, which is clear and characteristically melodious."

Richard Wagner composed, like all great musicians, in his brain, and not, as is often imagined, at the piano. It is a delight to examine a manuscript composition from his hand—to see how complete and well-rounded, how ripe and finished everything sprung from his head. Changes are very rarely found in such a manuscript; even in the boldest harmonies and most difficult combinations, not a slip of the pen occurs. In the entire score of "Tannhäuser," which Wagner wrote out himself from beginning to end in chemical ink, not one correction is to be found. One note followed the other with easy rapidity. It was his habit to write the musical sketch in pencil—at Bayreuth, music-paper was to be found in every corner of "Wahnfried," on which, while wandering about the house during sleepless nights, musing and planning, he made brief jottings, often merely a new idea in instrumentation. The rest was in his head; the vocal parts were added to the score without hesitation, and never

needed correction. For the orchestra he employed three staves, one of which was reserved for special notes, as, for instance, when a particular instrument was to enter. From these sketches the vocal parts could be written out immediately, although the instrumentation was by no means finished. Such sketches were carefully collected by Frau Cosima, who tried for a time to fix the notes permanently by drawing the pen through them. This task was, however, soon abandoned. In its stead she grasped the idea of making a collection of all Wagner's manuscripts, to be deposited in "Wahnfried." For many years she has conducted an extended correspondence for the purpose of obtaining, for love or money, the scattered treasures, and has, in a great measure—principally through the use of the latter persuasive—succeeded.

In regard to the projected performances of "Parsifal" at Bayreuth during the coming summer no definite decision has yet been reached. The singers, in general the same as last year, have already signified their willingness, and also obtained permission, to coöperate in the representation of this season; a substantial pecuniary foundation is likewise not lacking. It is therefore by no means improbable that the performances may take their wonted course. (The latest intelligence is that the managing committee have decided in favor of holding the "Festspiele" this year.) Wagner had written his memoirs, which are not only finished, but already printed. The entire edition consists of *only three copies*, one of which was in the possession of the author, the second an heirloom of Siegfried's, and the third in the hands of Franz Liszt. This autobiography fills four volumes, and was printed at Basel, every proof-sheet being jealously destroyed, so that there are actually but three copies in existence. To the nine volumes of his works already published (Leipzig, E. W. Fritzsch, 1871–3) will be added a tenth, containing brief essays and sketches of a philosophical character, and (it is to be hoped) the four volumes of the autobiography.

Richard Wagner was born in Leipzig, in the Brühl; the house, number 88, called the Red and White Lion, is still standing, and bears the following simple inscription:

In diesem Hause
WURDE GEBOREN
RICHARD WAGNER
DEN 22. MAI, 1813.

A visit to the house reveals nothing of special interest except the room in which the great composer first saw the light of day—a long, low, narrow chamber, with one window toward the street; the interior arrangement has undergone a complete change. The present occupant of the flat, which takes up the whole third story of the house, said with no little pride, as I asked him if he were certain that this was the room: "Yes, yes, he told me so himself while on a visit to Leipzig with his wife; he came here with her to show her the rooms."

Wagner received his first instruction in counterpoint from Christian Gottlieb Müller, during his course in the Nicolai Gymnasium in Leipzig. He entered the University of Leipzig February 23, 1831, as *studiosus musicæ*. About the same time he began, as he himself writes, his first thorough course of contrapuntal study, under the direction of Theodor Weinlig, Cantor of the Thomasschule. "My course of study under Weinlig was finished in less than half a year," he writes; "he himself dismissed me from my apprenticeship, after having conducted me so far that I could solve the most difficult exercises in counterpoint with ease. 'That which you have gained through this dry study is called *independence*,' he said to me." And truly, independence in thought and deed has ever been one of Wagner's most striking and noble characteristics: in the storms of the political revolution of 1848, in the long years of exile following, and, what has secured him enduring fame, in the more peaceful revolution of dramatic musical art, for the accomplishment of which he labored with untiring energy. He lived to see his most daring hopes fulfilled; to see his enemies among his countrymen reduced to a mere handful of carping critics; to hear of the representation in foreign lands of those works of whose performance in Germany he almost despaired not many years ago. He lived to see the principles in which his whole life and soul were bound up victorious, and to feel himself the object of an unbounded love and admiration. The closing verses of the poem spoken at the memorial exercises in the Leipzig Theatre aptly illustrate the feelings with which the German people regarded this representative of German musical art:

"Er tilgte stark den hohlen Prunk und Schimmer,
Ein grosser Mann in einer Welt voll Kleinheit;
Er suchte nach dem Wahren, Echten immer,
Und statt des Stückwerks gab er uns die Einheit.
In Allem, trotz verschwenderischer Fülle,
Ein goldner Faden doch, der nie zerreisst!
Gewaltig wusste sein Titanenwille
In *neue* Form zu giessen *neuen* Geist.

"Wenn je sein Vaterland ein Deutscher liebte,
Hat er's geliebt mit Andacht und mit Thränen.
Wie auch sein Tag sich lichtete, sich trübte,
Du, deutsches Volk, warst alle Zeit sein Sehnen.
So lasst an seiner Gruft uns dies geloben:
Wir wollen jenen Schatz erhalten *rein*,
Den er in seiner Kunst für uns gehoben,
Und wollen *Deutsch* in seinem Sinne sein!"

Correspondence.

OREGON AND THE LOUISIANA PURCHASE.

To the Editor of The Nation:

Sir: Ever since it was my misfortune to publish the 'Statistical Atlas of the United States,' I have been made the object of reproachful letters through the mails, and of objurgatory notes and appendices in magazine articles and school histories, for having presumed to include the Territory, formerly known as Oregon, and now constituting the State of that name, together with the Territories of Washington and Idaho, as a part of the region acquired by the United States through the so-called Louisiana Purchase of 1803.

"The Oregon Question" was not one which there had ever been occasion for me specially to investigate; but for the purposes of the Atlas of 1874 it seemed right to include Oregon in the Louisiana Purchase, since the United States, through its ministers, Gallatin and Rush, had actually claimed it as carried by the force of the Treaty of 1803—if not through direct cession, then by a sort of political gravitation, as "contiguous unsettled territory," if I rightly remember Mr. Gallatin's phrase. Whether this claim was or was not valid under the terms of the treaty, according to accepted principles of international law, the fact that the United States had made the claim seemed to justify this treatment of the subject in an official publication like the 'Statistical Atlas.' But, as has been said, my critics have been relentless, and I have been subjected to so many lectures on the subject as to make me willing, out of pure weariness of soul and for the sake of peace, to confess that Oregon was discovered by Jason, settled by Dido, conquered by Tamerlane, and acquired by the United States at the peace of Westphalia, in the administration of James K. Polk. Indeed, I once sat down to write to the *Nation*, expressing my entire willingness to admit anything, and by turns everything, regarding the acquisition of Oregon, which any, and by turns every, person in the United States or elsewhere might wish to have admitted; my sincere regret that Oregon had ever been acquired, discovered, or created; and my complete retraction and recantation of the map and text relating to that baleful region which was contained in the offending publication. But the subject proved as soporific as Schleswig-Holstein, and I fell asleep over the paper.

And now comes my friend, Mr. Theodore Dwight, the learned and accomplished librarian of the State Department at Washington, and calls my attention to the map of the Louisiana Purchase, given by M. Barbé-Marbois, the negotiator, on the part of France, of the Treaty of 1803, in his 'Histoire de la Louisiane,' published in 1829. On this map, the entire region defined in the 'Statistical Atlas' as the Louisiana Purchase, extending clear across the Rocky Mountains to the Pacific, is printed in one uniform color, and enclosed within deep boundary lines, while across it, from southeast to northwest, from Lake Borgne to Puget Sound, runs the title:

"Accroissement des États-Unis par le traité et par ses effets."

Two subordinate legends, in smaller letters, occupy the two parts of this great field, which is divided, not by the Rocky Mountains, according to the views of my critics, but by the line of the 110th meridian. To the east and south is written:

"Suivant d'anciennes cartes, la Louisiane s'étendait jusqu'au 110° degré de longitude occidentale."

To the west and northwest is written:

"Territoires et pays occupés par les États-Unis *à la suite du traité de cession* de la Louisiane."

A man of temper might ask: If M. Barbé-Marbois didn't know the extent of that Louisiana which he kindly ceded, and the effect of that cession, who did? But the spirit of self-assertion has been too far broken within me by past suffering to allow me to adduce even M. Barbé-Marbois as authority on this subject, as against the self-constituted guardians of American history.

Francis A. Walker.

Boston, March 9, 1883.

THE NEW SHAKSPERE SOCIETY AND THE SOUTH.

To the Editor of The Nation:

Sir: It may be of interest to the readers of the *Nation* to quote a paragraph or two from the third annual report of the New Shakspere Society, which has just been sent out. A cheering word for the South, in view of so much recent painful criticism, will help the friends of both sides from falling into discouragement.

To the uninitiated, it may be stated that the great Old-English scholar and antiquary, F. J. Furnivall, was the founder of this Society, and that its president is Robert Browning.

The committee, in their report for 1881–2, page 11, say:

"The Society's prize books, unbound as they are, and of little money value as compared with their inner worth, continue their good work of stirring up Shakspere study all over the country, and in many parts of America, where they are eagerly sought for; . . . and from the United States, especially the Southern ones—which are striving to raise the standard of their education to the level of our own universities, and are devoting special attention to English—the committee have received most gratifying witness to the good which the Society's recognition of the American educators' efforts has effected. Every now and then this witness has come in the form of a letter from a professor or teacher who has said that he or she owed to the resolve to win the Old Country's prize his or her first real interest in the great poet whom he or she is now teaching to younger folk in class."

Eight Southern institutions, among the twelve in the United States that get the prizes, are then enumerated.—Respectfully yours,

JAMES A. HARRISON.

WASHINGTON AND LEE UNIV., LEXINGTON, VA., March 6, 1883.

CIVIL-SERVICE REFORM IN OHIO.

TO THE EDITOR OF THE NATION:

SIR: As an example of the uphill work the friends of civil-service reform have still before them, a recent removal and two appointments in this city afford food for reflection. The U. S. District Attorney, General Meyer, publicly opposed, during the last canvass, the regular nominee of the Republican party, on the ground that his nomination was obtained by corrupt use of money through the Machine. At the instance of the defeated candidate, and through the influence of Senator Sherman, General Meyer has been summarily removed and his place given to another, although his record as a public officer has, so far as we know, never been questioned.

The postmastership became vacant, and the assistant postmaster—a faithful officer who has been many years in the office—petitioned for the vacancy. His petition was endorsed by the civil-service reform club of this city. But, instead of carrying out the spirit of the reform bill, the President appointed a brother of Senator Jones, of Nevada, and it is now rumored in political circles that the daring subordinate who was so bold as to aspire to the reward of his years of faithful service is to be dismissed, that a place may be provided for the defeated Republican candidate for sheriff.

The only excuse the press gives for this plain violation of the spirit of the law is that the President had made positive pledges before the law was passed. But the spectacle of a Nevada Senator controlling appointments in Ohio is, to say the least, worthy of consideration as one of the legitimate results of "personal politics."

Very truly yours, L. B. TUCKERMAN.

UNIVERSITY OF WOOSTER, CLEVELAND, O., March 6, 1883.

PROHIBITION AND SOPHISTRY.

TO THE EDITOR OF THE NATION:

SIR: The sophistry of the arguments advanced in favor of the right of the State to prohibit the use of intoxicating liquors is ably demonstrated by Mr. Ernst Hofer, although, as he intended to prove the contrary, his success must be attributed rather to accident than to his wisdom. Mr. Hofer evidently thinks—for this is the ground on which he objects to your comparison between the prohibition of whiskey and the prohibition of potatoes—that the State has the right to forbid the sale, importation, or manufacture of luxurious articles, but not of those which are a necessity. If this were so, the State might forbid the use of diamonds or other expensive articles with the same right that it could prohibit the use of intoxicating drinks.

Again, the comparison which he draws between the mistake of Lord Palmerston and the error alleged to have been committed by yourself is more remarkable for the wide divergence of the things compared than for their similarity. There is a vast difference between *forbidding the sale, importation, or manufacture of an article*, and *merely levying a tax upon its sale, importation, or manufacture*. The constitutional basis of a tax is the raising of revenue; and so long as the law which imposes this tax discloses no illegality on its face, it is perfectly competent for a legislature to choose, in its discretion, what articles shall be subjected to taxation. In determining its choice, however, it is eminently wise and proper for the legislature to be guided by moral as well as economical considerations. It is this discretionary power, which is lodged in every legislative body, that justified Parliament in taxing gin and ale rather than treacle and vinegar, or which justifies Congress in taxing whiskey and tobacco rather than bread, meat, or other articles. But to forbid the sale or importation or manufacture of any article because it is a luxury, or even for the improvement of public morals, is not within legislative competency. SYLVAN DREY.

BALTIMORE, March 10, 1883.

TO THE EDITOR OF THE NATION:

SIR: Many Southern gentlemen have felt obliged, with whatever reluctance, to admit the truth of your statements regarding homicide at the South. So I, though mainly on the side of the abstainers, am obliged to admit that temperance advocates are liable to the mental twist you have referred to. There is an earnest teetotaler in this town, whose favorite temperance argument is as follows: If four glasses of rum will make a man drunk, a half glass will make him one-eighth drunk. It is absolutely impossible to be completely sober after drinking any rum at all. Knowing me to be a friend of "the cause," he mentioned his *argument* to me a while ago, doubtless intending to place an effective weapon in my hands. I said to him: "Is it possible that you do not see the fallacy of that? You might as well say that if a man is gluttonous who eats twenty-five ham sandwiches at a meal, he who eats one ham sandwich at a meal is one-twenty-fifth gluttonous. There is no such thing as moderation in the matter of eating sandwiches. Any man is either gluttonous or partially so who eats bread and ham together at all." "Oh," replied he, "that is sophistry, for ham and rum are very different things." And there he stuck.

He repeats his argument to me every now and again; but I never reply. Your specimens have driven you to the verge of despair, mine has plunged me in the very gulf. A chisel and hammer might suffice for yours, but a heavy charge of dynamite would be too inert for mine.

J. C. COZENS.

AMSTERDAM, N. Y., March 12, 1883.

HERMANN LOTZE.

TO THE EDITOR OF THE NATION:

SIR: No German philosopher is more read in America than Lotze, and yet little has been done to make his work known to those who are not special students of philosophy. Mr. Joseph Cook, the Boston lecturer, is one of the few who have attempted this, but Lotze would seem to have been wounded in the house of his friends. I am not very familiar with Mr. Cook's published lectures, but I have come across several passages which show that Lotze is misrepresented in a way that is painful to those of us who studied under him, and that must be evident to all acquainted with modern philosophy. As an example of this, take the peroration of a lecture entitled "Living Tissues," which reads as follows:

"If Hermann Lotze, the first philosopher of Germany, were on this platform to-day, he, in the name of the axiom that every change must have a sufficient cause, would thus and thus [tearing the paper] tear into shreds the materialistic or mechanical theory of the origin of living tissues and of the soul. [Applause.]"

Mr. Cook was peculiarly unfortunate in this sentence. Lotze does not believe in "the axiom that every change must have a sufficient cause," but he does believe in "the materialistic or mechanical theory of the origin of living tissues." Lotze thinks it necessary to disprove the assumption that every event has its cause in order to make freedom of the soul possible. In his 'Microcosmus' (vol. i., p. 292), he says that, if we mean whatever is effected is caused when we say every effect has its cause, we utter a mere truism; "but," he continues, "it is questionable whether we have a right to consider every event as an effect in this sense. The very endlessness of the series of causes and effects convinces us of the absence of this right, for it leads of necessity back to the recognition of an original being and an original motion." He goes on to say that the law should be stated, Every cause has its effect; rather than in the form, Every effect has its cause. Thus he leaves room for new causes and freedom of the soul.

Lotze's defence of the mechanism of organic bodies is fundamental to his whole system of philosophy. He was one of the first (in Wagner's 'Handbuch der Physiologie,' 1842) to take a stand against the then prevalent vitalism, and claim that all physiological processes can be explained under the laws of matter in motion. He says our body is only "the nearest piece of the outside world." There could be no more complete statement of "the materialistic or mechanical theory of the origin of living tissues" than this sentence:

"So far from finding in organic bodies a vital force sufficient for itself, we can far better look upon them as only those places in space at which the matter, the forces, and the motion of the general course of nature cross each other in such happy proportions, that changing masses unite themselves for a time to a quickly perishing form, and their reciprocal actions run through a melodiously complete process of development and dissolution" ('Microcosmus,' vol. i., p. 155).

I have written this to show that Lotze is unfortunate in being patronized by Mr. Cook, but more especially to urge some student to make public an account of the work of the great German philosopher. J. M. CATTELL.

JOHNS HOPKINS UNIVERSITY, BALTIMORE, MD., March 7, 1883.

Notes.

THE Messrs. Harper make a novel and well-considered offer to "Young American Artists," to the following effect: They will award three thousand dollars to the successful competitor in a contest for the best original drawing to illustrate Alfred Domett's "Christmas Hymn" (1837), provided (1) that he is an American artist not over twenty-five years of age; and (2) that he will use the prize "for the prosecution of art-study in one or more of the best American schools, including also a sojourn abroad of at least six months for the study of the old masters." The drawing must be presented anonymously not later than August 1, 1883, and must be suitable for publication in *Harper's Magazine*, for which it will be engraved. The judges will be Messrs. R. Swain Gifford, F. D. Millet, and Charles Parsons. All necessary particulars, and a copy of the hymn, can be obtained of Harper & Brothers, Franklin Square. There seems to be no discrimination as to sex.

'My Trivial Life and Misfortunes,' by "A Plain Woman," whose name is not known even to her publishers, will be issued in this country by G. P. Putnam's Sons simultaneously with the Edinburgh edition of the Messrs. Blackwood.

A volume of lectures, essays, and sermons by the late Rev. Samuel Johnson, author of 'Oriental Religions,' with a steel portrait and a memoir of Mr. Johnson, by the Rev. Samuel Longfellow, will shortly be published by Houghton, Mifflin & Co.

D. Appleton & Co. will publish immediately Dr. Morgan Dix's recent 'Lectures on the Calling of a Christian Woman, and her Training to Fulfil It.' They have also in press, for immediate publication, a wholly new and exhaustive edition of the 'Poetical Works of William Cullen Bryant,' containing a hundred or more never before collected or published, including some thirty hymns, and a companion piece to "Sella" and "The Little People of the Snow." Copious notes by Mr. Parke Godwin give various changes in the more important poems, an account of their origin, and other interesting information. The work will be issued in two large handsome volumes, uniform in style with Mr. Godwin's 'Biography of Bryant.'

D. Binswanger & Co., Baltimore, have nearly ready 'The Sciences among the Jews before and during the Middle Ages,' from the German of Dr. M. J. Schleiden, the eminent botanist.

Mr. Spofford's 'American Almanac' for the current year has appeared (American News Co.), and more need not be said to any one who knows the value of this standard work. Its being up to date is shown by the blank left where the late Marshall Jewell's name has heretofore stood in the list of the Republican National Committee. Next year we may expect the Civil-Service Commission to make its début in this Almanac.

A translation of Alphonse Daudet's 'L'Évangéliste' has already been brought out by T. B. Peterson & Bros., Philadelphia.

Joel A. Miner, Ann Arbor, Mich., sends us an 'Index Rerum' and a 'Medical Index,' handsomely got up and adapted to methodical or unmethodical use. The latter work is especially recommended by the publisher to homœopathic students or practitioners. The former, in the size before us, has a double alphabetic arrangement.

In the Parchment series of D. Appleton & Co. has appeared Keble's 'Christian Year,' with rubricated rules, initials, seasons, etc., and an etched portrait of the poet, after Richmond's drawing.

'Street's Indian and Colonial Mercantile Directory,' for 1882-3 (New York: S. M. Pettengill & Co.) is primarily compiled for British trade; but a considerable part, like Canada, the British West Indies, Panama, South America, China, and Japan, has a direct interest for our own merchants. Each country is statistically described, in all the particulars with which commerce is concerned—such as administration, steam communication, telegraph, banks, etc.—and under the principal towns are given classified lists of professions and trades; so that it is perfectly easy to obtain information or open business connections direct. Part II. consists of alphabetical but unclassified lists of shipping merchants, manufacturers, etc., in London, Bradford, Sheffield, Glasgow, Belfast, and other great industrial centres of the United Kingdom. A number of excellent maps accompany the volume, which is introduced by tables of weight, coinage, etc. The present, by the way, is the ninth issue of this Directory, of which the accuracy is guaranteed by the extensive colonial dealings of the Messrs. Street.

From J. W. Bouton we have Part 13 of Racinet's 'Costume Historique,' which, on account of the editor's illness, MM. Firmin-Didot have had to publish without the text. But this will be given in connection with Part 14, when there will be only six more to complete the work. The beautifully colored plates of Part 13 represent, in general, European costumes of the fifteenth and sixteenth centuries, the native costumes of India, Africa, Oceania, and, in particular, those of Sweden, which are very diversified and interesting. Besides these there is a grouping of antique *chaussure*, and other plates show a Spanish and a Turkish interior, and European furniture from the fifteenth to the seventeenth century. Ethnologically, these figures are of unequal value; it is so much easier to counterfeit clothes than physiognomies.

In Parts 51-55 of 'Brockhaus' Conversations-Lexikon' (New York: L. W. Schmidt) the letter C is well disposed of, and American names of persons and places now begin to appear somewhat more plentifully. The most notable omission is that of De Witt Clinton, who was a "bigger man" than, say, Thomas Corwin, and did more for his country with his canal than Henry Clay with his compromises. Can it be true, by the way, of any protectionist, that, as is said here of Clay, "he always addressed himself to the better impulses of the masses"? We should also have liked Gen. William Clarke remembered, if only incidentally as the namesake of Clarke's Fork, which is admitted. Roscoe Conkling might better have shared the oblivion of governor and explorer than to be set down as having lifted President Arthur out of obscurity and made him his tool, and controlled his administration for the degradation of American politics. The engravings for these issues are less numerous than common; but there is an excellent map of the northern and western half of South America.

We have received another volume of the Clarendon Press Series, one of those neat and convenient classical text-books of which we have several times spoken approvingly. The present volume consists of extracts from twenty-two dialogues of Plato, with a somewhat extended preface, a general introduction giving an interesting account of the manuscripts of Plato, and grammatical, exegetical, and critical notes. The Greek text occupies 223 pages of about the same size as those of the Teubner edition, but much more handsomely printed. The selection of the extracts was made under the advice and with the approval of the Rev. B. Jowett, perhaps the first of living English Platonists. The preface, explaining the object of the work, giving an outline of the character and labors of Socrates, and touching upon some of the more important points of the Platonic philosophy, is also from Mr. Jowett. The introductions and notes are entirely the work of Mr. John Purves, Fellow of Balliol College, Oxford, of which Mr. Jowett is Master. These introductions and notes are written with good judgment and good taste. The notes are free from a tantalizing fault to which the *Nation* has several times called attention—viz.: referring to passages not contained in the text of the book, but which it is necessary to consult in order to give the note any value. In all such cases Mr. Purves quotes the passage referred to, so that with a grammar and dictionary, which, of course, are always at hand, the student can go through the book without being obliged first to provide himself with a considerable library. We ought, perhaps, to remark that Mr. Jowett insists very earnestly that the book is not intended as an introduction to the Platonic philosophy. Its object is wholly literary. All metaphysical considerations have been, as far as possible, excluded. The extracts have been selected and the notes constructed solely with reference to the pleasure and profit of young men who are studying Greek, without regard to metaphysicians, whether incipient or mature.

L. Prang & Co. send us an assortment of their Easter cards in a great diversity of styles, some equally well adapted, with a change of legend, for Christmas or New Year's.

Not content with republishing old books with new titles, one publisher has gone further and issued a book with the first part so altered that a comparison of the beginning of the books would lead one to suppose they were different. The first three pages of the old issue have been compressed into one in the new issue, but from the second line of the second page of the new issue the books are printed from the same plates. The book is Mrs. Annie Edwards's 'The Ordeal for Wives,' published in 1873, and now issued as No. 8 of a "New Series" with the title 'Delicate Ground.'

Mr. Foster's February *Monthly Reference Lists* (New York: F. Leypoldt) has to do with "Indian Tribes in the United States" and "Gladstone," two sufficiently distinct topics for the bibliographer. We feel moved to remark again on the improvement in this useful serial which the publication of Poole's Index has made possible. The *Reference Lists*, in fact, is a partial filter and popularizer for the larger work. As we write, there is passing under the hammer in this city one of the notable private libraries of Providence, as to which Mr. Horatio Rogers, in his account of these libraries, said some years ago that there was much speculation about its ultimate destination. He intimated that it might be dedicated to public use in the city in which it was gathered; and we regret the circumstances, whatever they are, which have prevented its being added to the scanty collection which Mr. Foster presides over with so much intelligence and so great advantage to his fellow-citizens, and to all who profit by his *Reference Lists*.

A substantial "Reference List" for English fiction and juveniles in the Peoria (Ill.) Public Library has reached our table, the library being but two years old. This is, in other words, a special catalogue reduced to its lowest terms, most titles occupying but a single line; under authors' names their respective works are briefly grouped.

In the *Athenæum* for February 24, Mr. John W. Hales recalls these lines from Spenser's "Prosopopoia"—

> "Among the rest a good old woman was,
> Hight Mother Hubberd, who did farre surpas
> The rest in honest mirth that seem'd her well"—

and would fain connect her with the Old Mother Hubbard of the nursery song. 'Father Hubbard's Tales' turns up, he says, in 1604; but he has no faith in the reality of this personage. He suggests a connection between Mother Hubbard and St. Hubert, the patron saint of dogs.

In the February *Portfolio* (J. W. Bouton) Mr. Hamerton continues his fascinating papers on Paris, in which it is easy to foresee the making of a book. His archæological details concerning early Lutetia should greatly stimulate the curiosity of the modern tourist in Paris. The illustrations to these papers are highly interesting.

It seems that our novelists and historians are not alone in pleasing the fastidious Frenchman. Among the recent issues of Parisian publishers is 'Le Masque arraché, par de Witt (*sic*) Talmage, abrégé d'après l'anglais,' in two volumes, now in its second edition.

M. Jouaust announces a new "Bibliothèque artistique moderne," to contain the principal works of the chief modern authors, adorned with etchings by eminent artists. The *théâtre* of Alfred de Musset, illustrated by M. Louis Leloir, will be followed by Stendhal's 'Chartreuse de Parme,' the 'Contes' of Gautier and M. Daudet, and M. About's 'Roi des Montagnes.'

—In the last number of the *American Model Printer* a writer urges the getting-up of an American Exhibition of Printing in the broadest sense of the term; and we believe that the idea has been regarded favorably in Boston, which is already provided with fine permanent exhibition buildings. We doubt if it is fully realized, even by the reflecting, how little the diffusion of knowledge by the cheap press has served to popularize the details of the art of

printing, which is to vast numbers of intelligent people almost a black art, perhaps little better comprehended than the mode of producing a photograph. That the public would readily learn what it is now ignorant of, cannot be doubted, nor that an exhibition such as is proposed would in some of its branches be as beautiful as it would be instructive. In short, under the right auspices, the enterprise might be made both successful and memorable.

—The family of the late Thomas Crane, of this city, have consecrated his memory in the place of his nativity (Quincy, Mass.), by erecting a library building in truly elegant style, and making it over to the town for the free use of the public in perpetuity. The proceedings at the dedication of this Crane Memorial Hall have been recorded in a handsome pamphlet, illustrated with numerous photographs. There seems an anachronism in performances begun by masonic ceremonies and ending with an address by a grandson of John Quincy Adams, but Mr. C. F. Adams, jr.'s, discourse in the Stone Church had only a programme connection with what took place "at the other end of the avenue," as Thaddeus Stevens used to say. It is a model of fitness for the subject and the occasion, tracing the ancestry and career of Mr. Crane and the development of his character, with a true historical restoration of the Quincy of his boyhood, and some philosophizing on the New England spirit, at home and on its migrations. Mr. Adams's picture of New England intemperance before the great reformation begun in 1826 is not overdrawn; but is it quite "safe to say" that "of those who went out from New England to seek their fortunes, . . . rum ruined, body and soul, the vast majority"? So terrible a winnowing for the survival of the fittest makes the New England successes in colonizing the West seem almost miraculous, and would compel us to believe that the Yankee's accession to any community already started and developing was a calamity that must have become proverbial. Was not rather the toper and the predestined victim of the alcohol habit the stay-at-home; and were not moderation, self-control, and the enterprise of the pioneer more naturally found together? However, our chief reflection on laying down this address has been that foundations like this library—and they are multiplying daily—are paving the way for a reflux from the cities, by furnishing centres of culture and humanity, capable ere long of bringing every part of the rural districts within their beneficent influence. Why, for example, had one rather live in Boston than in Old Braintree, which, "now divided into four separate towns"—Quincy being one—reckons "four public libraries, three seminary endowments, and a church which preserve the memories of their founders," with fresh air and country sights thrown in?

—The *American Bookseller* urges the New York Free Library upon the consideration of benevolent millionaires. It must be very disagreeable to be a New York millionaire, and to be told that one "ought" to give a large slice of one's fortune to such objects, and that all that one's fellows have done as yet is but "throwing a bone to a hungry dog." However, it does not appear to trouble the millionaires. A year ago the *Critic*, if we remember right, urged Mr. Vanderbilt to give a million or so to this library. Possibly he does not see the *Critic*, as it is not a financial journal. At any rate, the funds are still less than a million, and it has taken five years for the number of books to have "swollen," as the *Bookseller* puts it, "to some five thousand volumes." Considering that this is less than half what Cincinnati, or Chicago, or Harvard College adds every year to libraries already large; that it is less than Cleveland or Milwaukee or Indianapolis adds in a single year, and looking at the relative size of these cities and New York, "swollen" is not exactly the word we should choose: it lacks local color. Yet with this miserably small stock in trade our library has satisfied seventy-two thousand calls for books in twelve months—a turnover, as the English say, of fifteen. With such good work as that, we have no fears for its ultimate success, but it must be confessed that prosperity is very slow in coming.

—The seventh volume of the Public Health Association Reports (Boston: Houghton, Mifflin & Co.) contains among its many papers relating to sanitary affairs three upon the curious and important subject of malaria. Of these, two describe the malarious invasion of New England. This means the recent and unusual manifestation of what medical men term marsh miasm. Malaria has come to represent, in current city phrase, a complex influence—resulting in whole or in part from sewer emanations, inadequate ventilation, and varied dissipations besides marsh miasm proper. As "what man calls lassitude the fox calls laziness," so the malaria of the fashionable drawing-room is often a domino for artificial evils, not the outcome of ordinary natural causes. The nature of the true malarial poison is still a secret—both as to its entity and its singular property of periodical expression. The weight of testimony points to its necessary association with vegetable decay in the presence of moisture, within a certain range of temperature—although there are a few apparent exceptions. But nothing has been demonstrated, and one of the ill effects of the strangulation by Congress of the National Board of Health is the suspension of a careful investigation into the essential nature of this evil agent that was in progress. The representations here are that in a territory where there is no record of its previous appearance recently, this form of disease has prevailed, gradually extending its area, during the last ten or fifteen years. It is unsafe to express opinions as to facts in the absence of personal investigation, especially in opposition to the views of those who have studied them at home. The "opinion that local causes are insufficient to account for its causation, that is, for its first appearance," is one that cannot be positively contradicted by a stranger, although it is in apparent opposition to common experience. One observer has not been able "to find any cause, or set of causes, that uniformly produce malaria, or any unsanitary conditions generally supposed to be productive of it that do not exist in other parts of [Connecticut] where no malaria has ever appeared." That is, to say the least, an astonishing state of affairs, and the group of questions it raises should be an interesting, because difficult and important, parcel of nuts for State sanitarians to crack. As the writer from Massachusetts remarks, the manufacturing interest, by virtue of its dependence upon mill-dams and ponds, is an important complication in the way of radical reform.

—Dr. Garnett, in the third paper, writing upon the Potomac marshes, holds that there is no marsh malaria as at present understood, and that the phenomena attributed to it result primarily from prolonged insolation, magnified by atmospheric humidity, affecting the organic nerve. Six or eight years ago an hypothesis was suggested that this poison was an imponderable force, generated by organic decomposition acting upon the sympathetic system. It is quite possible that malaria may be a force rather than a microscopic or otherwise visible body; but these subtler speculations as to its essence do not receive general favor. It seems tolerably certain that moisture is in some way connected with its creation, and that well-drained lands as a rule, other things being equal, are healthier than those that are not. It is a standing reproach to science that so little is certainly known about this cause, and to governments generally that such conditions as at least are believed to accompany its manifestations are tolerated in civilized communities. Among the other papers in this volume are several upon the diseases of domestic animals, especially as affecting the health of man. One is a report, continued from the previous year, by Dr. J. R. Smith, of the Army, upon the diseases of Texas cattle. This is still incomplete, but it points to the conclusion that Texas cattle are, as a rule, healthy in their native prairies, and that healthy herds do not, by their mere presence, communicate disease to herds in other localities with which they may mingle. Several observers on trichinæ concur in finding large areas of country exempt; that the parasite is associated with the food-supply of the hog, and that all pork should be properly inspected before sale, which can easily be done. This inspection, as Dr. Hunt justly observes, should be extended to all meat intended to be eaten. And there are some reasons for supposing that oleomargarine, of which we hear suspiciously little by its proper name, rendered at 120°, may shelter a supply of undesirable bacilli for consumption alive.

—"Adieu, canaux, canards, canailles," wrote Voltaire, on leaving Holland in a pet. If some of the inhabitants of the Hague had their way, M. Tallichet informs us in the *Bibliothèque Universelle*, the world might say, "Adieu, canaux," in regard at least to that part of Holland. The canals beautify the streets and cool the air, and give life to the rows of trees along their banks, whose leaves absorb the exhalations from the almost stagnant waters. But because the waters are so slow-moving—the rain and a little water pumped into them by the city furnishing the only current—and because they are made the drains of the city, they smell no better than the gutters of Philadelphia. Now, either the modern nose has become more sensitive, or the increase of population has brought the injection of sewage beyond the point at which the air over the canals and the leaves of the trees can oxydize it. Moreover, certain of the most offensive canals have been filled up, leaving, of course, less oxydizing surface to do a continually growing work. The inevitable result of such a course must be that all the canals will be filled in time and covered sewers substituted. M. Tallichet, however, opposes this. He would prefer the adoption of the Liernur system, which is in full and successful operation, at Leyden and Dort, and, after long opposition, has gained a foothold at Amsterdam. This system in brief has two peculiarities: first, that the surface water of the streets and the washing water of houses are removed in one set of pipes, and all fæcal matters in a separate set; and secondly, that fæcal matter is removed daily from the receptacles in which it accumulates, not as with us by water under a slight and ineffectual gravity pressure, but by air forced so powerfully by a pneumatic pump that it cleans out thoroughly the receptacles and pipes and never allows them to foul. The fæcal matter is not allowed to ferment and become dangerous, but, after a slight chemical treatment, is desiccated and reduced to a brown powder as harmless as guano and more fertilizing. It is not claimed that the sale of the products pays for the cost of manufacture, but there is no loss if public health is regarded as one of the products.

—In other respects, the Hague meets with praise from M. Tallichet. The gas is excellent, made from Australian coal, which is very dear,

but very rich in gas. The water is good. Like the riches of the country it comes from the sea. On the dunes pits are dug below the sea-level; the water percolates through the sand, leaving its salt behind it. It is pumped into large tanks, frequently cleaned, where it purifies itself by depositing any earthy matter which it may still have in solution. It is then pumped into a tower to give it sufficient head to reach the upper stories of the houses. It is said to be better than that of Amsterdam, obtained in the same way, probably because the sands are better. The Hague has grown rich of late, though it has neither manufactures nor commerce, and new suburbs of well-paved streets, with many detached houses and pleasant gardens, are extending out to Scheveningen. But what most excites M. Tallichet's enthusiasm is the wood on the east of the city—a real wood, not planted by man, but a relic of the original forest which once covered the whole of Holland. It owes its preservation, no doubt, to the royal palace which it contains. Would that there were a few royal palaces in this country! It is, by the way, not at first sight evident why there should be any Hague at all. It was originally only a princely hunting-box. It has no natural beauties except its forest. Whatever makes it attractive is the work of man. Why should man have expended labor upon it? He was not drawn there by commerce or manufactures. What was the attraction? The climate, says M. Tallichet. A porous soil absorbs the moisture; the warm waters of the Gulf Stream soften the winter; if the sea breezes are too boisterous, the dunes and their fringe of trees are a protection. Both Amsterdam and Antwerp, though they are ports, are in the interior, and do not get the full freshness of the sea air. The traveller who comes from either of them to the Hague feels exhilarated, as if he had climbed a mountain. This is just the place for the rich merchant who has made his fortune in the East Indies to retire to, and the absence of the bustle and worry and dirt and ugliness of business increases its attractions. The bathing, too, at the neighboring village of Scheveningen is unsurpassed in Europe: an immense beach of firm fine sand, no piers, no shipping, no drainage; room enough for the sexes to bathe apart, so that they can enjoy themselves with a minimum of clothing. It is to be hoped that it will not all be spoiled by the construction of an artificial port at Scheveningen and a canal thence to Rotterdam; as if there were not ports enough in Holland.

— Ernst Dohm, one of the most distinguished of German journalists, died in Berlin early in February, shortly before completing his sixty-fourth year. For thirty-four years he was the editor-in-chief of the *Kladderadatsch*, the German *Punch*, which was one of the products of the events of 1848, and has ever since maintained its leading position, its only rival in popularity being the *Fliegende Blätter*, which, however, eschews politics, the principal field of the *Kladderadatsch*. The training of a theologian is not generally supposed to favor sarcastic tendencies, but Dohm successfully accomplished the metamorphosis from a divinity student to a professional satirist in prose and verse. According to Paul Lindau, he was one of the first who recognized the importance of Bismarck at a time when professors of history and civil polity abused him as a "political dilettante." For this early championship the *Kladderadatsch* was ill requited by the later Chancellor, whose silly sensitiveness repeatedly caused him to inflict fines on the editor for an innocent little joke about him. There was one man, however, at whose expense Dohm would not allow any sort of joke to be inserted in his paper; and that man was Richard Wagner, of whom he was an enthusiastic admirer, although his translations of the librettos of "La Belle Hélène" and "La Fille de Mme. Angot"—excellent in their way—may seem to militate against this idea. Lindau says that his translation of Lafontaine's fables must be ranked with the masterpieces of Schlegel, Tieck, and Kleist. Of his own poetry but one collection has been reprinted, under the title of 'Ungereimte Wochenkroniken,' in which he has incorporated the political and social events of each week in the most marvellously flowing and easy lines, considering the heterogeneity of his material. In Berlin he was one of the social leaders, and nowhere could a more interesting company be found than at his house on the famous "Monday evenings." He leaves a wife and four daughters.

—Louise Michel glories in the name of *Pétroleuse*. Her friend, Élisée Reclus, can now boast of a grander epithet. Their common friend, Prince Krapotkin, has bestowed on him, out of prison, the awe-inspiring appellation *Dynamitophil*. And the French "geographer and dynamitophil," thus addressed in a letter by his Russian admirer, makes an appeal to the public for contributions of scientific books to the prison library at Lyons, "that the world may not be deprived of the fruits of the imprisoned Nihilist's active brain." A similar request was addressed many years ago by Russian scientists to the Government of the Czar in favor of the same brain, then as now kept in prison for plotting the overthrow of the state and the inauguration of general anarchy. The fact is stated in "Stepniak's" 'Russia Sotteranea' (Milan, 1882), which adds that Krapotkin was, in consequence of the petition, allowed to continue, in the Fortress of Peter and Paul, the geological studies which he had pursued in Siberia, and which he subsequently utilized "come collaboratore del signor Élisée Reclus." Thus the two scholars have long been united by the double bond of geologiophilism and anarchiophilism. The 'Russia Sotteranea' has a string of interesting remarks on the Russian conspirator, in the light of which he appears much less redoubtable as a worker for the destruction of the present order of things in the universe than the official organs of the French Republic have deemed him to be. He is depicted as an ardent, eloquent, and impassioned agitator, but as too frank and truth-loving, too exclusive and rigid in his theoretical convictions, too uncompromising in their application, to be "the chief or even the organizer of a party whose only means of action is conspiracy." "In the revolutionary struggle, conspiracy is what guerilla warfare is in a military contest. . . . *His* natural element is the grand war."

—There was a time when German and English concert societies devoted most of their energies to the works of Mendelssohn. In England, it is true, Handel was always held in still higher esteem, but Mendelssohn exercised such an immense influence that the compositions of most English musicians were little more than echoes of his melodies and harmonies. Such a one-sided hero-worship was sure to be followed by a reaction, and there has been accordingly a temporary abatement of the excitement over his works. But there is so much that is charming and savoring of true genius in them that this reaction could not last long either. How great an interest is still felt in his oratorios in this country was shown on the 7th inst., when a very large audience collected to hear "Elijah." The Oratorio Society was at its best, and gave a really magnificent performance of the work. The chorus was large, certain in rhythm and intonation, careful in shading, and everybody sang with so much zest and enthusiasm that the audience could not but express their enjoyment in frequent outbursts of applause. The last chorus of the first part was the best choral singing heard in this city since the Handel night at the May music festival. The orchestra, which has an easier but less attractive and important part to play than in more modern works of its class, was also quite satisfactory. Almost unlimited praise can be given to the soloists. Miss Winant rarely fails to give complete satisfaction, and she was in one of her best moods. Moreover, Mme. Gabriella Boëma displayed a richness of timbre, a dramatic power, and an impressive delivery which were not so noticeable on the occasion of her previous appearances in this city. Mr. Max Heinrich, too, astonished his greatest admirers, whose expectations were not small to begin with. The absolute purity of intonation in the unaccompanied concerted pieces was a remarkable phenomenon, grateful to the ear. Dr. Damrosch wisely omitted several numbers, especially in the last part. Even thus the performance lasted almost three hours. The oratorio is a mistaken form of art in any case, and anything above two hours becomes a bore, however well it may be executed. The music-drama is the art work of the future—in Germany already of the present.

—Richard Wagner was, during the last ten years of his life, an honorary member of the New York Philharmonic Society. This fact gave especial significance to the memorial concert which took place at the Academy of Music on Saturday evening. All the regular habitués of the Philharmonic concerts attended as a matter of course; and besides these there were so many occasional visitors that the hall was crowded as perhaps at no previous concert. The programme was admirably adapted for the occasion; and Mr. Thomas may regard as a compliment to his good taste the announcement, just received, that at the Wagner Memorial Concert given by the Vienna Philharmonic Society, the same pieces were played, with one exception. In both cities Beethoven's "Eroica" was given, besides Wagner's "Faust Ouverture" and "Siegfried's Tod," from "Die Götterdämmerung." The fourth piece in Vienna was a composition by Bach, while Mr. Thomas more appropriately chose *Wotan's* touching farewell scene from "Die Walküre," the vocal part being allotted to Mr. Remmertz. Wagner himself was so fond of the "Eroica," or Third Symphony, with which Beethoven "first entered his own peculiar sphere," that he wrote a short analysis of it, in which he cautions the hearer against expecting anything having reference to a military hero. Man himself, with all his aspirations and passions, is the "hero" to whom this music relates. A Viennese critic aptly suggested, many years ago, that "pathetic" would be a more apt title for this symphony than "heroic," as its prevailing tint is one of pathetic tenderness and resignation. All this pathetic tenderness, with the alternating grandeur, was revealed in a magic light by the marvellous playing of the one hundred and twenty chosen musicians under Mr. Thomas's sympathetic direction. The same was true of the Wagner selections, which perhaps should have constituted the second instead of the first part of the programme. The arrangement adopted, however, allowed the two famous funeral marches to be separated by only one other movement. It is said that Wagner used to refer to a grand funeral march which he had composed expressly for his own obsequies, but which he was unwilling to rehearse for fear of hurting his wife's feelings. It is to be hoped that this is not a mere rumor, and that the suddenness of

his death alone prevented him from giving this piece to the world last month. In any case, it can hardly be a more sublime work than the symphony which accompanies the bearing of *Siegfried's* body across the moonlit hill, and which embodies all the principal motives of that hero's life, just as a panorama of his existence is said to pass through a drowning man's mind. As regards the first piece on the programme, "Eine Faust Ouverture," it may be news to many that Wagner intended it originally as the first movement of a symphony which was never finished. It was written in Paris at a very early period of his life, before the second act even of "Rienzi" had been composed, and before he had become fully conscious that the dramatic stage was to be his exclusive sphere. It is somewhat vague in its ideas, but already contains some of those instrumental devices which were developed into such unprecedented orchestral splendors in his music-dramas.

—Gounod's "Faust" was given at the Academy of Music on Monday evening, before a vast audience and with an uncommonly strong cast. Signor Ravelli's voice was very fresh and resonant, and if his stature and histrionic gifts had been of the same excellence, his *Faust* would have been an altogether satisfactory performance. Signor Galassi gave due prominence to the few good points in the rôle of *Valentine*, while M. Durat, often vainly, struggled with the important rôle of *Mephisto*. In the hands of Mme. Scalchi, whose position as a New York favorite is now assured, *Siebel* became quite a prominent figure in the plot and music. This excellent singer has already received so much praise on previous occasions that iteration is not necessary; but an occasional slight imperfection in phrasing must not be passed over: she does not always give a dotted note or a pause its precise value, and sometimes sings a little too independently of the orchestra, although the deviation is so inconsiderable that few will notice it. Mme. Albani was the *Marguerite*, and it goes without saying that she is much better in this part than Mme. Patti. She endeavors, in attire, bearing, and facial expression, to reproduce the simple, naïve, unhappy maiden of Goethe's poem, and there are many beautiful touches in her impersonation, while her voice is equally good in passages that require agility and in those that call for emotional expression. Like Mme. Scalchi, she was warmly applauded, especially after the Jewel Song. It was a matter of painful surprise that she should have consented to transfer the impressive and weird church scene to the street instead of having it inside the church, where it belongs. In this way the finest scene in the opera is completely ruined, for nothing could be more absurd than the situation as given here, with the young girl unbosoming her grief in the middle of the street, and a scarlet clown frisking about her and singing into her ears, as a substitute for the ghostly, invisible voice of her own conscience. "Faust," as written by Gounod, and played all the world over, has never given offence to the religious people of France and Germany, and we do not believe that the popular sentiment in this country is in favor of such vandalism in art.

BLUNT'S REFORMATION OF THE CHURCH OF ENGLAND.

The Reformation of the Church of England. By J. H. Blunt. Vol. ii. (1547–1662). E. & J. B. Young & Co.

AFTER some years of delay the second and final volume of Mr. Blunt's 'History of the English Reformation' makes its appearance. It furnishes a very good example of diligent and conscientious scholarship, guided and influenced throughout by a strong partisan tendency. Mr. Blunt is an Anglican through and through. Every form of foreign influence upon the fortunes of the English Church is hateful in his eyes. For him the episcopal succession is a sacred thing, only to be approached with bated breath and with the use of hallowed technicalities. There is no crisis in his narrative of so great historical moment as that caused by the resignation of bishops at the death of Queen Mary; and the accident of nominations having been made in time to prevent a break in the episcopal succession rises to the dignity of a Providential interposition.

It will be easily believed, then, that, in spite of his Anglicanism, there is a soft spot in Mr. Blunt's heart for all leanings toward Rome. The Papal supremacy was an atrocious doctrine, to be sure, but justifiable in the eyes of its supporters by a long tradition and as a practical working force for many generations past. As one reads the narrative of this phase of the Reformation, the assertion of the Royal as against the Papal supremacy, one cannot help praising the author's calm, judicial point of view. We find here no passion or prejudice. Even the most violent leaders of the Marian faction get a full, rather over-full, measure of consideration. "Bloody Bonner" himself appears, upon really sound documentary evidence, so far as this goes, as a much-maligned and harshly-judged person, quite a model of Christian benevolence, in fact. He did all he could to save the accused from the last extremity of punishment, and acted only as his position of diocesan bishop compelled him to act. Such devotion to pure historic truth in opposition to received but ill-founded tradition can only excite our admiration.

But it is singular to observe how utterly this tone changes the moment our Anglican author has to deal with foes of another kind. Papal supremacy was effectually disposed of, but English (or, as Mr. Blunt would insist, Genevan) Puritanism began to raise its head and threaten the Church as founded upon episcopal succession. In these enemies was wanting all which had made the former opposition respectable. They had no tradition, had played no commanding part in the world's history; they were, on the contrary, supporters of irreverence for all consecrated things excepting the Bible, and had for their "spiritual lineage" only a line of sectaries, heretics, followers of strange doctrine, who had been a thorn in the side of the orthodox church for at least five centuries. Kathari, Patarini, Waldenses, Albigenses, Bulgares, Poplicani, and a host of other opprobious names, marked, at least to Anglican minds, the "spiritual ancestry" of the men who under Elizabeth began to attack the whole episcopal system. And here our author's judicial fairness quite deserts him. His pages fairly bristle with invective. Whatever was true and weighty in the Puritan theories escapes his notice. No one can deny the rudeness and violence of these early Gospellers. It is plain that their revolt was inspired by crude and material conceptions, the result of the misdirected and overstrained logic of Geneva; but with all and under all this was a great promise of liberty and light. The right of private judgment, with all its imposing consequences, lay in germ within these early protests. But all that is simply an abomination to Mr. Blunt. His vision is bounded by the æsthetic considerations of damage to altar-screens, images, and what not, which marked the Puritan spirit. His analysis of the Puritan doctrine is, like all his writing, clear and accurate. One could hardly ask for a better definition of Puritanism, in its anti-sacramental character, than is given here in a couple of pages; yet we think it would be a hard task for Mr. Blunt to prove that "these anti-sacramental principles . . . were originally derived from the Manichæan sects which aggregated so mysteriously in Southern Europe in the Middle Ages." The opposition to the Eucharistic Sacrifice (the capitals are his) seems to him "the most painful characteristic" of the Puritan movement. We submit that "pain" is not a proper sensation for an historian of religious opinions. Indeed, Mr. Blunt's feelings make the reading of these chapters somewhat "painful" for the reader. He almost weeps over the destruction of altars, finding no excuse for it, as he had done for the burning of Protestants, in the "spirit of the times." His state of mind may be conceived from the phrase—"the worship of the congregation, which the Puritans succeeded in so generally substituting for the worship of God in English churches." In other words, the great moral effort of English Puritanism—an effort whose need Mr. Blunt recognizes—is as nothing to him in comparison with the atrocious doctrine of the right of the congregation to elect its own clergyman with reference solely to his ability and worthiness to perform the ministerial functions.

When dealing with the question of Papal supremacy, it was not a matter to stir Mr. Blunt very deeply that England was overrun with a mass of foreigners, in the pay of a great foreign power, in a combined effort to overthrow the independence of the English Church. But now, when it is a question of Puritanism, it becomes a frightful evil that foreign Presbyterians should be striving, with purely spiritual means, to win Englishmen to their ways of thinking. This, then, is the almost fatal limitation of the book. It is High Church throughout, going as far as its English character will permit on the way to Rome. But for this limitation, it would have been a very valuable contribution to knowledge. The style is beautifully clear and simple, the arrangement judicious, the power of telling statement decidedly marked. Bearing in mind the partisan leaning of the author, one might safely make use of large parts of his book without fear of receiving a too-distorted picture of the time. Especially noteworthy is the power of subordinating detail to main effects. An author who can dismiss in a foot-note so tempting a subject for digression as the execution of Lady Jane Gray, is capable of very much in the way of reserve. The political events of the time are touched upon very lightly; only enough mention of them is made to connect them fairly with the movement of events in the Church. In so far as this is possible, the changes of Church policy are illustrated by original documents. Even the partisanship is so well concealed in some portions that one would not be troubled by it.

THE SITE OF PARADISE.

Wo lag das Paradies? Eine biblisch-assyriologische Studie. Mit zahlreichen assyriologischen Beiträgen zur biblischen Länder- und Völkerkunde und einer Karte Babyloniens. Von Dr. Friedrich Delitzsch, Professor der Assyriologie an der Universität Leipzig. Leipzig. 1881.

WHERE lay Adam and Eve's Paradise? or, Where is the Garden of Eden? was during former ages a question of profound religious curiosity. Where did the legends of the Hebrews place the first abode of man? is in our days still a question of considerable interest among Biblical critics. To the one and the other most diverse answers have been rendered by scholars. The difficulty consists in identifying two of the four streams (or "rivers") into which, according to the story of Genesis (ii. 8–14), was parted the

stream that came out of Eden to water the garden. There is no dispute concerning the two named last: they are the Tigris (in Hebrew, Hiddekel) and Euphrates; but where is the Pison, which compasses the whole land of Havilah, where excellent gold is found, and also bdellium and the *shōham*-stone? And where is the Gihon, which compasses the whole land of Cush? Our author examines one after another the solutions propounded by the various commentators, and states his own, with an array of learning which, in the old field of Biblical inquiry, shows him a worthy disciple of his father, Franz Delitzsch, and in the new domain of Assyriology a compeer of Oppert, Schrader, and other famous students. It is needless to follow him here in his survey, in which he has been preceded by so many expounders of Genesis, or in his refutations, which are not novel either; but we may be allowed, for the sake of such of our readers as are not familiar with this curious chapter of laborious exegesis and fanciful speculation, to convey an idea of the maze of conflicting opinions by an abridged statement of a recent German commentator:

"The exegetical views respecting the passage divide themselves into the historical, the allegorical, and the mythical. The historical views, again, fall into two classes: those that maintain the possibility of yet determining the region of Paradise, and such as suppose the configuration of the earth to have been so changed by the flood that the place of union of the four rivers cannot now be pointed out. . . . Calvin, Huetius, Bochart, and others:—Paradise lay in the district in which the Euphrates and Tigris unite; the Pison and the Gihon are the two principal mouths of the Shat-al-Arab. . . . Hopkinson:—Paradise was the region of Babylon; the two canals of the Euphrates form half the number of the four rivers. . . . Harduin:—In Galilee. . . . Hasse:—Paradise lay in East Prussia. . . . Clericus and others:—Paradise lay in Syria. . . . The mythico-theological, or strictly mythological, view makes it the story of the four world-rivers that come from the hills of heaven and wander over the earth. . . . According to the historical view of Reland and Calmet, Pison denotes the Phasis, which rises in the Moschian mountains, is connected with the gold-land of Colchis so famed in antiquity (Colchis = Havilah), and flows into the Black Sea; Gihon is the Aras, or Araxes, which likewise rises in Armenia, and flows into the Caspian Sea; Cush is the land of the Cossæans, which Strabo and Diodorus place in the neighborhood of Media and the Caspian Sea. According to this, Armenia would be the territory of the ancient Paradise. . . . Finally, according to [Franz] Delitzsch, the Pison must refer to the Indus, and its river territory to India, while the Gihon is the Nile."

To complete the picture, let us add that the first stream, Pison, has been identified not only with the Phasis and the Indus, but also with the Nile, the Blue Nile, the Ganges, the Hyphasis, the Hydaspes, the Araxes, the Chrysorrhoas, the Besynga of Further India, the Danube, etc.; and that among the various identifications of the Gihon there is also this, *Gihon = Oceanus*—linguistically thus explained by the late Tayler Lewis: ὁ Γι-ὸν—ὁ Γεων—ὁ Κεων—ὁ Κεαν—Ω-κεαν-ος, or, the Gihon, the Kehan, the Kean, the Ocean-river. Prof. Friedrich Delitzsch's critical speculations—which, as to the main point, are a restatement, with important modifications, of the old view of J. Hopkinson, in his *Descriptio Paradisi* (1594)—carry us back to the land and language of Babylonia. Everything in the earliest history of mankind, as told in the first chapters of Genesis, points toward that country. Noah's ark was uplifted on the first day of the deluge: the land where it was built must have been a lowland, argues our author. No allusion is made to vast expanses traversed by the ark before it reached Mount Ararat: the lowland must, therefore, have been at no great distance from eastern Armenia; Babylonia is a lowland thus situated. Postdiluvian mankind builds its world-tower on the plain of Babylonia. Eden itself is distinctly connected with the Tigris and Euphrates, rivers stated to have flowed out of it. That well-watered garden-land cannot have been in Assyria, for there the Tigris and Euphrates could not be imagined issuing from it as branches of one stream: it must be sought in the Babylonian plain. This plain, bordered by the Tigris and Euphrates, has, it is true, no room for two other rivers; but must we, asks Prof. Delitzsch, following Hopkinson, recognize in the Pison and Gihon two streams resembling in character the Tigris and Euphrates? Is not the word *nāhār* (which the Authorized Version renders by *river*) used in Hebrew, as it is in Arabic and Babylonian, also of canals? Is not the *nāhār* Chebar, on the banks of which Ezekiel saw his vision, clearly and repeatedly stated to have been "in the land of the Chaldeans"—that is, in Babylonia—and not in Mesopotamia, where it has been erroneously sought? The cuneiform inscriptions have lists of *nārāti*, or streams, placing canals side by side with the Tigris and Euphrates. The parting of the stream of Paradise into several branches obviously refers to irrigation.

But here a difficulty arises: Should canals constructed by the hand of man have entered into the description of Paradise, prepared for an abode of the first of the species? Prof. Delitzsch, who has very little reverence for the legend he treats of, and believes it to be derived from a Babylonian source, has no hesitation in discarding this objection. There was hardly any difference perceptible, he thinks, between the two great rivers and the canals of Babylonia. The canals were broad and navigable like the rivers, gave like these rise to other smaller water courses, and were of so exceedingly ancient an origin that the narrator could, without committing a flagrant anachronism, connect them with the very planting of the divine garden. Arrian, in describing the Pallacopas canal, found it necessary to remark that it was an artificial channel, and not a river derived from springs. Moreover, it is certain that a part of the Babylonian canals are not of originally artificial construction, but ancient river beds or branches of the Euphrates and Tigris, converted into navigable or irrigating channels when those two rivers had carved out their permanent beds. The canals Pison and Gihon may have been known as such branches of the main streams.

Now, where lay the lands Havilah and Cush, around which those water-courses wound? Havilah, answers Delitzsch, is the east-north-easterly portion of the Syrian Desert, bordering on the lower Euphrates, a tract of which is designated by the Arabs as Ard-el-Halat, land of dunes. The Hebrew name (*ʻhăvīlāh, or ha-ʻhăvīlāh*, the sandy, from *ʻhōl*, sand) has the same meaning. Gold is proved by cuneiform inscriptions to have been a product of the adjoining territory of Bit-Yakin, northeast of the mouth of the Euphrates. Bdellium, according to the testimony of Pliny, was a native product of Babylonia. The stone shoham is the *sāmtu* (fem. of *sāmu*) of the inscriptions, a famous mineral product of Meluha, a Babylonian district rich in precious stones. Thus everything connected with Havilah leads us back to the vicinity of the lower Euphrates. The Cush of the story of Paradise is surely not the African Cush, Cush in the narrower sense, or Ethiopia. It is the land of the Kaššu of the inscriptions, who had separated from their kindred in the mountain ranges north of Susiana, the Cossæans of the classical writers, and established themselves as rulers of central Babylonia—a people, perhaps, identical with the Casdim, or Chaldeans, of the Scriptures. The Pison of Havilah is the Pallacopas of the Greeks (*pallaco* = Heb. *peleg*, Ass. *palgu*, canal), that great canal west of the Euphrates, extending from the neighborhood of Babylonia to far below the present mouth of the river in the Persian Gulf, of which Ritter surmised that it presented the most ancient and most direct bed of the great stream, in its eastward-trending course to the gulf. The stream compassing the land of Cush is the canal Shat en-Nil, forming an opposite curve east of the Euphrates to that of the Pallacopas on the west, and identical with the Arahtu of the Assyrian inscriptions, mentioned as *nār* (river or canal) immediately after the Tigris and Euphrates, and also designated by a non-Semitic name which can be deciphered as Guhana—that is, Gihon.

Thus the four water courses into which the stream of Eden was parted on coming out of it were the Pallacopas, the Shat en-Nil, and the lower Euphrates and Tigris, the former three branching off from the middle Euphrates near Babylon, and the Tigris communicating with it through a network of canals and little channels. The middle Euphrates is the main river, watering with its numberless branches the country around and north of Babylon, which is Eden. The Euphrates alone waters it, for the Tigris, flowing through a lower bed, only receives water, and imparts none, through the connecting channels. The character of this country, as described by Herodotus, Xenophon, Strabo, and Ammianus Marcellinus, was in antiquity such as fully to deserve the appellation bestowed upon it. It was charming beyond comparison by its luxuriant vegetation, variety of excellent products, and marvellous cultivation. The Babylonians and Assyrians called it Kar-Duniaš, grove of the God Duniaš, in the non-Semitic equivalent of which name the syllable *Kar* is replaced by *Gin*, corresponding to the Hebrew *gan* in *gan ēden*, garden of Eden. The most ancient non-Semitic name of the city and district of Babylon was Tintira, meaning grove of life, which reminds one of the tree of life in the narrative of Genesis. The Hebrew word *ēden*, delight, may, in this combination, be a phonetic imitation of the non-Semitic *ēdin* of the inscriptions, which means plain.

Unfortunately for the theory so powerfully advanced, almost all the linguistic evidences by which it is supported are still of doubtful value, the etymology of the Babylonian names in most cases, and the reading in some, being disputed by high authorities in this obscure field of inquiry. Were the linguistic points proved, it would be hard to resist the power of the argument, in spite of various difficulties arising from the scanty text of Genesis itself. As it is, although all other solutions of the knotty Biblical problem may be subject to still graver objections, the following questions militate too strongly against Prof. Delitzsch's solution: Why, if the stream of Eden be the middle Euphrates, is it left unnamed in the narrative, though it is certain that the Hebrews were perfectly familiar both with the middle and the upper course of that river? Why, if the Pison and Gihon designate the canals Pallacopas and Shat en-Nil, are they said to *compass* lands which the canals only traverse? If the *lower* Tigris be meant by the Hiddekel, why is this river described as flowing in front of Assyria, which lay *above* the central Mesopotamian lowland asserted to be Eden? How should a writer familiar with the whole course of the Tigris deem its lower part a branch of the Euphrates? Why should Cush, a name which commonly designated Ethiopia, have been used by the narrator in a sense in which it nowhere else occurs in the Scriptures, without the least further definition? Why, on the other hand, is Havilah, if the Ara-

bian borderland so well known to the Hebrews be meant, so fully described by its products? Who tells us that the gold, the bdellium, and the shoham of Babylonia were also characteristic of the adjoining Havilah? But whether these objections, in the present stage of Assyriological studies, be fatal to the theory of Prof. Delitzsch or not, we have no hesitation in saying that his dissertation, amplified as it is by supplementary treatises on the ancient geography and ethnology of the Mesopotamian and neighboring countries, of Canaan, Egypt, and Elam, is a perfect treasury of knowledge—made most accessible by excellent indexes—and probably the most brilliant production in all Biblico-Assyriological literature.

Figures of the Past. From the Leaves of Old Journals. By Josiah Quincy (Class of 1821, Harvard College). Boston: Roberts Bros. 1883.

A VETERAN who can count up thirty public dinners over which he has presided must surely have some qualifications for reminiscent discourse of a delightful kind. Such was the late Josiah Quincy, who belonged to a family distinguished for wit, breeding, carriage, independence, and humanity, and who, in his own manner and degree, exhibited all these traits—on the one hand lacking the lofty eloquence of that stanch Federalist his father and namesake; and in satire yielding the palm to his younger brother Edmund, and perhaps not greatly surpassing him in post-prandial facility. The charm of this volume—a collected series of articles contributed chiefly to the *Independent*—consists in the happy style of the narrator, at once easy, humorous, and polished. Its interest is personal and historical, for the most part confined to the second and third decades of the present century.

The longest and most important chapters relate to the last years of John Adams, the reception of Lafayette in Boston and vicinity in 1824 (with the episodical account, from Colonel Huger's own lips, of his attempt to free the prisoner of Olmütz), the visit of the Duke of Saxe-Weimar, President Jackson's Eastern tour in 1833, an interview with Joe Smith at Nauvoo, and Washington society in the Presidency of John Quincy Adams. But of these we shall say nothing here except that young Quincy was singularly fortunate in being thrown either familiarly or officially with all the great men described, and to notice the fact that bestowing the doctor's degree on Jackson by Harvard College (with President Quincy at its head) was as bitter a pill as the approaching sacrifice to Governor Butler. Mr. Quincy himself compares the two events, deeming the one as inevitable as the other, yet quoting J. Q. Adams's "bitter generalization" in his diary, that "time-serving and sycophancy are the qualities of all learned and scientific institutions."

Mr. Quincy's description of his early school and college life offers many provocations to make extracts. There is the tutor at Andover who really believes he has put the boy in danger of perdition by presenting the dreadful alternative—"There will now be a prayer-meeting: those who wish to lie down in everlasting burning may go; the rest will stay"; for young Quincy does not stay. Harvard College is shown us at a time when fifteen was the average age of admission—not the minimum—and even so the habits of students led to open and general exhibitions of drunkenness. Emerson was the greatest but not the most promising of Mr. Quincy's classmates. Another, the Edward Kent for whom Maine afterward "went hell-bent" for Governor, is made the hero of the tradition that a member of the Lazy Club excused himself from running on the ground that he had been pushed and was too lazy to stop. On his way to Washington Mr. Quincy was companion and even nurse to Judge Story, whom he represents as given to monopolizing the talk at table, and to reciting his own poetry in stage-coaches, and from whom he quotes sentiments as to the equality and capacity of the female mind which we advise our friends the woman suffragists to keep standing in their journals. At the capital, Randolph made a great impression on the youthful Bostonian. John Adams, it seems, had a small opinion of Patrick Henry's eloquence (as had Jefferson, with regard to its solid content). Mr. Quincy put a leading question to Randolph intended to draw out his view on the subject. This is what he got (p. 212), followed by an immediate defence of the slave system against the mild anti-slavery sentiment of that early day (1826):

"'The greatest orator I ever heard,' said Randolph, 'was a woman. She was a slave. She was a mother, and her rostrum was the auction-block.' He then rose and imitated with thrilling pathos the tones with which this woman had appealed to the sympathy and justice of the by-standers, and finally the indignation with which she denounced them. 'There was eloquence!' he said. 'I have heard no *man* speak like that. It was overpowering.'"

Hezekiah Niles testifies to having heard Randolph point some highly indelicate allusion by turning to the ladies in the gallery of the House. Mr. Quincy enables us to appreciate the flagrancy of this indecorum by reminding us that "the gallery of the old House of Representatives was, in fact, not a gallery at all, it being simply a platform, raised a foot or two above the floor of the hall, which gave the honorable members an excellent opportunity of attending to the ladies who had come to listen to them." He does not remark, however, that besides the stimulus thus given to the orator by the nearness of his auditors, the petty size of the hall itself and the comparatively small number of his colleagues made Congressional oratory a very different thing from what it is now. On the one hand, the speaker could do his best with ease; on the other, the impressiveness of his effort on the listener would be greatly heightened by close contact. Both these considerations should be kept in mind in reading contemporary accounts of great debates.

We cannot begin to enumerate all these "figures of the past" whom the author has himself since joined. We must hurry past Charles Carroll, one of the "signers," opening the front door for his junior and departing guest, with the exclamation (he was in his ninetieth year): "Exertion! Why, what do you take me for? I have ridden sixteen miles on horseback this morning, and am good for as much this afternoon if there is any occasion for it"—a Palmerstonian endurance. Nor can Commodore Stockton detain us with his duels at Gibraltar and elsewhere; nor the Otises and Sullivans of the Boston of fifty years ago; nor Emily Marshall, the belle of Boston; nor her sister belles in other States, dancing with this handsome young aide-de-camp; nor Fanny Wright, nor Hannah Adams, here made the author of the proverbial female traveller's shibboleth: "Great box, little box, bandbox!" We must take leave also of the Nantucket whalers, living forty miles distant from the main of North America, and never having set foot on it, though they had visited South America and the Pacific Islands.

Mr Quincy intimates that his heirs have been enjoined from publishing the diaries from which, with legitimate embellishment of the record, these pages have been derived. Doubtless this is wise for his literary reputation, though Bostonians would take endless satisfaction in having the originals made accessible in print. All the more the historical significance and utility of this abstract should have been emphasized by a very full index. That which is given is meagre and faulty. The popularity of the book will justify the outlay of more pains, intelligence, and money upon this essential portion of it in another edition.

Practical Life and the Study of Man. By J. Wilson, Ph.D. Newark, N. Y.: J. Wilson & Son. 1882.

THE object of this work, the author informs us, is "neither to amaze nor to amuse" the reader, but "to interest and instruct those who are seeking improvement." It has not been hastily written, for he has "purposely waited till a late period of life, past fifty years," in order that, "with practical experience and a matured judgment, he might speak with confidence as well as intelligence upon a subject of such grave and lasting importance." He frankly admits that the title of the book is, commercially, "unfortunate," and that, in order to make it sell well, it ought to have been called 'Scandals in High Life,' or 'Experience of a Detective,' or 'Success Without Effort,' or 'Adventures of Captain Kidd,' or 'Money-Making Made Easy,' or 'Fun, Frolic, and Fashion.' But this is plainly ironical, for the contents of the book show that such titles would not be indicative of its real character; and, as Mr. Wilson is a moralist, to have resorted to any such device for the mere purpose of increasing the sale, would have been a fraud upon the public, that must have been damaging to a work of authority.

Mr. Wilson's book covers much the same field that such writers as Bacon, Epictetus, and Montaigne have hitherto occupied, but his range is far wider than all of them put together, and, notwithstanding a modest disclaimer in his preface, he is a much more original moralist than any of the three. It is impossible to give any idea of his method as an essayist without extracts, and we therefore turn at once to a chapter of his work devoted to a subject which has, we venture to say, often furnished food for reflection, and yet has never before, so far as we are aware, attracted the attention of moralists—"Large Men"! What is the view that the moralist or the philosopher ought to take of Large Men? "We have," says Mr. Wilson, "a wholesome regard for large men; for it often happens that large men are great men—nay, they are sometimes good men"; and, consequently, by the law of association, we infer greatness and goodness from size. It follows from this that "we have a contempt for diminutive men," and therefore it does not surprise us to find that small men "may do or say smart things, but they are never solid, never stable." And yet, as Mr. Wilson justly observes, "there are exceptions to all rules: some very large men have been very thick-headed, and some very small men have achieved mighty things." Thus far the analysis is complete; but Mr. Wilson now takes a step which for a less experienced thinker would be fraught with peril. He changes the meaning of the word "large," and insists that it should not be limited to mere size, but should also include the idea of strength. "The size of men should not, in estimating their power, be estimated by feet and inches. Men may not appear large, and yet be physically strong; men may not be very tall or very corpulent, and yet be very powerful. Napoleon was a small man, if we consider his height and weight, and yet he was well-knit, well-built,

and really strong physically, as he was mentally." Mr. Wilson apparently has in mind here the use of "big," in common parlance, as a synonym for strong or great—as in the well-known political phrase, "a biger man than old Grant"; but it seems going rather far to insist that "large" should be used in the same way. At any rate, there is no deception practised upon the reader. He says what he means, and there is nothing tortuous or underhanded in his dealing with the subject. The conclusion shows how he avoids extremes. He has expressed his preference for large men, and he has explained that mere size is not, after all, the true criterion; and finally we reach the truth that, after all, "the middle-sized men have done the heavy jobs of this world." It is they who "are emphatically working men, while our two hundred and fifty or three hundred pounders have a lazy, lumbering way that generally makes a man a little too late for the train, or perhaps finds him entirely unprepared for the work set before him"—truths which explain at once the deep irony veiled in the professedly laudatory description, "a good man, weighing three hundred pounds."

Another subject wholly neglected by the moralists we have mentioned, but not by Mr. Wilson, is that of "Advertising." On this we find some very sound remarks at page 122. "No business," says Mr. Wilson, "can prosper to any great extent in this country unless it is advertised. . . . People must make a noise, or they will not be heard. In fact, noise has a great deal to do with success in this world." He concludes this essay by a very original comparison of advertising to thunder, which "may not be capable of doing the least damage," and yet "leaves a much stronger and more lasting impression than lightning itself."

A large part of Mr. Wilson's book is a contribution to what Mr. Mallock calls the Science of Character. He does not, to be sure, know, any more than Herbert Spencer does, that there is such a science, but, like Herbert Spencer, he is always on the verge of discovering it. The chapter on the "Motives of Men" Mr. Mallock would find very interesting reading. Where in the new science, for instance, will be placed the case of "the man who would not drown himself for fear of being eaten by sharks"? In this chapter occur some remarks on Friendship, which will bear quoting, because they enforce a truth which Epictetus overlooked, and Bacon, if we remember right, refused to admit. It seems to be derived by Mr. Wilson from observation. If you want a friend, he says, the way to get one is to go to a man frankly and say to him: "If you will help us to this place, or help us to attain this object, we will divide the spoils with you, or you will make so much out of it, or we will pay you so much for your work." There is, says Mr. Wilson, "no resisting such appeals. Then we have a friend in truth—one that will stand by us, one that will be always on time, that will never desert us, never betray us (unless he can see where he can make more money elsewhere). We urge, again, that the only safe, reliable friends, after all, are those *who have a direct interest in helping us.* We are sorry to say that other friends, as a general rule (there are some exceptions), are not to be trusted out of sight." Mr. Wilson is not usually sarcastic, but the absurdity of the current ideas about disinterested friendship leads him to observe, in conclusion, that if there are, as some persons imagine, people in the world good-hearted and generous enough to help others along from the mere love of the thing, "it has been our misfortune never to meet with any such generous people. If such a race ever did exist, it is now certainly extinct, with the exception, perhaps, of a few stray individuals that have kept themselves out of reach of civilized man."

"The Impracticable" is the subject of another essay, which is a good example of the author's powers of leading from general propositions of undoubted truth to matters of immediate practical interest. Few people will deny, when their attention is once called to it, that it is very common "even for intelligent and cultivated adults to talk and act like children," or that many people have "an uncontrollable appetite for the impracticable, the impossible, the incredible," or that "they want to do things, simply because they know they cannot be done." But it is not every moralist who would be able or have the courage to lead us at once from these premises to the reflection that it is the love of the impracticable that leads to the spending of millions every year in the search for "a worthless or impossible North Pole," or that this is what explained the continuance of the search for the lost Charley Ross, "long after he was known to have been dead."

On the whole, Mr. Wilson's method as a moralist is altogether novel. His work will be found full of interest not only by those who have never given morals a thought, but by those, too, who are most familiar with the previous labors of mankind in the same field.

W. M. Hunt's Talks on Art. Second Series. Compiled by Helen M. Knowlton. Boston: Houghton, Mifflin & Co. 1883.

When Mr. Hunt began his work of teaching in Boston, American art—and especially that of Boston—was in a more feeble condition than it is now, and there was little opportunity for a beginner to learn the elements of drawing and painting, and the principles of design, in a rational and useful way. Indeed, there was scarcely a teacher in the country whose own training had been sound and thorough enough to qualify him properly for his work. Mr. Hunt, fresh from the inspiration of the vigorous modern French school of art, very naturally felt the inadequacy, the weakness, and the falseness of the greater part of the ideas and the practice which then prevailed here; and he applied himself to the task of giving what he considered, and what to a great extent really was, better instruction, with characteristic energy and enthusiasm.

He had been one of the pioneer American students who sought instruction in the French school, and the principles and methods which he had acquired there doubtless contained a much-needed antidote for many of the shortcomings and fallacies which then existed. The effect of his teaching was, therefore, in some respects good. What our art and art students had chiefly lacked was a just conception of the totality of a subject; they lacked discrimination in regard to the essential and the non-essential, and the habit of seizing the dominant characteristics of life and movement in organic form. Mr. Hunt's system directed attention to these broad and salient qualities at once. It discouraged triviality of premature minutiæ and all lifeless and mechanical elaboration of form. In this it was sound and salutary. But the system had its own defects, which impaired its usefulness, and in consequence of which it has, on the whole, done as much, perhaps, to harm public taste as it has to correct some errors.

A system of art-teaching, to be wholly and permanently useful, must enforce the equal importance of all the fundamental principles of design; it must fully appreciate them all, and cultivate them in just relationship to each other. This Mr. Hunt's system did not by any means do. It was partial and one-sided: it encouraged the pupil to observe the most marked characteristics of his subject, but it did not direct his attention to those refinements of line, color, and gradation upon which the essential beauty of both nature and art depend—it rather ignored these characteristics. It inculcated a prematurely bold and impetuous rather than a cautious and tranquil habit of work. While insisting upon so-called "values," it entirely failed to instruct the student in regard to those subtle compromises by which art, if it would avoid extravagance and untruth, is obliged to deal with the overwhelming strength of light and dark in nature. Mr. Hunt himself never appeared to see that the attainment of values, as he understood them, is incompatible with the balanced development of the three elements of painting—delineation, color, and chiaroscuro. Largeness of conception and simplicity of aim and method—which Mr. Hunt appreciated—are important habits of mind for a student of painting, and he cannot form these habits too early; but the inattention to functional details and the coarseness of workmanship which characterized the work done by his pupils, are by no means necessary accompaniments of them. They are, on the contrary, wholly incompatible with right conception of good painting. The idea of breadth, as Mr. Hunt taught it, was inadequate and harmful, because it omitted and ignored the idea of essential details as a necessary part of it. Nor did Mr. Hunt inculcate this idea as a temporary concession to the inability of beginners to grasp the whole while regarding details: it was practically inculcated as a final and sufficient one.

This second series of "Talks" is substantially like the first, and is thoroughly characteristic. It abounds in pithy remarks, which often contain a great deal of good sense, and sometimes give expression to noble sentiments—as where, on page 10, he says: "Don't try to paint better than any one else! Try to have other people paint better than you." Again, on page 25—on having read a severe criticism on his own work—he says: "Perhaps the best way to answer it would be to paint better than ever." Along with more or less of good advice, we constantly meet with much that is distinctly the contrary when addressed, as these remarks were, to beginners. For instance, on page 9 we find this: "Do your own work in your own way"; on page 29: "Trust to your feelings. Don't try to match tints"; and on page 49: "Do nothing that you cannot do cheerfully, easily." A beginner in languages or music is not often advised by a wise instructor to do his work in his own way, and he ought not any more to be advised to do so in drawing. As a beginner, his sole object should be to endeavor to acquire *right* ways of work; and while acquiring the means of expression, it is improper that he should trust his own feelings, or that he should not strive to match tints. As for the precept, to do nothing that he cannot do cheerfully and easily, it strikes the key-note of Mr. Hunt's weakness as a teacher: his pupils seem rarely to have troubled themselves to do anything that would cost pains. The fact, as we apprehend it, is that before a beginner can do anything good cheerfully and easily, he must make up his mind to do many things that will be more or less irksome and difficult. This, certainly, is the price of any worthy attainment in art, no less than in other departments of knowledge. In some passages where Mr. Hunt alludes to views which conflict with his own, he is at once arrogant, discourteous, and undignified. In short, the book, taken as a whole, notwithstanding that it contains some good things, is so confused, incoherent, and involved with fallacies, that we do not think a body of consistent and serviceable teaching can be extracted from

it. It is oddly printed, though in clear type—reading lengthwise instead of across the page—and is very awkward to hold in consequence.

The Promus of Formularies and Elegancies (being Private Notes, *circ.* 1594, hitherto unpublished). By Francis Bacon. Illustrated and elucidated by passages from Shakespeare. By Mrs. Henry Pott. With Preface by E. A. Abbott, D.D., Head Master of the City of London School. Boston: Houghton, Mifflin & Co. 1883.

ANY new book written to prove that Bacon wrote Shakspere is likely to excite quite as much curiosity as to the condition of the author's mind as about the proofs brought forward. Though we know little or nothing about Shakspere's life, we know a great deal about Bacon's. We know what were his occupations, his turn of mind, his interests, his style both in prose and poetry, what were his acknowledged literary productions; and all these put together make us as sure that he did not write the plays which go by the name of Shakspere as we are that Queen Elizabeth or Coke did not. Nothing short of a miraculous interposition of divine power would have enabled Bacon to do anything of the kind. A belief in the theory of the Baconian origin of the plays can only be explained by insanity, or by a perverted use of the rules of evidence, internal or external, applying to the matter. Carlyle, whose system of criticism was simple and thoroughgoing, explained Miss Bacon's adhesion to the delusion at once by declaring it to be clear that she was "mad"; but no such account can be given either of the learned Judge Holmes, who only a few years ago produced a volume to prove that Bacon was the author of the plays, or of Mrs. Pott, who now comes forward with her "newly discovered evidence." Judge Holmes was an able lawyer, and a recognized authority on the subject of evidence, but no one could read his book without seeing that it was only by disregarding all the canons shown by experience to be necessary in testing questions of fact that he made out his case. The evidence he brought forward as conclusive he would in court have refused to let a jury even consider. He professed to be governed by the rules of evidence on which, if we remember right, he had been just before lecturing, but it was really by resorting to new rules devised for the occasion that he accomplished his task. It was extraordinary that a lawyer, with a reputation to lose, should have done so, but such was the fact.

With Mrs. Pott the explanation is simpler. She knows what the rules of evidence are, and the method she has adopted would, if successfully applied, enable her to prove the Baconian authorship of the plays. The trouble with Mrs. Pott is that she labors under a delusion on the subject of the facts to which she applies her rules of evidence.

To show what her system of proof is, a few specimens will suffice. The 'Promus' was a commonplace book of Bacon, in which, with that love of all sorts of knowledge that characterized him through life, he jotted down proverbs, forms of expression, and phrases which he met with in reading as novel, or for any other reason noteworthy. Of course these include a great many expressions open to use by any one to whom the literature of the day was accessible, and open to Shakspere among others. Mrs. Pott takes an expression found in the 'Promus,' and then puts down all the passages from Shakspere in which not merely the passage, but anything like the passage, or remotely suggesting the passage, occurs, and points triumphantly to the coincidence. We will give a few illustrations of her process, taken at random. Entry No. 1,145 of the 'Promus' is *Lex talionis*. Mrs. Pott finds what she calls an "illustration" of this in "The Merchant of Venice," and quotes *Shylock*: "The villainy you teach me I will execute, and it shall go hard, but I will better the instruction." No. 1,146 is: "You are not for this world." Mrs. Pott finds this reproduced in "Coriolanus" (iii. 2), "His nature is too noble for this world"; in "Timon of Athens" (iv. 3), "I am sick of this false world"; and in "The Merchant of Venice" (i. 1),

> "You have too much respect upon the world;
> They lose it that do buy it with much care."

Entry No. 89 is, "A stone without foyle." Mrs. Pott finds that Bacon, when he wrote "Richard III.," made use of the idea contained in this expression in describing England as "this precious stone set in the silver sea"; and also in the following: "The jewel best enamelled will lose its beauty" ("Comedy of Errors," ii. 1); in "My love to thee is without crack or flaw" ("Love's Labour's Lost," v. 2); in "He is the very brooch, the gem of the nation" ("Hamlet," iv. 7); and in "A gem of women" ("Antony and Cleopatra," iii. 2).

These are fair samples of the kind of "parallelism" between the 'Promus' and the plays which Mrs. Pott makes the basis of her case. Of course, there are better ones, as there might be in the case of any two contemporaneous authors. Dr. Abbott, who writes a preface to say that he considers the work of interest as throwing new light on the style both of Bacon and Shakspere, but disclaims all belief in the author's theory, gives us what he considers one of the most striking coincidences. Entries Nos. 1,207 and 1,215 are, respectively, "Golden sleepe" and "Uprouse. You are upp"—the intermediate entries relating to early rising. Now, we find in "Romeo and Juliet" (ii. 3):

> "But when unbruised youth, with unstuffed brain,
> Doth couch his limbs, then *golden sleepe* doth reign;
> Therefore thy earliness doth me assure
> Thou art *up-roused* by some distemperature."

The author argues from this that Bacon must have written "Romeo and Juliet." Dr. Abbott thinks that the explanation may possibly be that Bacon had seen the play, had been struck with the expressions, and jotted them down in his commonplace book. But this is a real piece of evidence compared with most of Mrs. Pott's efforts. In most cases, such as those we have cited above, what strikes us chiefly is the misplaced ingenuity which has enabled her to find any resemblance whatever. She would have us believe, if we understand her, that she has searched through the entire body of English literature of the Elizabethan period, and cannot find the 'Promus' expressions or ideas anywhere except in Shakspere, to any appreciable extent. We would undertake to find parallelisms as striking as hers between the 'Promus' and almost any given book of the period, for the simple reason that nine-tenths of them are not parallelisms at all. To search through the thousands of volumes which Mrs. Pott declares she has examined for the negative branch of her case would be, as it must have been with her, a labor of many years; and to make it necessary for anybody to verify what Mrs. Pott says on this subject, there must be some plausibility about the positive side of it. The fatal facility with which she finds 'Promus' entries where no one else can see a trace of them, destroys our interest in her labors.

John Greenleaf Whittier: His Life, Genius, and Writings. By W. Sloane Kennedy. Boston: S. E. Cassino. 1882.

THE reviewer may well be slow in noticing a premature book like the one before us. Seventy-five years have not, as might be inferred from the title-page, closed nature's account with the poet; his faculties are not impaired; his producing power is not at an end. Everything points, in his case, to a decent waiting till he has passed from the scene, before the biographer and the critic begin their work of recording and judging. Mr. Kennedy brings no exceptional qualifications to his task. His personal intimacy with Mr. Whittier has apparently not been superior to that of the newspaper interviewer; he has not been diligent or painstaking in revising his facts, and is guilty of several capital errors as to dates; his narrative is very unskilfully put together; his analysis of Mr. Whittier's poetic gift is neither striking nor suggestive. This analysis constitutes the second part of the book, and of course abounds in illustrative quotations, the poems being taken up seriatim and in groups. One whole class is entirely neglected as a class, and has but one or two of its representatives mentioned incidentally. We mean such characteristic and, in the main, such beautiful and elevated poems as those preserving the traits of Mr. Whittier's contemporaries—the Calhoun, Webster, Silas Wright, Garrison, Follen, Channing, Shipley, Pierpont, Leggett, Storrs, Torrey, Neall, of the earlier period; the Sumner, John Brown, Fremont, Cheever, Stearns, Joseph Sturge, of the later. Add to these the kindred verses on the poet's private losses, not a few of which have become household, although Mr. Kennedy dismisses them with the slighting remark: "One cannot embalm the memory of all one's friends in verse." A chapter is devoted to the vexed question of the historical fidelity of "The King's Missive," but the discussion is quite inadequate.

Mr. Kennedy shows (p. 277)—and it is, perhaps, the most interesting original statement in the book, after the indication of a common ancestry for Webster and Whittier—that as many as twenty-two of Whittier's poems do duty as hymns in one collection; two other Unitarian collections have seven each, and Mr. Beecher's "Plymouth Collection" has eleven. The total number in use may thus exceed twenty-two. A bibliography of Mr. Whittier's works in prose and verse, up to date, and a good index, conclude this volume in a worthy manner. We will call the publisher's attention to a fatal typographical blunder on page 102, where Mr. Whittier is represented as giving "six reasons why the African Colonization Society's schemes were *worthy* of good men's support." The context requires "unworthy," which was, of course, intended by the writer.

Ice-Pack and Tundra. By W. H. Gilder. Charles Scribner's Sons. 1883. Royal 8vo, 365 pp., maps and illustrations.

THIS volume shows a decided advance, both in mode of presentation and substance of matter, over the 'Schwatka's Search' of the same author, notwithstanding the fact that the latter referred to a region much less known and intrinsically more interesting, while the present volume relates to events which have been for months in the fullest blaze of publicity, and the scene of which was a region more thoroughly known to the reading public than Mexico. We are happy to believe that this difference is chiefly due to the author's personal supervision, unfortunately not practicable in the previous case. Something may also be credited to the more serious nature of the later expedition, as compared with the Morrison crusade after logbooks and bones.

Mr. Gilder's letters from the *Rodgers* and from Siberia have appeared in the *Herald*, and here—pruned, rearranged, and supplemented with some excellent illustrations—are presented

in permanent form. It is strictly a personal narrative, except such portions as are devoted to De Long's journal, the heroic journey of Ninderman and Noros, and the later movements of Melville in the delta of the Lena. No book is without permanent value which contains these records of endurance, fidelity, and courage. It must be said for Mr. Gilder that his selections from the available material in regard to the *Jeannette* party appear to have been made with excellent taste and judgment. The personality of the writer is nowhere obtruded, and incidents which might have jarred the reader in perusal are sensibly ignored altogether. Some characteristic sketches of dwellers in northeast Siberia will be welcome to ethnologists, though the text seems barren of novelties in this direction, or, in fact, in any direction. To those who derive their first notions of life in east Siberia from this book, it will prove a tolerably full and essentially accurate guide in all generalities.

Of that part of the *Rodgers's* cruise relating to the exploration of Wrangell Land, previous to going into winter quarters, little has been made public. In a "Hydrographic Notice," issued by the Navy Department, are contained such data on Wrangell Land as the authorities saw fit to extract from the reports of Lieut. Berry and Captain Hooper, of the revenue steamer *Corwin*. This notice contains two maps, which differ in a marked manner from one another, and from the sketches in Mr. Gilder's narrative. The island in the latter seems to have been laid down without correcting for the variation of the compass, so that it is shifted about 20° in azimuth. In the enlarged sketch the conventional ripple-marks are carried around the base of the high land with a total disregard of the gravelly levels which form about one-half the area of the island, according to the Naval chart; and the ship's track appears to be carried about twelve miles too far north. However, if certain remarks in the text are accurate, it would seem as if Mr. Gilder's sketch, in respect of the relative position of Herald Island and the outlines of the eastern shore, was more accurate than that issued by the Navy. To Mr. Gilder, also, we are indebted for information as to the character, duration, and results of the magnetic observations at Rodgers's Harbor, which the Navy has not yet supplied officially. In view of these discrepancies, it would seem desirable that a reformed chart, or the data upon which the present one was constructed, should be published by the Department for the use of geographers, and that the new chart should contain, besides the local names given by the Naval officers, those previously applied by, or in honor of, the earlier explorers, Long and Hooper, which on the existing map have mysteriously vanished.

Whist; or, Bumblepuppy. Ten Lectures addressed to Children. By Pembridge. From the second London edition. Boston: Roberts Brothers. 1883.

WHIST PLAYERS of all grades will be both instructed and amused by this witty and sparkling description, and sharp contrast, of sound and unsound methods of play. According to the author's definition, "Bumblepuppy is persisting to play whist, either in utter ignorance of all its known principles, or in defiance of them, or both"; and he remarks that "between the worst whist and the best bumblepuppy it is almost impossible to draw the line." "Pembridge" teaches the "best whist." In discussing the lead, the plays of the second, third, and fourth hands, and the various exigencies of the game, he enunciates the soundest principles with clearness and incisiveness, occasionally interjecting descriptions of the bumblepuppian methods with a droll air of resignation. He does not, however, confine his good-humored satire to bumblepuppy, but keenly and effectively criticises some of the ultra "scientific" practices. On the whole, we know of no work containing in such small compass so much correct information upon the game of whist. In his epilogue, the author thus comically anticipates a possible criticism of his performance:

"Some readers of these lectures have complained that it is often difficult to discriminate when they are serious and when they 'attempted to be funny'; and have suggested that the attempts should be indicated clearly by a note—thus ☞ this is a goak!—and the remainder printed in red ink. While fully recognizing their difficulty, and sympathizing with them, I am unable to entertain either proposition. The first is an American innovation utterly at variance with the conservative character of the work; and it is a fatal objection to the other, that if whatever is important were picked out in red, many well-disposed children would at once rush to the natural, but highly erroneous, conclusion that they had got hold of a Prayer Book."

The Story of a Shell. Robert Carter & Bros. 1882. 8vo, 265 pp.

BOOK-LOVERS have not failed to observe of late the influx of a multitude of cheap, prettily bound volumes, which on inspection prove to be of English origin. Too often the interior belies the cover, either in its trashy quality or in the evidence the pages offer of being the product of worn-out stereotypes, long discarded in their native land. Rarely, we confess, but still occasionally, one finds a book among these emigrants which combines good printing and paper with contents not unworthy of attention. Of this character is the little work of the Rev. J. R. Macduff, addressed to boys and girls, and printed at the Ballantyne Press. It is an attempt to initiate the young into the mysteries of ocean-life by means of a story in which dreams serve the purpose of the fairies of a past epoch. It is well illustrated, and its natural history is accurate as far as it goes, though the literary machinery is rather cumbrous, and the style somewhat stilted. The small number of books of this class which, out of the many printed, can be conscientiously recommended for young people, impels us to bespeak for this one a kindly, if not an enthusiastic, welcome.

American Hero Myths. By Daniel G. Brinton, M.D. Philadelphia: H. C. Watts & Co. 1882. —*Brinton's Library of Aboriginal American Literature.* No. 1. The Maya Chronicles. Philadelphia. 1882.

MR. BRINTON'S career as a laborer in the province of early American history will soon approach its twenty-fifth anniversary. In reviewing his latest publications, it is but just that we should recall the various addresses, pamphlets, and books which embody the fruits of his long study. The subjects he chose cannot be said to be very popular. They treat of the migrations, myths, and linguistics of faded or fading away American tribes—of the mound-builders, the Codex Troano, the Landa Alphabet, Religious Sentiment and Names of the Gods in the Kiche Myths, and so on. Abstruse as these subjects are, they will never help to bring any writer into prominence, nor can Dr. Brinton flatter himself that he has enriched history with any important revelation. Laying down his book on the 'American Hero Myths,' we ask, What substantial gain is made by reaching the conclusion that the great prehistoric civilizers Viracocha, Pachacamac, and Quetzalcohuatl had, in the conception of the natives, been gradually growing into the ideal forms of *Light Gods?* Moreover, on what positive evidence is our author's assumption based that the American redskin, the most unimaginative creature on this continent, was really haunted by dreams and inspirations of so classic a nature? We are of the belief that the early history of the red man in America cannot be exhumed with the worn-out tools of theologic symbolism. To call to life again the dead past, the student should lend his ear to the sound of the pickaxe and the spade working in ruins and places of sepulture. More trustworthy results are gained by studying bones and stones than by accumulating books to search in them for myths and lore.

However, in publishing the treasures of the late Dr. Berendt's collection of Maya literature, Mr. Brinton is doing a work for which his fellow-students will always remain thankful to him. The first issue contains six Maya manuscripts of chronological and historical interest. We sincerely wish that these publications may not meet with the fate of those undertaken by Mr. Squier and M. Brasseur, which had to stop after the issue of a first volume. How far the numerous linguistic notes with which Mr. Brinton has illustrated the original Maya texts will find the assent of the native Yucatecan scholars, the future will tell. If he has gone as far wrong in his interpretation of the Maya texts as he has done on various occasions with those of the Spanish, we fear for his rising reputation as a competent teacher in this special province. Still, the accomplishment of so much work within so short a space of time bears testimony to Dr. Brinton's energy and indefatigable application.

À Travers les États-Unis. Notes et Impressions, par le Vicomte D'Haussonville, Ancien Député. Paris. Calmann Lévy. 1883. Pp. 400.

M. D'HAUSSONVILLE has reprinted in this volume the articles contributed to the *Revue des Deux Mondes*, to which reference has already been made in these columns, giving an account of his seven weeks' tour in this country. Coming here as one of the French delegation to the Yorktown centenary, he made good use of his time and opportunities, and, besides taking his share in the festivities that welcomed his party, he studied with open eyes and sharp intellect all that he could see in New York, Baltimore, Washington, Richmond, Philadelphia, Newport, Boston, Chicago, Salt Lake City, San Francisco, and St. Louis. Speaking English perfectly, a diligent student of many phases of political and social life in this country, the author of capital essays on some American subjects, and of careful reports on our charitable and reformatory institutions, he was particularly well fitted to make sensible observations on what he saw and heard and read in his rapid journey.

He describes the freedom of the young women in society, and finds that it has very good reasons to justify it, far removed as it is from the strict conventional rules of French domestic and social life. He attributes much of the bitterness of the Rebellion to the strong influence of the Southern women, and looks to the rapid growth of the whole country as the best means of instilling pride enough in its greatness to overcome all local prejudices and sectional hostility. One of the French delegation was a Virginian who had taken part with the Southern Army in the Civil War, and then had found a place in the French Army. Returning now for the first time to his native country, he forgot entirely his old sympathies in his pride over the wonderful growth that marked the period of his absence. M. d'Haussonville saw in the absolute tolerance of all political opinions one of the happiest conditions of American prosperity, and noticed that the divisions in each of the great parties were greater than those which separate the country itself into opposing political camps. Thus, Stalwarts and

Half-Breeds he found much more bitter toward each other than Republicans and Democrats, while both parties had in their ranks advocates as well as opponents of civil-service and revenue and other national reforms. He was strongly impressed with the suppleness (it is his own phrase) of the Jesuits in adapting themselves to the manners of the country, by the discovery in their College at Georgetown, D. C., of a reading-room open to all their pupils, full of newspapers of all political complexions and of every shade of opinion—something that he frankly admits could not be found in France in a school or college of any creed or of none. He protests energetically against the exclusion of religious instruction from Girard College, and points to it as a warning against the rapid exclusion of the clergy from instruction in France.

On the other hand, it pleased him that a Philadelphia newspaper, in a notice of his own book on 'The Poor of Paris,' spoke very sharply of the want of just such care of the poor in Philadelphia as that exercised by the religious orders in Paris, and by laymen and women under their direction. His visit to the prisons in Philadelphia satisfied him that his wide experience of similar institutions abroad was largely reproduced in the familiar traits of the professional criminals here. In Boston he compared the elementary public schools with the schools of Paris, and found really very little in the methods of instruction to the credit of the former, in spite of their great reputation; but their school rooms were much better and the employment of women as teachers seemed to him a very great advantage. The English and Latin High Schools he put upon the same footing as the best French colleges, with the advantage of absolute freedom of access to all classes and both sexes. In proof of the sad results of the lack of religious instruction, he was furnished with numerous instances of graduates of the public schools who had gone to the bad—the women easily tempted to dissolute lives, the men to irregular habits. But on this point we should have been glad to learn the names, character, and religious tenees of his informants. In New York M. d'Haussonville visited, under police care, the worst parts of the city, and the prisons and other public asylums on the islands. These he found very bad in many respects, while the Children's Aid Society seemed to him the most promising ally for real reform of the classes within its reach.

From his study of these philanthropic questions, as well as from his social amusements, M. d'Haussonville boldly turned to the West to make a hurried trip of eighteen days to San Francisco. Outward bound he fell in with a young Mormon just returning from a mission abroad, and was favored with the sight of a Mormon household, with its five wives and thirty children, on which he builds a very satisfactory picture of domestic life in Salt Lake. This is followed by an unusually full and fair account of the Mormon Church—more so than could have been expected of a Frenchman having strong opinions of the power of the Catholic Church in state and home.

Returning by way of the Southern Pacific route, he observed with great interest the traces of the old Spanish settlers, and the sharp contrast between the rich country of Southern California and the deserts beyond, recalling Egypt and the desert of the East. At St. Louis he tried to revive his boyish reading of Chateaubriand, but 'Atala' was hard to find in the busy, smoky, foggy city. His voyage home supplied leisure for a chapter of general observations, in which he attributes American success to the home-life and religious faith which underlie all classes of the country, much more than to mere material advantages. He mourns over the fact that France lost its hold upon its old colonies, and has left so little trace of its former power and dominion.

Olympia. Das Fest und seine Stätte. Nach den Berichten der Alten und den Ergebnissen der deutschen Ausgrabungen. Von Adolf Boetticher. Berlin: Julius Springer; New York: B. Westermann & Co.

It may safely be said that no one of the recent excavations of ancient sites more fully deserved success, or has more fully attained it, than the German excavation of Olympia. The undertaking was suggested to the present Emperor of Germany more than thirty years ago by Ernst Curtius, who alone, of the many scholars who have wished that it might be done, has seen his wish accomplished under his own superintendence. It was planned with the utmost care by the best science of the time, and the work was executed with the same knowledge and thoroughness. It was made a matter of special arrangement with the Greek Government, and the work was carried on jointly by commissioners appointed from the two countries. It was, as has been repeatedly said by those concerned in it, the first great work of peace taken up by the Government of Germany after the war which made it a united people, and may be looked upon as a sort of memorial of the unification and a pledge of its peaceful aims. There was no serious calamity in the course of the five years of the work to the persons engaged or to the treasures discovered; and the results are a full satisfaction of the hopes that led to the choice of Olympia as a place to be excavated.

It would be impossible here to give any adequate account of these results, and a bare mention of the hundreds of inscriptions, statues, and reliefs, of the thousands of coins and objects in terracotta and in bronze, would be of no value. A few of the more striking single discoveries, whether of objects of art or of interesting facts, may serve better to give an idea of the importance of the work done. The only known original works from two famous sculptors—one a contemporary and rival of Pheidias, the other his greatest successor—have been brought to light in very fair condition by this excavation: the Nike (Victory) of Paionios (to whose hand or design, perhaps, also the figures from the east pediment of the Zeus temple are to be attributed), and the Hermes of Praxiteles, which latter has been generally recognized as the most valuable work of art discovered since the Venus of Melos The statuary of the two pediments of the Zeus temple form an intermediate step between those of Ægina and those of the Parthenon, so that the history of Greek sculpture has now its greatest gap filled up. The first known building of circular form, with a ring of pillars enclosing a portico around it, on Greek soil is the Philippeion, the remains of which were found just inside the western wall of the Altis. The first known instance of anything like a real arch of Greek building is the vaulted passage from the Altis to the Stadion. The foundations and parts of the pillars of the oldest known temple in Greece—the Heraion—were laid bare, and the striking fact that its columns were originally of wood, and were gradually, as they decayed, replaced in stone (a fact which Pausanias suggests by incidentally mentioning that in his day one of the pillars was of oak) seems established by the varying styles of the stone capitals found. A new style of construction, also, was discovered—stone-work overlaid with a cover of molded and baked clay, of which other examples have since been found on the sites of Greek cities in southeastern Sicily and Italy. Proofs of the use of color on terracotta and on stone, both in sculpture and in architecture, were found in an abundance and excellence of preservation far beyond anything known before, so that the rules of the art can now be fairly studied. Various evidences came to light of the common sense of the Greeks even in the domain of art. They were not bound rigidly by rules, but freely varied the material, the ground-plan, the number of pillars, the position and form of steps, the interior arrangements, according to the requirements of the position or use of the building.

Adolf Boetticher, one of the architects employed for a time in the work, has given us in 'Olympia' the first connected account of it aside from the official record. The book, he says, is designed not for the learned in such matters, but for educated people in all spheres of life who are interested in classical antiquity. Accordingly, a considerable part (one-fifth) of the book is given up to an account of the ancient festival, the games, the judges, the sacred rites, etc.—matter derived from the literature of antiquity, but to which no special addition has been made by this exploration. After this, the history of the place is given briefly in four chronological periods, under each of which the objects discovered belonging to it, whether of architecture, sculpture, or whatever else, are described and discussed. There are fifteen plates (several of them on steel) and seventy-four woodcut illustrations in the text. On the whole, the author has done his work very well. It is a little disappointing to be told here and there that the plan of the work forbids further detail, perhaps where one would especially desire it; but so much interesting matter is given that we will not complain of this. Boetticher has his own opinions, and does not hesitate to express them, differing several times from the opinion of his superior officers in their official report, and giving his reasons for it. Sometimes he makes a little slip, as when he says (p. 135) that Pindar's spirit was saddened by the attitude of his native city in regard to the Persian war as early as his twentieth year, which was ten years or more before the first invasion of Greece; or when he speaks (p. 352) of the choragic monument of Lysikrates, a windowless building some six feet in diameter, as having been Lord Byron's "Wohnzimmer" when he was in Athens. It is amusing also to compare his statement (p. 303) that whoever denies the existence of hypæthral temples in Greece is all abroad in the history of Greek architecture, with the somewhat conflicting one in Von Reber's 'History of Ancient Art' (Am. translation, p. 214, note), that "the existence of a so-called hypæthron is inadmissible from the point of view both of design and of structure." But these are trifles; the book, as a whole, is full of valuable and interesting matter. It would well deserve translation into English, if only the translator could have liberty, and be judiciously guided to omit some portions and to make additions elsewhere from the official reports of the exploration. We have noticed only a few misprints; but the author or the publisher ought to have a warm seat reserved for him in the purgatory of those who give us books without an index.

BOOKS OF THE WEEK.

Abbott, Rev. L. Henry Ward Beecher: a Sketch of his Career. Funk & Wagnalls.
Benton, J. Emerson as a Poet. M. L. Holbrook & Co.
Black, J. R. Young Japan: Yokohama and Yedo. A Narrative of the Settlement and the City. In 2 vols. Baker, Pratt & Co. $1.
Black, W. Shandon Bells. Harper & Bros.
Bradley, Rev. G. G. Recollections of Arthur Penrhyn Stanley. Charles Scribner's Sons. $1.
Brehm's Thierleben. Chromo edition. Parts 66-69. Mammals. B. Westermann & Co.
Dickenson, G. Poems and Essays, with Some Account of Minstrels and Minstrelsy of the Middle Ages. Boston: A. Williams & Co.
Discours d'ouverture de MM. les Professeurs de l'École du Louvre. Paris: Ernest Leroux.
Du Moncel, T. Electro-Magnets. D. Van Nostrand. 50 cents.

The Nation.

NEW YORK, THURSDAY, MARCH 22, 1883.

The Week.

THERE is a rumor floating about, which has given rise to a question addressed to the Ministry in the House of Commons, that the British Government is going to demand the return of the surplus of the *Alabama* award. We believe there is not the slightest foundation for the story. The "lump sum" fixed by the Geneva tribunal was paid by England as a final settlement, whether it proved too large or too small. The United States were not to get any more if it proved to be insufficient to satisfy the claims recognized by the arbitrators, nor were they to refund the balance if it proved more than sufficient. Therefore, if the United States were now to pay back what they found no claimant for, it would be a work of pure supererogation, honorable perhaps to themselves, but which no one else has any right to demand or expect. "Finis," in short, was written all over the *Alabama* award, and stamped on the bag containing the $15,000,000, and any one who thinks there is going to be any further international controversy about the matter imagines a vain thing.

But neither this nor the late decision of the English Court of Appeal, that the United States had final control of the lump sum, in the smallest degree affects the moral position of the United States in distributing the award. All that the English court has decided is that whatever the United States may do in the matter is legally unassailable. This we knew before. But no court on earth can make it right to claim and receive money on account of a certain loss, which you would not have received had the Judge not believed your story, and then turn round and deny that any such loss existed, and apply the money to something else, for which the Judge said you were not entitled to anything. This we have done. We claimed money, by names, dates, and amounts, for the insurance companies, and got it. We claimed it for the war-premium men, and were refused it. We then took the insurance men's money, and gave it to the war-premium men. There is no way of putting a good face on this, and the less talk there is about it the better.

We ventured to predict in these columns some time ago that the election of General Butler as Governor of Massachusetts would give the people of that State more "reform" of all sorts and varieties in a given time than could be shown by any other community in the world. He has now apparently created a panic among the legislators and politicians by vetoing an act making appropriations for the charitable and reformatory institutions of the State. He does it, he says, partly because there is great extravagance in the management, partly because the act unites different appropriations for utterly diverse objects. He insists that there ought to be an investigation into the institutions and the salaries of the officials who manage them, before a dollar is paid out of the treasury. This has the true reform ring, and shows the single-minded hatred of abuses as such which the General's knowledge of affairs and men, and his practical study of the art of government, led us to expect of him. The anti-Butler press try to make fun of him by calling him *General Boum*, the famous warrior of the Grand Duchy of Gerolstein; but the General himself is evidently hard at work upon the reform sentiment of the masses, which he reinforces by filling all the vacant places with his admirers and henchmen. He still cracks a joke now and then in his old, merry way, as when he informed his entertainers at dinner the other day, that he could hardly tell which were the gentlemen and which the waiters; but in reform the grim old soldier means business.

The nomination of ex-Governor Sprague for the Governorship of Rhode Island by an Independent Convention would a year ago have looked like a wild venture. But to-day it causes in political circles sensations of a very different kind. The seriousness with which it is discussed by Republican journals as a by no means hopeless thing, shows to what extent partisan leaders and organizations have ceased to be sure of their following. Neither party knows in these days what number of votes it can count upon, and in Rhode Island it is now suddenly remembered that a great many people have become tired of the old way of party management, and are capable of doing anything to show their disgust with it; that ex-Governor Sprague has, after all, in spite of his eclipses and eccentricities, a good many elements of popularity with certain classes of citizens about him; that about two-thirds of the Independent Convention which nominated him consisted of Republican voters, and that if the Democrats accept his nomination and support him heartily, he may find Republicans enough to give him a majority by way of protest against the existing state of things. The disintegration of parties in a period of transition like the present is apt to show itself in surprises of this kind.

The London *Times* and *Pall Mall Gazette*, apropos of Sheridan's case, and the leading French papers, apropos of Byrne's, confirm the position taken by the *Nation*, that whether murder or conspiring to murder is or is not a political offence depends on circumstances, and that it is open to a Government from which the extradition of an assassin is demanded so to treat it. The *Pall Mall Gazette* says, that "what is and what is not a political offence is a question the answers to which vary with the temper of the times, the prejudices of the judges, or the political tendencies of the Governments of the day. It has been our custom in England to give a very liberal interpretation to the term, and we need not be surprised if the authorities in the United States, if not in France," do the same. It further adds that it is needless to say what the English answer to a demand for Orsini's or Mazzini's extradition would have been. The Anglo-French Extradition Treaty expressly provides that no person shall be delivered up if the offence with which he is charged is "viewed by the Government from which the extradition is demanded as a political offence, or as an act connected with such an offence," which is simply the formal recognition of the understanding on which "England has always acted." The *Mémorial Diplomatique* says that "in this case (Byrne's) the crime and the political act are closely connected," and that Great Britain has always in such cases "refused extradition, on the plea that a political idea had alone inspired the act." The London *Times* further makes the confession:

> "It is impossible to deny that similar demands addressed to us by other nations have been met in a spirit which neither the Governments nor the peoples of the Continent have appreciated. There is an evident tendency to rejoice that we are now likely to experience the inconveniences which may arise from insistence upon the political aspects of crime. Our own policy has always been founded to a considerable extent upon the implied theory that people are never discontented without legitimate cause, and foreigners note with a certain malicious satisfaction the enforcement of the lesson that malcontents may be unreasonable, impracticable, and criminal no less than Governments."

The popular indignation at the miserable failure of the trial of N. L. Dukes for the murder of A. C. Nutt is by no means confined to Fayette County, Pennsylvania, where the trial occurred, or to the State which the murderer offends by his citizenship and of which his victim was a responsible and faithful officer. The feeling extends throughout the other States which are governed by law. The excitement in Uniontown over the verdict of acquittal is described as "terrific." Dukes and the twelve jurors were hanged in effigy. A public meeting followed "to let the world know," as the call ran, "that the law-abiding citizens of this county are shocked and horrified, and that their feelings are outraged by the verdict." Official emphasis is given to the popular sentiment by Judge Wilson, who presided at the trial. So strong was the case against Dukes that this fair-minded Judge, in the mere statement of it, was compelled to make his charge bear heavily upon the prisoner. When, in the teeth of overwhelming testimony, the jurors, to the astonishment of everybody in and out of the court-room, returned, after a short deliberation, with a verdict of acquittal, Judge Wilson told them that it gave "dissatisfaction to the Court," that "the evidence was sufficient to justify a different verdict," that they had "committed an error" which the Court unfortunately could not correct; and there is little doubt that, if he had been clothed with the power to do so, he would have promptly overruled the judgment. The only consolatory fact connected with this wretched travesty of justice is the instant and energetic popular comment upon it. The telegraphic reports do not show much "gloom" or "regret" in Uniontown. The feeling manifested was of a far livelier

sort. The murder was not regarded merely as a "painful affair," and the murderer, upon his discharge, was not allowed to resume his place in "society" amid congratulations upon his escape, or at least with silent toleration. The people of Fayette County evidently believe that the failure of justice concerns them quite as much as the murder itself. They permitted the criminal to be turned over in an orderly way to the courts, and trusted to a jury to dispose of his case.

A bill now before the California Legislature is a striking illustration of the horrible confusion which results from the absence of a Federal marriage law. Senator Cross introduced it, and it provides in substance that where a husband and wife have lived separate for four years, whether by agreement or not, the Attorney-General may, on the application of *any citizen of the State*, bring an action to have the bonds of matrimony dissolved, and the Court may thereupon dissolve them on simple proof of the four years' separation, and may, in its discretion, "provide for the support of the wife and children, if there be any, what may be reasonable and just." The bill had reached a second reading when its true nature was exposed by a letter from the wife of Dr. W. F. Smith, denouncing it as a device of her husband to get by legislation a divorce which the courts would not give him. The letter is a powerful one, and winds up with some indignant sarcasm on the clause which empowers the Court to provide for the support of Smith's family, the only reason being Smith's unwillingness to do it himself. She declares that she will not give Smith up, and defies the Legislature, under the Constitution of the United States, to take him from her, and has throughout the best of the argument, both as regards the law and morals.

From Tennessee comes the startling news that the Legislature of that State has passed a bill "pensioning all Confederate soldiers who lost one or both eyes during the war, and all Federal soldiers not pensioned by the United States Government." It will be remembered that this is the same State which repudiated a large part of its debt on the ground, among others, that its people were too poor to pay the whole of it. Does it not strike the statesmen of Tennessee that if their people are rich enough to go ahead of all other States in establishing a pension system of their own, they might also be rich enough to restore the character of their State as an honest commonwealth by discharging its obligations to its creditors? However, the notions of public faith prevailing there, as they encouraged Treasurer Polk to "appropriate" to himself the interest due to the creditors, may also encourage some future official to run away with the pension fund. Tennessee is making a reputation as a school of public morals.

The ladies in and about Boston, who have had what is called the "Harvard Annex," for the higher education of women, in charge during the past four years, have made a very modest statement and appeal in behalf of the continuance of their work. The small sum of $15,000 with which they began it four years ago has been exhausted, in spite of the fact that a good deal of the instruction was given by the professors gratuitously, and that there were no expenses for buildings. The promoters now seek to raise a sum of $100,000, which would be sufficient, it is hoped, with the aid the College would give, to put the Annex on a permanent footing as a dependency of the University, in which studiously-inclined young women could get the same kind and degree of instruction as are given to young men in the College proper. There is, however, no other "co-education" properly so called in the matter. The students of both sexes would pursue the same studies under the same professors, but not at the same hours or in the same places. We have little doubt, too, that if Harvard were as rich, or nearly as rich, as Columbia, the expenses would not have to be raised by subscription. The College would give the women what they ask for out of its own treasury, were it so overflowing that it could afford to put up $1,000,000 worth of buildings out of its income, without cutting down its expenses, within seven years. Harvard, however, owing to its happy policy of publicity, and close moral and intellectual contact with its graduates, rarely needs to pay for a building at all. It has had since the war three large and expensive dormitories presented to it by private donors, a large and expensive building for recitation-rooms, besides a gymnasium, and a law school, each costing $100,000 at least. In fact, as soon as it makes a want in buildings known, it is not long before some one makes his appearance, to say that the work shall be done. The other gifts for the direct purposes of instruction are also very large. But the College unhappily receives but little money by donation for its general fund, over which the Corporation has complete control, owing to that not ignoble weakness of human nature which makes nearly every giver anxious that his gift should in some manner commemorate him to posterity. It consequently has no money to meet new demands on it, or open new fields of usefulness like that known as the higher education of women; and there is among those who are most interested in it in Boston probably as strong a dislike to what is called co-education, or education of both sexes in the same rooms, as exists here—perhaps, even as strong as that which burns so fiercely in the breast of Dr. Dix.

The gentlemen mixed up in the Star-route "trouble" are one by one losing their tempers in a very sad way. Dorsey the other day assaulted an old man of seventy with great brutality, hitting him in the face and kicking him in the stomach. Now comes Mr. Blaine's friend, Mr. Bosler, the old Indian contractor, in whose return to Congress he expressed so much affectionate interest in a letter written last summer, and is held to bail on a charge of assaulting a Deputy United States Marshal. The Marshal says he went quietly into Bosler's bedroom to serve a subpœna. Bosler says he forced his way in. The Marshal says that Bosler was in bed to avoid service. Bosler says he was in bed because he was sick. The Marshal says he entered silently and had to shake Bosler to wake him up. Bosler says he came in drunk and swearing. Both agree, however, that Bosler jumped out of bed and hit the Marshal several times with a billet of wood, which is the offence with which he stands charged.

The Philadelphia *Evening Telegraph* makes the astounding assertion that we, in our article on the Dude, said that "American boys are either Cads, Anglomaniacs, or Dudes. Taking this sad misinterpretation of our remarks as a text, it points out that, as the poet teaches us, the boy is father to the man, and that it is our boys who must, as time goes on, develop into the "props and pillars of the State," who are to manage our governments, local and national, build our railroads and steamships, be our teachers, lawyers, physicians, authors, artists, and preachers. It then proceeds to show that we need not despair of the Republic, because fops, and dandies, and swells have before now, at critical times in the history of this and other countries, turned out to be full of manliness and vigor. Many an English dandy of thirty years ago proved himself a hero in the Crimea, and so did the corresponding class here in our war. This is true, and we hope that when the time comes for testing the Dude in war, he will give as good an account of himself. But he is less aggressive by nature than his predecessors, less warlike, less full of mettle, more shrinking, even in time of peace; so there is no safety in prophesying how he will behave in war. The Cad will not behave well, because it is the nature of the Cad to behave ill under all circumstances, whether in war or peace. The Anglomaniac might do his duty in a war in which England was our ally; but of course in a struggle with England he would be terribly tempted to go over to the enemy. But the fact is that the *Telegraph* wilfully perverts the truth, for we never said that all the boys of the United States, or even of New York, were either Cads, Dudes, or Anglomaniacs. We simply said that *some* boys were Dudes, and tried to account for the development of the type—a position which the merest tyro in logic must perceive at once is totally different from that attributed to us.

The opponents of jury trial will derive some encouragement from the Dukes-Nutt verdict, especially in the light of a newspaper interview with one of the jury, who has been requested to explain how it all happened. Mr. George Washington Breakiron is the juryman's name. He seems to have been a perfectly fair man, and had no prejudices derived from reading about the case, for he does not know how to read. He says that the first thing that happened on retiring was that some one asked, "Are we all Democrats?" upon which it appeared that they all were. Mr. Breakiron suggested that that was all wrong; but, as it was a misfortune that could not be helped, they went to work to decide the case, first, however, joining in a prayer. To reach a decision they took part of the evidence given at the Coroner's inquest and part of that given at the trial, and, by combining them, arrived at the conclusion that the killing was done in "self-defence."

Mr. Joseph Arundell, of Rabun County, Ga., killed one of his neighbors in 1876. He has only just been brought to trial, and has been acquitted. Both he and his victim are reported as moving in "high circles." It is also reported that though twenty-seven homicides have been committed in Rabun County since the war, no conviction has ever taken place. Under these trying circumstances, the Dukes-Nutt affair is naturally giving a good deal of comfort to the Southern apologists of homicide, if we may judge from the letters we receive. Even if the Dukes-Nutt verdict, however, had not filled the State and county in which it was rendered with horror and indignation, even if the jury which dared to return it had not had to conceal themselves from the public gaze, it would not furnish materials for a respectable *tu quoque*, as we have already several times pointed out. One unpunished business or social homicide does not prove as much as dozens annually, although some of our Southern brethren seem to have fallen into this very droll mode of reasoning. According to them, one murder in ten years proves just as much about the insecurity of life in a particular locality as fifty.

They have recently been treated to a spectacle in England which probably but very few ever expected to see again—a conviction under the old statute against blasphemy. The Christmas number of an infidel paper called the *Free Thinker* contained the blasphemous libel on which the indictment was founded, ridiculing the leading doctrines of Christianity in a very offensive way, but not worse than Col. Bob Ingersoll's way in this country. The prosecution was set on foot by a body called the "Society for the Suppression of Blasphemous Literature." The first trial ended in a disagreement of the jury; the second resulted in conviction, and the editor has been sentenced to twelve months' imprisonment with hard labor, and the publisher to three months' hard labor. The severity of the sentences has excited considerable indignation, not because of sympathy for the offenders, whose language the sceptics generally acknowledge to have been outrageous, and a real wrong to believing Christians, but because the Judge was evidently animated by "theological bias" in passing sentence, and made no secret of it. He treated Foote, the editor, as a servant of "the devil," and gave him, apparently as such, a crushing sentence; whereas, if punishable, he was only punishable properly as a person guilty of annoying his neighbors. The sceptics hold, and with considerable force, that Judge North knows no more about the devil than Foote, and should have confined himself to his proper sphere. That the affair has done religion no good was plainly inferrible from the conduct of the crowd of free-thinkers who filled the gallery. They rose *en masse* when sentence was passed, and heaped execrations on the Judge, calling him names, and reviling Christianity, while Foote hurled defiance at him from the dock; and the tumult was only brought to an end by clearing the room. The Society now talks of prosecuting Tyndall, Huxley, Spencer, Morley, and Dr. Martineau for blasphemy; but, as this would result in having its labors brought to a speedy end, it will probably seek some less conspicuous field of labor.

We felt, on reading the first news of the assault on Lady Florence Dixie, that, considering the nature of some of the other crimes committed in the course of the Irish agitation, there was nothing wildly improbable in an attempt on her life. It was an extraordinary story, it is true, as told in the first meagre despatch, but we presumed that later news would supply confirmatory and explanatory details. We are compelled to say, however, that these have not come, and, as the matter stands, it begins to wear a somewhat unpleasant look for Lady Florence, and to give plausibility to the denial put in by the Irish members of Parliament. The smallest shred of circumstantial corroboration would be most valuable, and yet nothing of the kind is forthcoming. It is to be observed, in the first place, that the whole story is most romantic. The affair might have been taken bodily out of one of Rhoda Broughton's novels. Nothing could be more picturesque than an attack by two disguised assassins on a lady, in broad daylight, in her own grounds, with daggers, and her rescue by her faithful St. Bernard dog, without the slightest injury. There is hardly a sensational novelist of the better class in our day who would venture on such an incident, and yet there is probably not one who on reading Lady Florence's account did not wish that he or she had ventured on it.

In the next place we have two men bent on murder, disguising themselves for a walk on the public highway, and a much frequented one, in a costume that would not only be likely to attract attention, but greatly to impede their escape if pursued, and make their arrest and detention certain if stopped or suspected by any peace officer. They met Lady Florence at a wicket gate opening from her grounds on the high road, at some little distance from her own house, it is true, but not in a secluded place. On the contrary, their attack on her seems to have been made only a few yards from the road. They knocked her down and began stabbing her with daggers, but although powerful men, and bent on her death, only stabbed through the strongest and thickest portions of her corset, and in every case failed to inflict even a scratch upon her person. One terrible blow, she says, she parried with her right hand and another with her left, but in neither case did she suffer any damage beyond the cutting of her glove. Not even the skin of her hand was touched. At this point—4 P.M.—she swooned, and the last thing she remembered was seeing the dog pulling one of the assassins off her. The assassin, although he might have killed the dog with a blow of the dagger, refrained from injuring the animal. His mistress lay in the swoon for three-quarters of an hour, and then got up and walked home. The dog, however, did not reach the house till after she had done so, and she concluded that he had in the meantime been in pursuit of her assailants. He does not appear, however, to have barked at all, for a gardener was at work thirty yards, or the width of four or five New York houses, from the scene of the outrage, and says he heard no noise whatever and saw nobody, although Lady Florence says "she called loudly for help" when first attacked. Moreover, the first accounts represented Lady Florence as "greatly prostrated" by the affair, which was not surprising. But the correspondent of the New York *Herald* had an interview with her on the following day, within twenty-four hours of the outrage, and found her "in the road, surrounded by gentlemen," "her dress (cardinal jersey), animated appearance, and manner showing no traces of the severe and terrible ordeal through which she had gone." It will be easily seen from all this that there is another side to the affair, which calls for close examination in the interest of everybody. Any mystification under such circumstances would be hardly less criminal than the assault.

The complete failure of the Socialist demonstration in Paris is something of which the new Ministry may well be proud, and it will do much for the reputation of the Republic, too, which has been suffering ever since Prince Napoleon's escapade. The Socialist celebration has, ever since it was announced, had a most unfavorable effect on business, and has kept away from Paris a large number of visitors, who did not care to witness street-fighting. The day has come and gone, however, with perfect quietness. The Government kept a powerful military force ready but invisible in barracks, and had the streets well patrolled by police, so that the would-be rioters, or demonstrators, were converted into peaceable promenaders, and had to give vent to their feelings by retiring to their restaurants, and drinking confusion to society, and government, and laws, and religion, and morals, and manners, and marriage, and paternity, and maternity, and property, and order, and everything but food and clothing.

Prince Bismarck has published the decree of the Bundesrath, prohibiting the importation of American hog products into the German Empire. The decree goes so far as to require proof positive that such products are not from America. That is to say, if a consignment of bacon comes from England, or France, or any other country, it must be accompanied by proof that it is of the growth and production of that country, or of some country other than America. The commercial effect of the decree will be to cause England, France, and other trading nations to import more American hog products for their own consumption and to export their own to Germany. This will raise the price of pork to German consumers by as much as the new channel for obtaining their supplies is more costly than the old. This is manifestly the object of the decree—that is, it is a protectionist measure in the interest of the German landowners, swineherds, and pork butchers. The pretence that it is a sanitary measure intended to prevent the spread of *trichina spiralis*, from which the inhabitants of the United States are perishing in large numbers in consequence of eating their own pork, has been held up in a rather glaring light by the commercial bodies of Hamburg.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 14, to TUESDAY, March 20, 1883, inclusive.]

DOMESTIC.

ON Thursday the President appointed A. W. Wyman, Assistant-Treasurer of the United States, to be Treasurer in the place of Mr. James Gilfillan, whose resignation has been accepted, to take effect on the 1st of April.

The President on Tuesday appointed George R. Page United States Judge for the Southern District of Ohio, vice William White, deceased.

The Naval Advisory Board, in conformity with Secretary Chandler's instructions, submitted to him on Wednesday a report embodying the general features of a plan for the 3,000-ton cruisers authorized by the Act of Congress of August 5, 1882.

Secretary Chandler on Thursday sent a cable message to Lieutenant Harber, authorizing him to continue the search for Lieutenant Chipp and his party during the coming summer, if he thought it advisable. This was in answer to a suggestion to that effect made by Lieutenant Harber in his recent report to the Secretary.

In response to inquiries from Collectors of Customs at various ports, in regard to the new tariff law, the acting Secretary of the Treasury has instructed them that duties should be assessed upon the full invoice value of merchandise, covered by invoices stating the value of the goods free on board at the foreign port of shipment; that is, the value including charges, costs, and commissions, without regard to the provisions of Section 7 of the new tariff act, which abolishes the duties on such charges. He suggests that importers pay the duties under protest, so as to protect any rights they may have in the premises. The question whether an estimate may properly be made in such cases by the appraising officers to cover the charges and commissions, and whether the amount of such estimate may thereupon be deducted from the invoice value, is reserved for future consideration, and until after he shall have received reports in regard to the matter from the proper officers.

Special Agent Townsend, in a communication from the Sac and Fox Indian Agency, under date of March 15, writes to the Commissioner of Indian Affairs that a reign of terror prevails among the Creek Nation, owing to internal dissensions, and that he thinks it advisable that the Government should interfere.

General Crook, commanding the Department of Arizona, on Thursday reported to the Commissioner of Indian Affairs at Washington that there were fifteen Indians sick with smallpox at Peach Springs, near the Atlantic and Pacific Railway. The Commissioner directed the physician at the San Carlos Agency to attend to the medical wants of the Indians, and informed General Crook accordingly. On Friday the Commissioner received a despatch from General Crook, dated Whipple Barracks, A. T., March 15, 1883, saying: "The Indians need something besides medicine. They have nothing to eat, and in their efforts to get something may inoculate the whole country." Commissioner Price telegraphed General Crook that there was no fund with which to purchase supplies for these Indians, but suggested that if the War Department would supply their immediate wants he would endeavor to have Congress reimburse the Department at the next session.

Returns to the Department of Agriculture of the cotton sent to market from plantations show an aggregate of 5,900,000 bales gone forward up to March 1. This is about 86 1-3 per cent. of the crop as indicated by the last return of product.

An investigation of the consumption and distribution of corn and wheat up to March 1 has been completed by the Department of Agriculture. It makes the stock of corn on hand at that date about 580,000,000 bushels, or 36 per cent. of last year's crop. Of this, 380,000,000 bushels are in the States of the central basin, north of Tennessee, and 166,000,000 bushels in the Southern States. Most of the remainder is in the Middle States. The proportion of wheat on hand, March 1, is 28 per cent. of the crop, or about 140,000,000 bushels. The proportion of the last five years at that date is nearly the same. In the States of the central basin the total reported on hand is 104,000,000 bushels.

O. W. Denny, Consul-General of the United States at Shanghai, China, has forwarded to the State Department $2,355, United States gold coin, to be placed to the credit of the Garfield Memorial Hospital Fund. Of this amount $300 was contributed by Chinese friends of Mr. Denny, who, in forwarding their subscription, said they "would be most happy to head a Chinese circular and send it around among our friends, but to ask our countrymen to subscribe to a hospital to be built in a country which will not permit the Chinese to enter it for ten years is more than we dare do." The remainder of the contribution was obtained from citizens of the United States residing in China.

Thomas J. Brady, one of the defendants in the Star-route trial, was called to the witness stand on Wednesday. His testimony consisted of denials. He had never had the conversation with Walsh which the latter had described; he had never been bribed by any of the defendants, and had never entered into any combination or any agreement with them to defraud the Government by means of costly increase and expedition. He had never been intimate with Stephen W. Dorsey, and had never liked him until they were persecuted together. As for the Star service, he had tried to build it up for the benefit of the people, and had acted under the instructions and with the approval of Postmaster-General Key, who had favored even greater liberality than he had advocated. Brady was cross-examined by Mr. George Bliss on Thursday and Friday. The questions were confined for the most part to the orders for increase and expedition made by Brady when in office, and although numerous inconsistencies in the witness's testimony were brought out, nothing of very great interest was elicited.

Senator Blair, of New Hampshire, in an open letter, denies the newspaper reports that he has combined forces with Mr. Rollins in the coming Senatorial contest in that State, and declares that he never will form an alliance with Rollins, Briggs, or Chandler, nor make a combination with any candidate. He says further, that while acknowledging himself a candidate, he will not fight for re-election.

The Rhode Island Independent State Convention met on Wednesday and nominated ex-Governor William Sprague for Governor. No other nominations were made, and a committee of seven was appointed to confer with any organization in regard to the remainder of the ticket. It is believed that they will endorse the Democratic nominees for the minor State offices. On Thursday the Republican Convention met and nominated Augustus O. Bourn, of Bristol, and Oscar J. Rathbun, of Woonsocket, for Governor and Lieutenant-Governor, respectively. The present incumbents of the remaining offices were renominated. The Democratic Convention on Tuesday nominated William Sprague for Governor by an almost unanimous vote. Charles H. George, of Providence, was nominated for Lieutenant-Governor.

The Republican State Central Committee of Georgia met on Thursday and appointed a special committee of ten to manage the campaign for Governor. It was deemed inadvisable to hold a convention.

The bill to settle the Tennessee State debt at fifty cents on the dollar, with three per cent. interest, passed the Senate on Thursday, and has been signed by the Governor.

The report of the Massachusetts Legislative Committee on Education upon so much of Governor Butler's message as refers to the defects of the school system, and the bad showing of Massachusetts as regards illiteracy in comparison with other States, enters a protest against the arraignment of the State on these grounds. The Committee points out that the foreign-born population of Iowa, the State with which the comparison was made, comes mostly from countries where education is universal, while the foreign-born population of the cities and large manufacturing towns of Massachusetts is of a wholly different class.

The jury in the case of N. L. Dukes, on trial at Uniontown, Pa., for the murder of Colonel Nutt, whose daughter Dukes had seduced, returned a verdict of not guilty on Wednesday. The Judge expressed his amazement and condemnation of the verdict, and the excitement in the town was intense. Stuffed effigies of Dukes and the twelve jurors were carried about in the streets of Uniontown, and on Thursday an indignation meeting of citizens of Fayette County was held, at which appropriate resolutions were passed. The verdict has been much commented on by the press. Dukes is a member of the Lower House of the Pennsylvania Legislature, and on Tuesday the sub-committee of the House Judiciary Committee decided to recommend his expulsion without a hearing.

William H. Bright, Clerk of the United States Circuit Court for the Northern District of New York, has tendered his resignation, in consequence of a notice in writing received from Circuit Judge Wallace that a change in the clerkship was intended. In giving this notice Judge Wallace expressed regret at being obliged to make a change, saying he was entirely satisfied with Mr. Bright's performance of his duties, but was so situated that he had no choice in the matter. District Judge A. C. Coxe, Conkling's nephew, is understood to have written in similar terms, and conveyed the impression that the change was against his wish. Judge Wallace's avowal that he is not acting on his own motion suggests that the same influence that made "Tim" Griffith Clerk for the Southern District has been at work in Bright's removal, viz., Conkling's influence.

The Longfellow Memorial Association of Cambridge has received a letter from Mr. Bennock, in London, which says that all the preliminaries for placing a bust in Westminster Abbey are now arranged, sufficient capital having been subscribed, the sculptor engaged, and the position for the bust selected. The latter is a column standing between the memorial niche of Chaucer and the Independent bust of Dryden, with a full and uninterrupted stream of light falling on the position, so that the bust will occupy a central and conspicuous place in the poets' corner.

It was announced some time ago that the Prince of Wales was contemplating a visit to America, and the manager of the Louisville Southern Cotton Exposition sent him an invitation to visit that city during the Exposition. In reply to the invitation the Prince says that there is no foundation for the report that he intends to visit America during the present year.

FOREIGN.

On Thursday great excitement was caused in London by a heavy explosion which occurred in the Local Government Board Offices near the Houses of Parliament. The concussion was felt in the House of Commons, and the noise was heard for a distance of several miles. Investigation indicated that either dynamite or gunpowder had been used to cause the explosion. The damage is placed at £4,000. The affair was ascribed to the Irish conspirators. A reward of £1,000 has been offered for the discovery of the perpetrators of the act. The English press commented in the strongest terms upon the affair. The *Times* said on Friday: "If the Irish Extremists are really going to reply with dynamite to any measures they

disapprove, it is certain that the day of remedial legislation is over." On Saturday the excitement caused by the explosion was intensified by the statement made by Lady Florence Dixie that, while walking near some woods at Windsor, she was attacked by two men disguised as women, who assaulted her with daggers. Lady Dixie says she fell in a swoon at the sight of the daggers and did not recover for three-quarters of an hour. She then found that her gloves had been cut in the palms and that there were two dagger-holes in the breast of her dress. She was, however, not wounded at all, nor was her St. Bernard dog, to which she attributed the saving of her life. The cause ascribed for the attack was her charges against the Land League officers in relation to the disposal of the funds of the League. Later despatches throw doubt upon Lady Dixie's story, and it is suspected to be another "Whittaker case."

The explosion being the subject of consideration in the House of Commons on Thursday night, Sir William Harcourt, Home Secretary, said he did not think it would be right to say anything about the matter until an official inquiry had been made. He had heard that an attempt had been made to blow up the *Times* office, but that no injury had been done.

Mr. Gladstone, in a speech in the House of Commons on Wednesday afternoon, on Mr. Parnell's amendment to the Land Act, said that tenants were willing to pay the rents fixed by the courts. He hoped Mr. Parnell would give assurance that the new crusade would be conducted in a strictly legal manner. It would be in violation of the duty of the Government to demand further sacrifices from landlords. Mr. Gladstone's remarks were repeatedly cheered by the Tory members. The second reading of Mr. Parnell's bill was rejected by a vote of 250 yeas to 63 nays. On Friday a motion was made by Mr. Kennard, declaring that in view of the complete satisfaction of all demands of American citizens upon the sum allowed by the Geneva Conference for the *Alabama* claims, the balance should be restored to Great Britain. The consideration of the motion was, however, deferred, owing to the counting out of the House. On Monday, Lord Edmund Fitzmaurice, Under Foreign Secretary, in reply to questions, said that the Government had never proposed to appoint an English resident at the Vatican. He also said that no demand for mediation in the trouble between France and Madagascar had been made, and that the Government had no intention of increasing the number of British ships in Malagasy waters.

The Most Rev. John MacEvilly, Archbishop of Tuam, replying to Earl Spencer, the Lord Lieutenant, in behalf of the Catholic Bishops in Ireland, writes that the action of the Government in insisting on extending relief to the distressed people through the workhouse is an outrage on humanity, and a covert system of exterminating the native race.

At a meeting of the Cabinet at Windsor on Monday, Lord Carlingford took his seat as Lord President of the Council, in place of Lord Spencer, resigned. Lord Carlingford will also assume the duties of Minister of Agriculture.

Lord Dunraven intends to propose at the present session of Parliament motions in favor of legislation in behalf of Irish laborers and for a large scheme of emigration, in order to prevent a recurrence of distress in Ireland.

A meeting of Irish, Scotch, and English members of Parliament was held in London on Wednesday, at which it was decided to form a political committee with a view to informing public opinion in regard to Irish reforms. The committee is regarded as an impartial one. No Parnellites are connected with it.

Mr. Parnell is now in Paris. He spent Sunday with M. Clémenceau and Henri Rochefort. It has been arranged that he shall go to America, Mr. Sexton remaining to watch proceedings in Parliament.

It is expected that the emigration to Canada from Europe during the ensuing season will be unusually extensive. The steamer *Parisian*, which sailed from Liverpool for Halifax on Thursday, took 450 emigrants. A large number of Scandinavians and Germans will proceed to northwest Canada in the course of the next five weeks.

The annual boat-race between Oxford and Cambridge Universities took place on the Thames on Thursday, and resulted in a victory for Oxford by three lengths. The betting at the start was seven to two on Cambridge.

In the French Chamber of Deputies on Monday, a Radical motion relative to the grievances of the mining population was rejected by a vote of 294 to 116. M. Ferry stated that the Government after Easter would introduce a bill for the relief of distressed workmen. In the debate upon the motion to grant amnesty to political press offenders, M. Waldeck-Rousseau, Minister of the Interior, insisted that the present moment was untimely for such action, and that a calmer condition of popular feeling should be awaited. The motion was rejected by a vote of 399 to 83. The Chambers have adjourned for a month.

The French Government has resolved to expel, upon the completion of their sentences, all the foreigners who were convicted of implication in the recent riots in Paris. They are most of them Germans. Twenty-two Communist banquets and meetings were announced to take place in various parts of Paris on Sunday, and the Government took precautions accordingly; but the day passed off very quietly, and the mass-meeting of Communists which was advertised to take place at Père-la-Chaise Cemetery was not held.

The Russian Government has proposed to the other powers that an international detective force be organized to cope with Anarchists, Nihilists, Fenians, and Socialists. France, Switzerland, and Austria have acquiesced in the proposal.

A despatch from St. Petersburg on Wednesday said that two dynamite depots had been discovered there. Forty persons were arrested on Monday. Last week's arrests number 200. The Government has decided to expel all Italians who are without permanent occupation. The Governor of Moscow has received a letter warning him that the Kremlin, where the Czar is to be crowned, will be blown up during the coronation ceremony if the Czar refuses to grant a constitution.

The funeral of Prince Gortchakoff took place from the Russian Chapel at Baden-Baden on Wednesday. An autopsy disproved the allegation of poisoning.

The existence of a branch of the "Black Hand" Society has been discovered in the northern part of Portugal, and troops have been sent to that locality. Several arrests of members of the society have been made and important papers seized.

Signor Mancini, Minister of Foreign Affairs, replying in the Italian Chamber of Deputies to criticisms on his policy, said that to those who reproached him for having vainly sought an Austro-German alliance he would answer, that a power whose subjects numbered 30,000,000, and which possessed an excellent army and navy, only offered its alliance to those desiring it after ascertaining that it was desired. The statement that the Cabinet had met with a refusal at Berlin and Vienna was untrue. He said there was a manifest conformity of action between Italy, Germany, and Austria. The Government, he said, would repress with vigor all Irredentist manifestations. The recent demonstrations of the Irredentists had not affected the relations between Austria and Italy. Signor Mancini concluded by asking the Chamber for an explicit vote of confidence.

A despatch from Berlin says that Prince Bismarck has written to the Bundesrath recommending that, in order to prevent an evasion of the law, hog products be admitted into the country only on attested proof that they are not from America. A decree has been gazetted prohibiting the importation of American hog products, including sides, bacon, and sausages.

The London *Post's* correspondent at Berlin says Prince Bismarck has abandoned his intention of submitting a bill for the revision of the May laws until more positive and conciliatory results are obtained from the negotiations with the Roman Curia.

The Upper House of the Prussian Landtag has adopted the budget in the same form in which it was adopted by the Lower House. The Landtag has been prorogued until April 15.

The Lower House of the Austrian Reichsrath has adjourned, after adopting the budget and the bill for the relief of the sufferers by the floods.

The Spanish party of the Dynastic Left have appointed a committee to manage the party, as Marshal Serrano desires to resign the leadership.

The representatives of France, Italy, Belgium, Spain, Portugal, Rumania, Servia, Switzerland, Brazil, the Argentine Republic, San Salvador, and Guatemala signed on Tuesday the convention adopted by the conference which has been in session in Paris, securing to the citizens of the various States the same advantages with respect to patents, designs, trade-marks, and commercial names that other countries accord to their own subjects. England is holding off, and will defer action until the bills now pending in Parliament are passed.

The news from China is that the French transport, with the first instalment of troops for the Tonquin expedition, has arrived. It is currently reported in Shanghai that the British authorities propose to resort to forcible measures if private business is obstructed by the Chinese. The British Telegraph Company desires to land a new cable at Shanghai, but has acknowledged doubt of its right to do so, and has asked permission from the Chinese officials, who have withheld their answer for several weeks. The British Foreign Office is said to have telegraphed instructions to land forcibly, if necessary.

A despatch from Bombay says that the Indian budget fully discusses the competition of Indian with American wheat in the London market. The budget report states that India, though at a great disadvantage with regard to internal communications, has a great advantage through free trade. Railway rates from the north to Bombay are to be reduced immediately 18¼ per cent., which is equivalent to a reduction in the price of wheat of 1s. 6d. per quarter in the London market. The report anticipates a reduction in rates on other lines directly.

In the Canadian House of Commons on Monday, Mr. Ross, of Middlesex, moved for the correspondence between the Governments of Canada and the United States, or any board of trade of Canada or the United States, upon the question of reciprocal trade relations between the two countries on the general basis of the Reciprocity Treaty of 1854. He spoke at considerable length in favor of an attempt being made to reëstablish reciprocal trade relations with the United States, quoting a quantity of statistics to show that the natural market of Canada for her surplus products was the United States. He thought the present an opportune time for opening negotiations, on account of the proposed abrogation of the Washington treaty. Canadians would have in their fisheries a valuable consideration to offer in return for reciprocal trade. After some discussion the motion was carried.

THE LONDON EXPLOSION.

The explosion in London may have been gas, but it was most likely dynamite, and Fenian dynamite it will undoubtedly be believed to be by most Englishmen. It, consequently, in the present state of the relations of Ireland and England, may be considered a political event of much importance. It will probably increase the panic and exasperation caused by the Carey revelations in Dublin, and strengthen the Tories and reactionary Liberals who are in favor of a more energetic policy of coercion and repression than that which Mr. Gladstone is pursuing, or is willing to pursue. For one of the unfortunate effects of the government of one people by another and a very different one (which is the kind of government that exists in Ireland), is that the Minister of the governing country can never wholly consult his own judgment as to the kind of legislation the governed country requires. He has to be guided in the main by the feelings, opinions, hatreds, or prejudices even, of the other and it may be very different country. This has been Mr. Gladstone's difficulty all through in dealing with the Irish question. He has never been able to do just what even the best and most rational Irish opinion called for. He has had to do what English opinion, however poor or ill-informed, would permit.

Now, there is no tendency more marked in English opinion on Irish matters than the tendency to consider the whole population of Ireland as responsible for the assassins, incendiaries, and outrage men of the last three years. It is not an unnatural tendency. It is fostered if not justified by the apparent sympathy of the Irish people with the criminals, and by their unwillingness to give evidence against them. But the very worst mistake a statesman who is occupied with measures of healing can commit, is to make this presumption a basis of his policy. No measure can be healing which does not give the people for whom it is intended credit for being worthy of it, and entitled to it. He has to pretend to think well of them, even if he really does not. He cannot indict them, and he ought not if he could. Nevertheless, this presumption is in a measure forced on Mr. Gladstone by the state of English feeling. It has taken full hold of several of his colleagues. Lord Hartington, for instance, though he admits that Ireland ought to have a representative county government, instead of the grand juries, avows his unwillingness to give it in the presence of the Carey revelations. Sir William Harcourt probably shares this feeling in the fullest degree. That the bulk of the Liberals share it was pretty clearly revealed the other day in Mr. Forster's attack on Parnell, in which he let it be seen that he thought the outrages furnished the true indication of the kind of legislation Ireland most needed; and since the Dublin discoveries, Mr. Forster has become to most Liberals the great authority on Ireland.

Consequently, the London explosion must be considered a great calamity for both countries. It will satisfy tens of thousands of doubting Englishmen that Irish Home Rule in any form would mean the rule of those who are now prominent in agitation by assassination and dynamite, which it would therefore be madness, and cruelty to decent people, to concede. It will increase their determination to wait till Irishmen become peaceable before redressing even their undeniable grievances. The fact that this waiting has now lasted some centuries without result will fade from their minds, and they will sit on as patiently as Horace's peasant on the bank of the stream.

The worst of it, and, in fact, one might in this case accurately and truly say the devil of it, is, that the more frightened or exasperated these outrages make Englishmen, the better pleased the authors of them are. The policy of the extreme Irish party was frankly revealed by Patrick Egan here a day or two ago to a reporter, when he said that the more coercion England was driven into the better. They do not want healing legislation at her hands. They do not want reconciliation. They want separation—either complete or partial. They know they cannot get it by force. They hope to get it by wearing out English patience. The more alarm, disgust, and fury they excite in English breasts, therefore, the better they are pleased, and they are able to reconcile the more moderate of their own countrymen to their policy by pointing to the undeniable fact that the redress of Irish grievances has always been procured not by appeals to the reason or humanity of Englishmen, but to their fears. Probably, therefore, thousands of Irishmen chuckle over the English panic who would on no consideration aid in producing it. The senselessness of blowing up the office of the Local Government Board, therefore, when the real seat of the Government, the Parliament House, was so near at hand, is not, from the Fenian point of view, so great as it seems. The same thing may be said of the attempt on the *Times* building. It does not much matter what building is blown up as long as the explosion produces panic or even fury among Englishmen. Of course, the destruction of the Houses of Parliament, on the scale once attempted by a conspiracy of English Catholics, would be a greater blow, but the Parliament Houses are well guarded. If the blowing up of something else produces the desired effect —that is, makes Englishmen look on it as the Irish answer to Mr. Gladstone, or Mr. Forster, or no matter whom—the dynamite men are satisfied.

We have not the smallest belief that Parnell or the leaders of the Land League have anything to do with the society of murderers who are carrying on their operations in both England and Ireland, but they unquestionably encourage them, not so much by failing to condemn the murders and outrages, as by decrying and denouncing all the attempts made to punish them. We have looked in vain through the utterances of the Leaguers during the past six months for an admission that anybody arrested by the Government was a murderer, or deserved to be punished, or was fairly tried. No matter on whom the police lay their hands on suspicion of crime, the Land League organs talk of him as an innocent man, the witnesses against him as perjurers, the judge and jury as corrupt, and the sheriff as an assassin. Mr. Parnell's speeches are full of denunciation of the courts which are trying, or are to try persons in Ireland accused of murder; but not one word does he say of the necessity of pursuing and punishing the murderers in some way. Mr. Patrick Egan, the Treasurer of the League, who is now over here, is speaking in various parts of the country and denouncing "the hanging of innocent men" through spies and informers and packed juries; but, so far as reported, he says nothing indicating that murders have been committed on the Irish side, or that it is anybody's business to punish them, or that any such murderer has ever been caught. It is both curious and shocking that nearly all the late expressions of feeling about Carey's revelations which have come from the same quarter consist in abuse of Carey. Of abhorrence for the accused or belief in their guilt, of any reason for believing them not guilty, or of any desire to see them punished if guilty, not a word.

The Land League has among its constituents a very large body of people who are really still—to the shame of Englishmen—in an almost savage condition. A large part of the Irish population have really never been civilized enough even to profit by such moral culture as the Catholic Church bestows. Their evil tendencies have been fostered by the land system, the arbitrariness and violence and injustice of which furnished a constant incentive to crime. The wholesale evictions, which were one of its incidents, and occurred every year, kept alive from generation to generation the worst passions of human nature in the hearts not only of the evicted but of their neighbors and friends. People with this sort of training have to be carefully talked to by leaders who wish to keep on terms with the civilized world. Mr. Parnell and Mr. Egan cannot with impunity tell them that the Government "is a brutal and coercive foe, which is hanging innocent men, bayoneting women, and shooting down children." This may be all true; but if so it is one of those truths which Irish orators for their own sake would do well not to repeat too often to promiscuous audiences.

There is little use in trying to predict the more remote outcome of this deplorable situation. It presents such a problem as English statesmanship has never before been called on to solve, and, no matter what way it is solved, Englishmen must pay the penalty of long and now deeply deplored persistence in wrongdoing. For it is now well established that political sins, even of past generations, cannot be atoned for by any repentance, however deep or sincere, on the part of their descendants. They have to be expiated by the loss and suffering and mortification of the children. This is the lesson which the history of the last century in nearly every country has brought out with startling force—in our own among the number.

THE UNITED STATES AND MADAGASCAR.

It would be somewhat ludicrous if our sudden friendship with the Queen and people of Madagascar should get us into a diplomatic quarrel with the French Republic. But, unless we are greatly mistaken, the elements of a lively diplomatic controversy are already at

hand. The Queen of Madagascar claims sovereignty over the whole of that island. But the inhabitants of a part of it refuse to recognize that sovereignty, and are sustained in their refusal by the French Republic, which at this moment has some armed vessels there to sustain its claims by force. Now, the treaty between the United States and Madagascar, which was recently ratified, but the text of which we have not before us, is said to contain in one of its articles a direct and emphatic recognition by the United States of the dominion of the Queen comprising the whole extent of Madagascar. This is directly in the teeth of French pretensions.

Moreover, the clergy of this country seem to be anxious to take part in this interesting controversy by manufacturing public opinion. The Malagasy ambassadors are strong Presbyterians. On Tuesday of last week they were called upon at their hotel in the national capital by a delegation of clergymen representing the Pastors' Union, of Washington. That delegation presented to them a set of resolutions adopted at a "meeting of ministers of various denominations in the city of Washington," setting forth the deep interest with which "the Christian people of the capital of the United States have watched the remarkable progress of the Government and people of Madagascar in civilization and Christianity," and also "that we have learned with deep regret that the peace and prosperity of Madagascar are imperilled by the present aggressive policy of the Government of France, which must, if persisted in, lead to a disastrous war, in which the highest interests of religion, civil order, and education will suffer unspeakable damage." And finally the meeting of ministers "requests the embassy to convey to the Government and Christian people of their country our salutations and sympathies, and unite with Christians in Great Britain and the continent of Europe in earnest prayer to Almighty God, in whose hand are the hearts of men, that this disaster may be averted, and the peace and prosperity of Madagascar assured." In response to these resolutions the chief ambassador, Ravoninahitriniarivo, availed himself of his opportunity to represent the French as waging an unjust, selfish war, a war against civilization and against the progress which had been accomplished in Madagascar. "The French," he said, "seek to pluck us up as tares because we will not grant them greater privileges than those which other nations are contented to receive; but they cannot uproot us without uprooting the wheat also."

The campaign, therefore, seems to be fairly started. M. Roustan, the French Minister at Washington, who has already made his mark as a somewhat excitable gentleman, not entirely inaccessible to the charms of sensational diplomacy, is said to be "in a state of mind" about it. A fortnight ago, when the State Department had arranged an excursion to Mount Vernon in honor of the Malagasy envoys, to which all the members of the diplomatic corps were invited, the French Minister shone by his absence. When the Pastors' Union, of Washington, protest against the assault upon the Malagasy Christians by the pagan French, he may perhaps remember the undisputed fact that in this country the Government cannot be held responsible for such demonstrations, because it has not the means of preventing or repressing them. But when the envoys of a power virtually at war with France are received by our Government with unusual displays of cordiality, and especially when our Government in a solemn treaty formally recognizes claims of sovereignty openly disputed by France, M. Roustan looks upon such things as exceedingly "grave," and we have no doubt his despatches to his Government about this time furnish very lively reading.

But when he has been here a little longer he will satisfy himself that in this country things of this kind usually do not mean very great harm. The American people are not at all anxious for a quarrel with France or anybody else. It may confidently be said that they care very little whether the Queen of Madagascar governs the whole of that island or only a part of it. They would like to extend their trade that way, but it is after all a matter of comparatively small interest to them. They may come to the conclusion that the French are all wrong in their warlike enterprises against the Malagasy Government, and sympathize heartily with the Queen, but they are not at all inclined to undertake the task of setting right every wrong in the world. The State Department may have thought the Queen entitled to the whole extent of the island, and permitted a clause to that effect to go into the treaty, without giving quite as much thought to the meaning of such a clause as it deserves; but while this may not be complimentary, it is also well known that the Secretary of State is not at all in favor of a brilliant and adventurous foreign policy with pyrotechnic displays. He is undoubtedly well aware that the people of the United States want as little of foreign policy as possible. While this Madagascar business, therefore, contains all the elements of a brisk diplomatic scrimmage, the French will not get a real quarrel out of it unless they provoke one by excessive and altogether unnecessary touchiness.

COUMOUNDOUROS.

FLORENCE, March 3, 1883.

ONE of the most interesting visits in Athens used to be to a small, plain house in one of the least frequented quarters of the city, surrounded by dirty, unpaved streets and squalid houses, among which it was noble. The front door stood always open till far into the night; no servant or porter was there, and no one who came rang a bell. The visitor entered, passed through the hall of the ground floor between two casts of the monuments recently discovered on the Street of Tombs, and mounted the staircase to the first-floor antechamber, where stood generally an attendant—not always, however—sometimes a group of Greeks discussing eagerly some topic of the day; but no one noticed the comer until he asked for direction, which the habitués never did. The visitor passed into a long reception room, with a table in the centre, on which were a lamp and a huge pot of tobacco with cigarette papers. Along one side of the room was a row of chairs, along the other a divan, at the end of which, in the corner remotest from the door, was an arm-chair. When the *genius loci* was at home these chairs and this divan were generally occupied by a crowd, motley and democratic, of his adherents and clients, who came there evening after evening and mostly sat in silence from half-past 6 to 10 P. M., and then went away, saying simply good night, to come again the next night and repeat the ceremony. In the chairs, and on the portion of the divan nearest the arm-chair, sat those who had business for the evening. At the other end of the room was a door that opened into a small library, which was also the room for Cabinet councils; and on evenings when the council used to be held there the crowd of clients waited till half-past 8, or thereabouts, when the door opened and a smiling, bowing, good-humored little man came out and passed down to his arm-chair, giving hand-shakes and salutations right and left to all familiars—always the same: imperturbable, jesting, bantering, laughing, gracious to friend or foe, most cordial to the latter if anything; genial, amiable, and, no matter what was happening, apparently at one with fortune. There was a merry twinkle in his eye, a crafty side-look, a curious manner of attention and deference to every one with whom he talked, which was a most subtle kind of flattery to plain people; and when you had talked an hour with him, differ as much as you might with him—violently, abusively even—he was the same imperturbable, genial, cordial man, unmoved by your bitterness and your compliments alike, and you finally came to the conclusion that neither his words to you nor yours to him had for him any meaning whatever.

This little wily, watchful, smiling man was Coumoundouros, a politician who had in him all the making of a statesman except what honesty would have given, but who for twenty years has been the leading spirit of what answers to politics in Greece. He was a man of Messene, and entered political life in the most humble offices and poor. A Deputy, Minister, President of the Council, he has been longer in public life than any man now living in Greece, and too long for his own reputation. He began well, and I remember him when the Cretan insurrection of 1866 brought all the best minds of Greece forward to sustain by any and all sacrifices the struggle, and Coumoundouros took and kept direction of the affair until the King, timid and utterly blind to the importance of the crisis, yielding to any and all diplomatic pressure from certain of the powers, notably Russia, dismissed him, with his Cabinet, and then dissolved the Assembly, which, with such a unanimity as has rarely been seen in Greece, determined to stand or fall with the Ministry. The country was stirred to the furthest corner and entirely in sympathy with the Ministry, and if at that moment Coumoundouros had given the word, King George would have taken the first steamer for Europe. The King had made a *coup d'état* with no one behind him but Bulgaris and the Russian Minister. The excitable Greeks were boiling over, and the King was publicly cursed and insulted. "Why don't you make a revolution and drive him out?" I asked Coumoundouros. "Why? Because Europe has already so bad an opinion of us that if we were to make another revolution they would give us up as unfit for any government. We can't afford to sink any lower in the opinion of Europe." And so, with a three-fourths majority of the Chamber, and a nine-tenths majority of the people ready for any lead he chose to give, he gave up the power, permitted the King to call in Bulgaris to make a new Assembly, to keep Coumoundouros out of which he was outlawed on some trumped-up charges, and compelled to take refuge in a stronghold of his country. Here he was besieged by the troops until the elections were over, excluding him from the new Assembly.

Had he died then, he would have been one of

the heroes of modern Greece. He had so well organized and carried on the insurrection in Crete—though it was begun against his judgment—that it had worn out all the best generals of the Turkish Army. Ismaïl, Mehemet Kiritly, Hussein Avni, Omar, Reshid, backed by 22,000 Egyptian and nearly 100,000 Turkish troops, regulars and irregulars (eighty full battalions of the former having been under the command of Omar), had all come and done their worst, and gone back baffled, worn out, more by Parthian flight than Spartan fighting, and the Turkish Government was in despair. Insurrections were preparing in many quarters, and six months more would have seen the precipitation of the Eastern question, with Greece in the lead. It didn't suit Russia, and the Russian Minister at Athens had orders to stop it unless Coumoundouros would accept the lead of the Czar, and let the Hellenic plans be subsidiary to those of the Emperor. He refused, and was dismissed. Yet so great was the difficulty of meeting the crisis that after the Coumoundouros Ministry had gone out, the Russian Minister, M. Novikoff, came to him and offered to replace the Ministry if he would accept the Russian plans, and they would carry the work on together. Coumoundouros replied that he would never sacrifice the interests of Greece to those of Russia, and refused to treat with a Russian Minister concerning a matter of Greek internal policy. Coumoundouros went into practical exile. Had that ended his political career, he had been a happy man.

He, of course, came back to power as soon as the people were free to elect again, but he came back in some way a changed man, thirsty for power; and thenceforward he bent and truckled and connived at corruption and intrigue till he was the most pliant of Ministers to the corps diplomatique, and the most largely followed by all the rascals and thieves of Greek politics of all the publicists of Athens and the provinces. The next great Greek crisis—that which came on with the conference of Constantinople—found him playing the part which Bulgaris had acted in 1868, while Tricoupis was in his old character of defender of the Greek policy and interests. It happened that I went to see him again when the question of acceptance of the compromise on the frontier question was in the balance, and he said emphatically, sitting in the old arm-chair in that long reception-room, to me on the end of the divan, "Not only my Government, but no other Greek Government, *dare* accept that compromise. I mean war, and we shall fight if Turkey does not yield." Yet, two hours before, he had signed the reply of the Ministry to the diplomatic body accepting the compromise and keeping the peace. It was understood by every one that he acted under the dictation of the King and against his convictions, and, as afterward appeared, his interests. This time it was Tricoupis who refused to assent to insurrection or accept foreign dictation, and when the new elections came Coumoundouros was swept out of power and influence with a unanimity never before seen in Greece. He had typified and exemplified in political life all the worst and some of the best traits of the Greek character, and he fell without a hope of rising again—not so much because he was corrupt as because he had shown himself not to be the clever and far-seeing man the country had taken him for.

M. Coumoundouros entered public life in 1853, and the first notable incident of his career was the burning of the records of the commune under his care, by which he is accused of having profited indirectly—as, indeed, public scandal says he has done all through his public life, so that he has accumulated a fortune which, being mainly in real estate and hence easy to estimate, is known to amount to 2,000,000 francs, though he always declared that it was heavily mortgaged. His good luck is contrasted with that of Tricoupis, who, having begun with 500,000 francs left him by his father, has already spent the half of it in his public service, which no one even in Athens has ever accused of the least shade of corruption. Of Coumoundouros it was said, as has been said of other men in other countries, that he himself never stole, but cared not how much his friends stole. And when a man whose official emoluments were never, as Prime Minister even, above $2,000 a year, accumulated a fortune of $400,000 without ever having been known to embark in any business but politics, the Greeks have a clear right to assume that he profited by his friends' thieving.

TWO BIOGRAPHIES.

LONDON, March 11, 1883.

Two biographies of eminent men have lately appeared which in their several ways have attracted an unusual amount of notice. The first of these is the Life, or rather the third and concluding volume of the Life, of the late Samuel Wilberforce, Bishop first of Oxford and afterward of Winchester. In his own generation—the generation which is now just disappearing—he was one of the most conspicuous and remarkable figures—remarkable not more for the quantity of his powers than for their surprising variety. He was a good preacher and a still better platform speaker, who drew immense audiences wherever he went; moving men, and still more women, not so much by his argument as by his skill in touching the emotions. He was an unwearied ecclesiastical politician, always involved in discussions and controversies, sometimes, it was thought, in intrigues; without whom nothing was done in Convocation, nor, where Church interests were involved, in the House of Lords. In literature he was not idle, for besides producing a Life of his father, the famous philanthropist and abolitionist, he wrote religious tales, and not seldom contributed articles, whose anonymous character was soon stripped off, to the *Quarterly Review*. However, it was as a man of society that his fame was perhaps greatest. He was not merely a brilliant talker, full of anecdotes and ideas, admirably quick in repartee, but also, what many good talkers are not, a most agreeable companion, whose charm of manner could hardly be resisted even by those who came inclined to distrust him. There was a brightness and flow about his conversation, together with a sympathetic way of putting things, which made him more sought after for dinner parties, or as a guest at country houses, than any one else in England. There was probably no other public man, and certainly no other ecclesiastic, who was so constantly in the public eye, whose doings were watched with so much curiosity and excited so much controversy. In spite of his winning ways, he had many enemies; for he was a strong partisan, dealt hard blows, and was deemed, not only by his opponents, but by some of his friends, to be neither straightforward nor trustworthy. His abilities no one could deny. But was he sincere? Was he truthful? Was his ecclesiastical zeal the outcome of real religious feeling or only an engine of personal ambition? Could a man externally so worldly, and at least as welcome among worldlings as to the good, be really pious? These were the questions which the mention of his name never failed to raise, and which were debated with that zest which specially belongs to personal questions. However, even his enemies felt a kind of pride in so remarkable a contemporary; and his sudden death, caused by a fall from his horse while riding over a Surrey down in company with Lord Granville, in 1873, excited universal regret and stilled the voices of censure.

The first volume of his Life, which appeared some years ago, and was prepared by a respectable Anglican canon (since deceased), was dull and decorous. The second excited no great notice, but the third, which has just appeared, the work of one of his sons, has fallen like a bombshell among the ecclesiastical and political circles of London. The Bishop, it seems, kept a diary—another instance of the truth that it is the busiest men who do the extra work of life—and in this diary he recorded a great deal of the gossip which he heard, and which of course related to the people he lived with. The extracts from this gossip which his biographer has given to the world touch up these eminent persons with a freedom quite unusual in English books, however common it has become in English newspapers. Politicians and literary men come in for their share. But the oddest things are those which the Bishop writes, or reports, about his episcopal colleagues, and those more particularly who were preferred to him when the great sees of Canterbury and London were being filled up. In 1868, just before Mr. Disraeli's Government was defeated at the general election of that autumn, the Archbishop of Canterbury died, and Mr. Disraeli, as Prime Minister, had to choose a successor to the chair of Thomas Becket. He proposed a Bishop, still living, who had somehow gained his favor. The Queen, who interests herself a good deal in ecclesiastical appointments, rejected this nomination, and a pretty warm scene appears to have followed, the result of which was that the Bishop of London, Dr. Tait, was transferred to Canterbury, and the Bishop of Lincoln sent in his place to London. Bishop Wilberforce was naturally thought of by his friends for both vacancies, and could not help thinking of himself. Their condolences and his reflections are fully chronicled here, together with a narrative and criticism of Mr. Disraeli's behavior which has been painful reading for that great English party which, while reverencing the memory of Bishop Wilberforce, has erected Lord Beaconsfield into a sort of saintly hero. The whole incident is a curious illustration of the way in which the gravest ecclesiastical affairs are managed in England, and the wonder is that the results of such causes are not worse and more unworthy of a religious body than they turn out in practice.

For a month after this third volume of the Life appeared, we had a running fire in the newspapers of letters denying and complaining of the tales which the Bishop's diary and letters contained. The Archbishop of York, to whom Bishop Wilberforce bore no good will, began; bishops and deans and literary lights joined in, till the reader got the impression that nearly everything in the diary had been impeached. The biographer meanwhile coolly answered that it was his duty to use the materials he found, and that if people only knew how many lively things he had omitted which he might have printed, they would wonder at his self-restraint. The Bishop's reputation has certainly received a shock in the minds of those High Churchmen and Conservatives who chiefly cherished his memory. But those who had distrusted him while he lived have been led to think better of him now. For his diary and letters show that if he was full of weaknesses, ambitious, fond of praise, shifty, he was also warm-hearted, constant in his friendships, unquestionably sincere and earnest in his piety. If there was in him an element of what is commonly called humbug, there was at least no hypocrisy. The effusion of his sermons and confirmation addresses was genuine; and though he passed rapidly from it into an atmosphere of worldliness, this was a part of his curiously variable and impressionable nature, which felt the present keenly and forgot the recent past.

Wonderful, too, is the picture which the diary presents of the man's incessant activity in so many directions. Every day in the year had two or three, often four or five, engagements, many of them engagements which involved speeches or written sermons, and required hours of previous preparation. His whole time was bespoken weeks or months beforehand, and he bore this constant load of work not only without complaining, but obviously enjoying the sense of his own vitality and variety and importance which it gave him. It was such a life as can hardly be led anywhere but in England, where one metropolis gathers all the political and ecclesiastical leaders and all those who make up what is called society; and where people of great note are called upon to bear a part in almost every kind of work, and forced into contact with those who have come to the front in other walks than their own.

The other biography I have referred to at the beginning of this letter is like that of Bishop Wilberforce in one point only, that the career it describes is a typical one, and possible to an Englishman only. It is the Life of Lord Lawrence, the most famous of all those whom England has sent to conquer or rule in the East. He died four years ago, full of years and honors, and was buried in Westminster Abbey, where now a striking bust has been placed over his grave. The Life, which is the work of Mr. R. Bosworth Smith, known to literature as the author of books on Mohammed and on Carthage, is somewhat diffuse, but otherwise very well written. It contains a judicious selection from his letters and despatches, with a powerful narrative of the stirring events in which he bore a part. As a rule, Indian exploits are little known in England. Though the nation is proud of ruling so vast and populous an empire, it knows very little about the East, does not read much on the subject, and imperfectly understands what it reads. Persons who have played a great part in India, and whose merits and faults are perfectly familiar to every European who has lived in India, often remain unknown to the English public, and when they return home are disgusted to find how little they are considered. Lawrence is in our own time almost the only conspicuous exception to this rule. He came from the North of Ireland, whose half-Irish, half-Scotch population has contributed a good many eminent persons to British history. At nineteen he went to India, in the service of the old East India Company, rose through the various grades of office without gaining any reputation beyond that of an energetic and conscientious man, whose work was always well done, and in 1846 attracted the notice of Lord Hardinge, then Governor-General, who sent him to administer a large district in Northwestern India, recently taken from the Sikhs, whence, after the second Sikh war, he passed on to the government of the Punjab, that vast territory, inhabited by warlike tribes and surrounded by dangerous neighbors, which lies between the Indus and the Sutlej. Here his magnificent talents for administration were speedily revealed. He established perfect order through the province, resettled its agricultural system, planned and carried out splendid public works, and, in spite of the expenses of this reorganization, succeeded in raising a considerable surplus revenue. The lately conquered population became contented and loyal, and, while the Governor formed native regiments from among them, he managed to surround himself with a band of subordinate British officials whose like for capacity and energy India had never before known. The result was seen when the great crisis of the Mutiny came in 1857. When the wave of rebellion swept over the rest of Northern and Central India, the Punjab alone remained quiet. Wherever symptoms of danger appeared, they were promptly suppressed by Lawrence and his lieutenants, and suppressed so completely that he was able to strip his province almost bare of British soldiers and military stores, sending all its resources against the rebel army which had seized Delhi. It was, in fact, from the Punjab and by Lawrence that Delhi was recovered and the tide of fortune turned. He was hailed both in the East and at home as the saviour of India, and, after some years, received the honor, almost unprecedented in the case of an Indian civilian, of being named Governor-General.

The great interest of his career, apart from that which belongs to his singularly lofty and simple character, centres in two points, which make him a sort of model for those who are called to rule over inferior races. He took infinite pains to know the natives, and did succeed in acquiring an extraordinary knowledge of them, their ideas and habits. He lived among them in his earlier days almost as one of themselves, constantly traversing his district in the saddle, and deciding their disputes in a patriarchal sort of way. And he combined unshrinking firmness with the most scrupulous justice, gaining by the display of these two qualities a reputation which made him feared and respected by the natives over all India as few Europeans have ever been in the East. The English Empire in India rests more upon the personal ascendancy of the ruling race than upon material force; and this ascendancy was in his case acquired not by any single exploit, such as those of Clive, but by the impression, derived from his peaceful though energetic administration, of an inflexible will and an equally inflexible rectitude. He was as near an approach to a hero as it is possible for official life to produce; and he retained to the end of his days the truly heroic virtue of perfect simplicity. No contrast could be greater than between this externally grim and severe, yet really genial and warm-hearted, man, with his Spartan manners, blunt and unadorned speech, his directness, his tenacity of purpose and consistency of ideas, and the bright, witty, eloquent Bishop, fond of display, of novelty, anxious to be all things to all men, dazzling his contemporaries, but leaving no mark either on the literature or in the history of his country. Y.

MARIVAUX.—II.

PARIS, March 1, 1883.

THE relations of Marivaux with the philosophers form a curious chapter in the literary history of the eighteenth century. Voltaire was in Paris on the 8th of June, 1732, the day of the first representation of the "Serments indiscrets," and he wrote to M. de Fourmont, to whom he announced the bringing out of this play: "You may be sure that there is much metaphysics in it, and little *naturel*: the *cafés* will applaud, but honest people will understand nothing." In the famous "Pucelle," Voltaire speaks with contempt of the

"Vers de Danchet, prose de Marivaux."

Marivaux took his revenge when he could. "M. de Voltaire," he once said, "is the perfection of common ideas"; and again, "M. de Voltaire is the first man in the world for writing what others have thought." But Marivaux had a generous nature. When, in 1735, Voltaire's 'Lettres philosophiques' had made their appearance, a bookseller, knowing the feelings of Marivaux, asked him to write a refutation of them, and offered him five hundred livres—a large sum for the time. Marivaux refused. Voltaire, hearing of it, wrote a letter very flattering to Marivaux: "I should be sorry to count among my enemies a man of his character. I respect his *esprit* and his probity. There is in all his works a character of philosophy, of humanity, of independence; it is true that I sometimes wish for a style less *recherché* and for more noble subjects," etc. The bookseller offered double the sum to Marivaux, and Voltaire for a moment became very much alarmed. He was very nervous; he lost his temper. "Let this miserable man gain money, like so many others, by throwing insults at me; it is just that the author of the 'Voiture embourbée,' of the 'Télémaque travesti,' of the 'Paysan parvenu,' should write against the author of the 'Henriade.'" Voltaire was needlessly alarmed, as Marivaux had refused again, in the most decided manner, to make a refutation of the 'Philosophical Letters.'

This was all the more meritorious in that Marivaux did not share the views of Voltaire; he had a liberal mind, but he had retained religious sentiments—he did not like the intolerance of the philosophical school; he laughed at the "esprits forts." One evening, at Madame de Tencin's, Bolingbroke, who was at the same time very irreligious and very superstitious, made a great profession of anti-religious ideas. "If you do not believe," said Marivaux to him, "it is not for want of faith." At another time, a discussion took place before Fontenelle and him as to the nature and essence of the soul. Somebody asked Fontenelle to give an opinion. "You are wasting your time," said Marivaux; "M. de Fontenelle has too much *esprit* to know more than I do myself on the subject." He once said: "I only know that the soul is spiritual and immortal, and I know nothing more." It will not surprise those who live in 1883, that the expression of such ideas required some courage in Marivaux's time, in a society completely imbued with the ideas of the philosophers. Helvetius was a materialist and an atheist, and he was among the most intimate friends of Marivaux. "I like my repose," said Marivaux to Madame de Tencin, "and I respect the repose of others." He avoided quarrelling, but he could not avoid criticism; he bore it more patiently than Voltaire and Montesquieu and Beaumarchais. The eighteenth century had great powers for fighting; it is full of the battles of the Desfontaines, the Frérons, the Marins. "Everybody," said Marivaux, "has his own delicacies of self-love; mine go so far as to believe that some people cannot even offend me." Once, however, Marivaux was obliged to give blow for blow. Crébillon, *fils*, the too celebrated author of 'Tanzaï et Néadarné' (Paris, 1734), a novel full of allusions to Cardinal de Rohan and the Duchesse du Maine, parodied Marivaux in a novel called 'L'Écumoire.' Crébillon, in this licentious novel, imitated the subtle style of Marivaux. In his 'Paysan parvenu,' Marivaux took his revenge, and criticised the manner of Crébillon, the license of the 'Sopha,' the bad use he made of his natural talent. This page shows that, if he had taken the trouble, Marivaux could have been an excellent critic and a dangerous polemic.

Marivaux consoled himself for his ruin in the best society; he was the constant guest of certain literary salons. Some of his contemporaries accuse him of having had too nervous a sensibility. Grimm, who was always severe, says of him: "The most innocent words wound him, and he easily supposes that people wish to mortify him." Collé says that Marivaux needed to be treated like a woman, constantly flattered like a young beauty. D'Alembert says that he was touchy, but as ready to pardon as to take offence. President Hénault, who was probably the best and the most impartial judge, says that Marivaux was a little "pointilleux." A little susceptibility did not deprive him of a number of

charming qualities. His conversation was original, witty, in the style of his writings. He was not very *naturel;* he had a great horror of commonplaces. Sainte-Beuve justly says that "there is a certain public, a certain order of minds, on whom the ingenious *harcellement* of the lovers of Marivaux can take no hold." It was probably so with his conversation; but he had his own public, and he has it still.

Marivaux remained to the end a man of the world; the world was his study, his school, his inspiration. He was neat in his dress, fond of an elegant simplicity; he liked the society of women. At Madame de Lambert's and Madame de Tencin's he was almost at home, as well as Fontenelle; he was also a constant guest at Madame du Deffand's. He was not so much at ease at Madame Geoffrin's, as she was a little too tyrannical. Toward the end of his life, he was often seen at Madame du Boccage's. Marmontel tells us, in his amusing memoirs, that there was always a circle round him. Madame de Tencin was very devoted to him. Piron, in some light verses sent to her on New Year's Day, says:

"Tenez-vous en de grâce à vos sept sages,
A Mirabaud, Mairan, Boze et Duclos,
A Fontenelle, Astruc et Marivaux."

At the age of fifty, Marivaux did not yet belong to the French Academy, though La Chaussée, Destouches, Danchet were "immortals." He was too modest, too proud, at the same time. Madame de Tencin and Fontenelle at last succeeded in overcoming his resistance, and he became a candidate in 1742, on the death of the perpetual secretary, the unknown Abbé Houtteville. Madame de Tencin began the campaign. She wrote to the Duc de Richelieu, who had a great influence over Louis XV. The name of Voltaire having been pronounced (he did not, however, come forward openly as a candidate), a great quarrel began between the *dévots* and the philosophers. Marivaux was elected unanimously, but there was a great shower of songs and of satires against the Academy. D'Alembert tells us that it was commonly said in the *cafés* that "Marivaux would have been better placed in the Academy of Sciences, as inventor of a new idiom, than in the French Academy, the language of which he did not understand." In the *Journal de Police,* which follows Barbier's Journal, we read:

"Pour couronner ses travaux,
Fontenelle met Marivaux
A la célèbre Académie;
N'a-t-il donc tant vécu que pour cette infamie?"

Voltaire was at the head of the cabal. Was it not horrible that the doors of the Academy should not have opened themselves at once to the author of the 'Henriade' and of 'Zaïre'? Voltaire was not yet, in 1742, the great god of the eighteenth century. Marivaux took no part in the great quarrel; he really felt that too much honor had been paid him. He took his seat on the 4th of February, 1743, and was received by the Archbishop of Sens, Languet de Gergy. The Archbishop was obliged to speak well, in the name of the famous company, of comedies which he was supposed never to have seen and of novels which he was supposed never to have read. He did not play his part well: he contented himself with speaking of the private qualities of Marivaux; he praised his amiability, his modesty; he criticised a little his "marivaudage"; he said such things as these: "Those who have read your works say that . . . the celebrated La Bruyère seems to live again in you. . . . Such are the ideas, I am assured, which are spread in a number of writings, of novels, of comedies, of amusing pamphlets, which you have given to the public with a prodigious fecundity." The Archbishop blamed Marivaux for having given descriptions of the passions of mankind, which, in his opinion, were always dangerous.

"I have learned," said he, "that you proposed to yourself as your object a wise morality, inimical to vice; but, on your way, you stopped often at tender and passionate adventures, and, while you propose to yourself to combat licentious love, you paint it with such candid and tender colors that you make on your reader an impression different from what you wished to do—your descriptions are so natural that they become seducing. The ingenuous picture of human weaknesses is more apt to awake passion than to calm it. Whatever may be your precepts, a young man will acquire from your descriptions more taste for vice than your morals can inspire in him for virtue; and your 'Paysan parvenu,' who is carried to fortune by his intrigues, will in vain preach a modesty and a reserve which he has not practised."

This singular eulogy (and I have only given a small part of it) put Marivaux quite beside himself; he was on the point of asking immediately some sort of reparation of the Academy, but, fortunately, he kept his temper. When we read now the 'Paysan parvenu,' it is impossible to deny that there was some truth in the remarks of the Archbishop. We cannot, certainly, classify Marivaux as a licentious author; but if we study the history of the French novel in the eighteenth century (and there can hardly be a more interesting study), we see that from Lesage and his 'Gil Blas' to the indecent novels of the end of the century, there is a continuous march toward immorality. Marivaux, with his 'Marianne' and his 'Paysan parvenu,' the Abbé Prévost, with his 'Manon Lescaut,' are, unconsciously, the predecessors of Duclos, of Crébillon, *fils,* and of Rêtif de La Bretonne.

Madame de Tencin did not content herself with making Marivaux an Academician: she gave him an apartment near Saint-Roch, near her own hôtel; she took care of him as of a child. He had nothing to live upon but the product of his pen, and he could say with Marmontel: "The man who makes shoes is sure of his wages; the man who makes books is never sure of anything." He was unpractical, and somewhat indifferent to his own fate. When he lost Madame de Tencin, he was obliged to accept Madame de Pompadour as a benefactor. The favorite had doubled his pension of fifteen hundred livres. Marivaux did not know at first that he owed this augmentation to her; he found it out by an indiscretion of Voisenon's, and the discovery was very painful. He spent his last years with the philosophy of a Christian philosopher; he lived with an old friend, Mlle. de Saint-Jean. He died almost in obscurity, and the journals of the time take no notice of the event. Grimm gives only a few cold lines to it. Posterity has placed Marivaux in the forefront of the second-rate dramatists; he comes immediately after the group formed by Corneille, Racine, Molière. He has qualities which have been found inimitable. His place will always be preserved in what we call the "répertoire" of the French theatre. His strange idealism; his elegant unreality; his imaginative and dreamy turn of mind; his dialogue, which reminds one of the conversations of birds or insects in an enchanted garden; his exquisite art in the analysis of chaste, noble, and restrained passion, will always give him a chosen place in French literature.

Correspondence.

THE SETTLEMENT OF MARYLAND.

To the Editor of The Nation:

Sir: In last week's *Nation* (No. 923) President Magoun, of Iowa College, accuses me of "following the old exaggeration" about the preponderance of Roman Catholic influence in the early settlement of Maryland, and makes the curious suggestion that my paper on "The Migrations of the American Colonists," in the *Century Magazine,* could hardly have been written after the publication of Doyle's 'English Colonies' and Bancroft's "Last Revision"! But the well-guarded statements made in that article in regard to the Maryland settlement—which statements Dr. Magoun cites in a fragmentary and rather exasperating way—were founded upon the original authorities. Of these authorities, I do not see that either Mr. Bancroft or Mr. Doyle has any monopoly.

I am not concerned to prove that the Catholics were more numerous than the Protestants among the emigrants, but that "in its motive and mainspring the *first* Maryland settlement was Roman Catholic." If Dr. Magoun doubts this, let him take the cautious, but very explicit, statement of the motive of his expedition put forth in the "Declaratio" of Cecil, Lord Baltimore, himself:

"First, and especially, in order that he may carry thither, and to the neighboring places, . . . the Light of the Gospel and of the Truth."

And further on:

"The first and most important design of the Most Illustrious Baron, which also ought to be the aim of the rest, who go in the same ship, is, not to think so much of planting fruits and trees . . . as of sowing the seeds of Religion and piety."

When a Roman Catholic speaks in this vein, we are warranted in saying that the motive and mainspring of his action are religious—that is, Roman Catholic.

The controversy is by no means a new one, nor is it one that will be settled by passages from Bancroft's "Last Revision"—certainly not by President Magoun's absurdly irrelevant citation from Doyle. This is one of those unhappy historical questions that have become entangled with religious prejudices; and as the records are pretty meagre, it bids fair to be debated to the end of time. In 1866, the Rev. Ethan Allen, D.D., published an able paper in the *American Quarterly Church Review,* setting forth more strongly than my critic does what may be called the Protestant side of the question, though it is pitiful to have to confess that there is a Protestant and a Catholic side to what should be merely a question of historic fact. A recent paper by the Rev. E. D. Neill, which I cannot find in the New York Historical Society's Library, and of which my own copy is out of my reach at this writing, presents the evidence on Dr. Magoun's side of this question more completely than any other document I know, and presents the very testimony upon which Mr. Bancroft probably has based the statement cited in Dr. Magoun's letter.

But when we consider that the *first* settlement—and it is explicitly of the first settlement that I spoke—contained no clergymen but Jesuits; that the various parts of the ship were put under the protection of God, the Virgin, St. Ignatius, and all the guardian angels of Maryland (*omnium angelorum Marylandiæ*); that Father White, in prayer during a storm, declares the purpose of the voyage to be "to raise up a kingdom for the Saviour"; that the colony was named for a Catholic Queen, who was already objectionable to Protestants; that islands, promontories, and rivers took on the names of saints, so that even the Potomac masqueraded for a brief space as "St. Gregory's"; that a mass was said and a cross erected at the first landing, there can be no doubt that the Catholic was the dominant influence. That the Lord-

proprietary, Governor, and Secretary of the province—the latter appointed some years after the settlement—were Catholics, will not be denied. I do not say that the Protestants were all, but that they were "*for the most part*, people of no great consequence, and without strong religious convictions and purposes." The fact that they lived in Maryland for sixteen years without a clergyman is sufficient evidence of the truth of this proposition. They may have outnumbered the Catholics at the start, and they certainly did out-count them a short time afterward, and in their number were included some men of station; but proprietary and official influence, and an unflagging zeal in proselyting, made Roman Catholicism powerful and successful while Maryland Protestantism remained yet little more than a name.

I write this letter at a great disadvantage: all my notes and references are two hundred miles away; but I see no reason to doubt the soundness of my conclusions in regard to Maryland. On reading over the Jesuit Relation of 1656, I am not sure but that in a single point I am inexact. Without consulting my notes, I cannot be sure that the phrase, "sending one of them in irons to England," on page 731 of the magazine, is a mistaken reference to the disposition made of Father White, which took place after Ingle's invasion. If so, it is one of those inaccuracies which seem inevitable even with most vigilant writers of history, and which, though quite unimportant in their reference to the main question, are nevertheless humiliating.

EDWARD EGGLESTON.

MARCH 15, 1883.

BACON AND SHAKSPERE.

TO THE EDITOR OF THE NATION:

SIR: In Mrs. Henry Pott's lately-published edition of Lord Bacon's 'Promus,' the lady—evidently a most industrious and intelligent scholar, whatever we may think of her theory—makes much of the fact she alleges, that "the forms 'good-morrow,' 'good-night,' 'bon-jour,' now seem so commonplace that without these notes to draw attention to them it would probably not strike any one that they were new in the time of Shakespeare, still less that they were of Bacon's introduction; yet this appears to be the case." And elsewhere Mrs. Pott enlarges upon this singular theme, going so far as to say, in one place, that these "forms of salutation . . . were, so far as can be ascertained, unknown here three hundred years ago." At the end of her book Mrs. Pott gives a list of nearly six thousand works that have been carefully read, "with a view to ascertaining whether or not the literature of the fifteenth, sixteenth, and seventeenth centuries contains all or any of the turns of expression, similes, proverbs, *morning and evening salutations*, quotations, etc., which are entered in Bacon's 'Promus.'" Among the writers quoted in this list is Chaucer, all of whose poetical works are mentioned by name. Yet, without going far, the following lines come to the memory (they are all taken from "The Knight's Tale"):

> "The besy lark, the messager of day,
> Saleweth in hire song the morrow gray."
>
> "There n'as no good day, ne no saluing."
>
> "And home went every man the righte way,
> There n'as no more, but farewel, have good day."

The first of these quotations would seem to imply the existence of a general custom, of which the other two give particular illustrations.

On page 47, in connection with the same subject, Mrs. Pott mentions the word "Albada," noted by Bacon in the 'Promus,' and does not seem to be aware—though I apologize for the suggestion—that it is the original of the French "Aubade"=a morning serenade, just as "Alba"=the dawn, from which it is derived, is the original of the French "Aube." Littré quotes Villon for the use of "Aubade."

At the risk of making this communication too long, I would add that I do not find the resemblance between the following two passages—the one in "Hamlet," the other in Montaigne—pointed out by any of the commentators on Shakspere; but, though it be a trifle, may it not be worth noting?

"*Hamlet* [to *Polonius*]. My lord, you played once i' the university, you say?

"*Polonius*. That did I, my lord, and was accounted a good actor." ("Hamlet," Act iii., sc. 2.)

"I have under-gone and represented the chiefest parts in the Latin Tragedies of Buchanan, Guerenti, and of Muret; which in great state were acted and plaid in our colledge of Guienne: . . . and my selfe (without ostentation be it spoken) was reputed, if not a chiefe master, yet a principall Actor in them." (Montaigne, Essays, Book 1, 'Of the Institution and Education of Children,' Florio's Trans., 2d ed., 1613.)

In the sentence that introduces the passage in Montaigne, quoted above, there are turns of expression, and something in the sense, that recalls the Advice of Hamlet to the Players. "Shall I," says Montaigne, "account or relate this qualitie of my infancie, which was a kinde of boldnesse in my lookes, and gentle softnesse in my voice, and affabilitie in my gestures, and a dexteritie in conforming myselfe to the parts I undertooke?"

The edition of Florio's Montaigne I quote from is the second. The book first appeared in 1603, and it is in a copy of this first edition, now in the British Museum, that Shakspere's name is written; and whether he owned this particular copy, and wrote his name in it with his own hand, or not, we know, from *Gonzalo's* speech in "The Tempest" (Act. ii., sc. 1), that he had read the essay, "Of the Cannibals." And although Florio's translation was not published until 1603, the year in which the First Quarto "Hamlet" appeared, yet, as was common enough at that time, the MS. may have circulated for some time previous to its publication. The passage I have quoted is differently worded in the First and Second Quartos. The Second Quarto was published in 1604, and in this the passage is settled in its present accepted form.

In the long list of authors quoted by Mrs. Henry Pott in her recent edition of Lord Bacon's 'Promus,' Florio is, strangely enough, not to be found. Nor is the 'Arcadia' of Sidney mentioned, though his Poems and Sonnets are. But Florio's Montaigne and Sidney's 'Arcadia' offer vocabularies rich in Shaksperian words and turns of expression, and would well reward the miner for his search.—Truly yours, C. C.

NEW YORK, March 17, 1883.

WOMEN'S INTEREST IN PUBLIC AFFAIRS.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* notices the complaint of "C. P. W.," in *Lippincott's*, "that a woman will abandon herself with painstaking assiduity to the study of early Italian art, . . . and lapse into a state of placid speechlessness if some subject is introduced into conversation like the latest election, the defeat of Arabi, or the Irish troubles"; and adds that "the type of woman who will discuss matters of the same kind and in the same way that men do . . . is still to come." All which is very true; and it might further say that the feminine type suggested never *will* come till women, like men, are made to feel that they have a personal interest and responsibility relating to the administration of public affairs. Whenever, as in notable instances in England and France, women have had the opportunity to wield political influence, they have readily mastered the situation. But the great mass of women grow up with the feeling that they have nothing to do with public affairs, taking what political opinions they have unquestioned from father, brother, or husband. And when, as time goes on, these props are removed, they are left floundering in helpless bewilderment, incapable, to a great degree, of apprehending the bearing and significance of current events, and thus debarred from intelligent discourse upon them.

The woman, indeed, who reads but one newspaper, and pins her faith to it, will chatter all day without doubt or misgiving; and it is "C. P. W.'s" "intellectual" woman who is perplexed. So long as she reads only the *Tribune*, she thinks she understands the tariff; but when she takes in the *Nation* and Professor Sumner, she is all afloat; and so with numberless other questions. Men, accustomed all their lives to consider these things, and forced to practical decision, and who have daily opportunity to discuss them with other well-informed men, can have no idea how difficult it is for most women to know what to believe respecting passing events and present issues, to evolve *the truth* amid conflicting sources and statements. What marvel that her fancy

> "Seeks
> Some solid ground to rest upon,"

and delves into the most abstruse and recondite themes if they only rest upon an assured foundation? That women, under such circumstances, choose to hold their tongues rather than discuss matters they do not understand, shows a reserved power which has not been credited to them, and *almost* demonstrates their ability to understand such matters if they fairly gave their minds to it. What they need is a stronger motive than mere desire for information—a sense of *personal obligation* that will make them feel that they have patriotic as well as domestic, social, and religious duties. The woman's-rights advocates claim that a *ballot* in their hands will furnish the stimulus, but cannot goad them on to demand and use it, and all their arguments and appeals from the standpoint of right and privilege have had far less obvious results than a simple suggestion from Mrs. Doremus. The appeal to duty and Christian obligation has enrolled multitudes of women in efficient organizations, reaching into the most distant corners of our own land, carrying Christian institutions and influences into thousands of heathen homes, and at the same time marvellously developing and strengthening the women engaged in them. And when the right chord is touched, and these conscientious American women are thoroughly convinced that their participation in public affairs will tend to the good of the nation and the maintenance of its institutions, we may be sure that they will rise to the occasion, and heartily carry forward what they see to be their duty. And when that time comes, they will be able to discourse upon public questions, even if not "in the same way that men do." E. D. L.

MARCH 15, 1883.

THE AMERICAN SCHOOL IN ATHENS.

TO THE EDITOR OF THE NATION:

SIR: The opening of the American School for classical studies at Athens is a most praiseworthy effort to free American scholarship from a charge to which it has been only too justly liable.

It is a fact, which none can deny, that the study of classical archæology has not received

enough attention from American scholars, whatever may be said in explanation of such neglect, and however much some may be disposed to question the utility of such study at all, or the propriety of spending American money for such an object. To the Archæological Institute of America, as the *Nation* has justly observed, is due the entire credit of initiating this movement, which has already received the hearty approval and coöperation of many of our best institutions, and which, it is most earnestly to be hoped, will be generously and promptly sustained by all true lovers of classical studies in America.

The energy and zeal with which Professor Goodwin has set to work, the personal inconvenience and annoyance to which he has patiently submitted, and the sacrifice of time, strength, and money which he has so cheerfully made, in the performance of this task, are beyond all praise, and can be fully appreciated only by those who know Professor Goodwin and have had some experience in the ways of the East—who have been so imprudent and unsophisticated as to try to do anything quickly, cheaply, and well, in these lands of the eternal "to-morrow," foreordained backshish, and that exasperating refuge of lies and carelessness, "it does not make any difference." It is superfluous to say that the School has been organized, and set agoing, with the hearty good-will of all who are able to appreciate its object, or near enough to see what has been accomplished. There have been weekly readings, by the students, of carefully prepared papers, on Wednesdays; weekly translations, by Professor Goodwin, from Æschylus, a self-imposed task, on Fridays; while on Saturdays, for some time, the whole school together made visits to the principal points of interest in and about Athens—Professor Goodwin himself, or some one of the students who had made special study of these points, acting as cicerone for the day. Any one who can return to the study or teaching of the classics, after such exercises as these, and not have his interest in them greatly stimulated, might as well despair of ever feeling an increased interest in anything.

It would be unreasonable to compare an enterprise so young with the long-existing French and German sister institutions, and unkind to criticise too closely an arrangement which is confessedly only temporary and tentative. The object of this letter is to do neither the one nor the other, but only to make some remarks which, it is humbly hoped, will be of some little use in exciting an immediate and increased interest in the institution, and to offer, at the same time, some suggestions which may help its founders somewhat in the further and more perfect organization of the same, and the attainment of their most worthy object.

Of course, earnest efforts should be made to secure, so soon as possible, sufficient money to buy or build a suitable house in which not only, as now, the director should live, and a room be furnished for the library, etc., but also some rooms be available for the use of the students. This last will be a desirable addition. Both the French and the German school have a few such rooms, and any one who knows anything about the conditions of living in Athens is aware how very different these are from what one finds in Germany for instance—how hard it is to find lodgings at all in the most desirable localities; how dear they are in the hotels; and how poor the accommodations elsewhere. It is almost impossible to get into a Greek family. The testimony of all students, past and present, will be unanimous on these matters. The building at present occupied is in many respects, as to situation and size, at least, a most desirable one, and, so long as a house is to be rented, it would be exceedingly unfortunate to give it up; possibly it might be the best one to buy. The Greek Government, however, would, no doubt, gladly give a lot for the erection of a building, if that was thought most desirable and the funds were on hand.

But a far more important matter than this is the securing at once of money enough to employ, or at least begin to prepare, a permanent director, or one who shall hold the position for a term of years. Professor Goodwin, who is by general consent a grammarian of the very first rank, has always insisted that he was not a professional archæologist; and we cannot readily believe that he knows less on this subject than most of those who will be likely to succeed him. Yet archæology, embracing geography, topography, architecture, inscriptions, pottery, and numismatics, is *one* of the branches which the School has, or should have, prominently before it, not, however, to the depreciation of literature and art; and it is the one branch which can be studied with especial advantage at Athens or in Greece. In the departments, however, of art and archæology, Prof. Goodwin has often confessed himself to be "a blind leader of the blind." This was naturally to be expected of any American professor up to this time, even the most accomplished, and is pardonable *during the first year*. But should one of the students remain next year, or in any future year—which is not only not impossible, but probable, on the present rotary, Democratic (or Republican lately deceased) system—the new director might not find it very pleasant to be confronted each day with a young man seeking his assistance or advice, who knew more than he did, or at least was not quite so blind as himself.

Aside from this, however, the School would, without such permanent direction, not only never be able to do anything real, or worthy of comparison with the other schools, in archæological research, but it would have at the head of it a series of gentlemen who would be the first to confess that they were neither able to teach others anything about art and archæology, nor even themselves capable of deriving full benefit from a stay in Athens without some assistance and special study of these subjects.

Familiarity with archæological literature in French, German, and Greek is to be presupposed in such a director, but a moderate ability to use the modern Greek practically is absolutely indispensable, unless he is to be placed at the mercy of servants, guides, or his newly-made friends, all which implies a waste of time and money, and a degree of dependence and obligation which it is not pleasant to contemplate. It would, no doubt, be a grand thing for the professors of all these coöperating colleges (and others, too) to have the benefit of a year's study and travel in Athens and Greece, and it is to be hoped that they will still be permitted to come on the present plan; but assuredly they will not profit less by having some one to assist them in that branch of the work with which they will of necessity be somewhat unfamiliar.

The first, most important, and indispensable thing, then, to make the School a success, by the example of existing schools, common consent of its friends on the ground, and common sense of those who are not, is a permanent director, or co-director, who shall give continuity to the life of the School, who shall have given special attention to the study of art and archæology, and who shall be able to speak modern Greek, be familiar with the names of places, men, and things, and whose past experience shall be a treasury, or sort of reserve fund, for the School upon which each fresh company of indigent Americans may draw at sight. Possibly the man for this position would have to be prepared by a year or two in Germany, but it is to be hoped that as little precious time will be lost as possible. The plan here advocated is not a change of the present one, but only a necessary supplement to it. Without such a director, whose services will extend over a term of years, the School will inevitably become, after a few years, ridiculous in the eyes of all whose opinions are worth consideration. For it will look like children at play planting sticks in the sand and pulling them up every five minutes to look at the *roots*, and the few students who pass through it will be the first to condemn it as a useless piece of machinery.

There is also large room for liberality in the library. A good beginning has been made, and the comfort and convenience afforded the students by this alone would warrant all the expenses so far incurred for the School; but still, a great deal of valuable time is lost running around to the German, French, and Greek libraries to secure books they need, and which they should find in their own. Is there not money enough in America among the friends of the School to correct this too? These evident deficiencies in an excellent enterprise it is confidently believed will not long be left unsupplied by American liberality. It is not a distinguishing feature of our countrymen, at home or abroad, to allow themselves to be outstripped by others in anything that money and enterprise will do, still less to fall into contempt for the lack of anything that money can buy.

It would also, perhaps, save no inconsiderable embarrassment, criticism, and pain to future directors if it was distinctly understood that the traditions of our American colleges in regard to the Sabbath, which are fortunately uniform, should be followed here. As is well known, European habits and customs differ in this regard radically from our own, and Greece is ahead of all other Continental countries in Sabbath desecration. Not only are balls given on the Sabbath, but it is not thought improper for students and professors with their wives to attend them. The School would usually be invited to these, at the Palace and elsewhere, as a body, or, at least, the director as a representative. Now, while one director might not on principle object to accepting such an invitation, and, in his private capacity, feel at liberty to do so, another might find himself unable to do so, and obliged to refuse. Some confusion and misunderstanding would be sure to arise from such inconsistent action. Some of the students have had to *act* such refusals already, for themselves, under circumstances in which to make an explanation would have been very awkward, if it was not impossible. It is to be hoped that the School will not have many friends who would care to see this unanimous tradition of our colleges trampled under foot.

Having already encroached too largely upon the space of your valuable paper,

I hasten to subscribe myself,

A Well Wisher.

Athens, February 22, 1883.

THE LOUISIANA PURCHASE.

To the Editor of The Nation:

Sir: I have before me the 'Histoire de la Louisiane,' by M. Barbé-Marbois, with the map referred to by General Walker in his letter to the *Nation* of last week. The map and the accompanying text would seem to close this discussion regarding the limits of Louisiana on the west forever and beyond a peradventure, but not as apparently suggested by General Walker. Upon page 311 of the 'Histoire' M. Barbé-Marbois writes concerning the want of precise definition of limits in the treaty:

"Il importe en effet de ne pas introduire dans les traités des clauses ambigues; cependant les plénipotentiaires américains ne firent plus d'ob-

jections ; et si, en paraissant se résigner à ces termes généraux comme à une nécessité, ils les trouvèrent en effet préférables à des stipulations plus précises, il faut convenir que l'événement a justifié leur prévoyance. *Les côtes de la mer de l'Ouest n'étaient certainement pas comprises dans la cession, mais déjà les États-Unis y sont établis.*" (The italics are mine.)

This not only expresses clearly what the French Plenipotentiary believed he was doing, or, rather, what he was not doing, but explains the legends upon the map. The colored area comprises, as indicated by its legend, the "addition to the United States by the treaty and by its effects"; its effects being the occupation by the United States of the "contiguous unsettled territory" on the west of the purchase. The purchase and the effect thereof are then separately defined by the two subordinate legends, the former of which, as quoted, defines the purchase as extending to the 110th meridian (which, in the crude condition of geographical knowledge fifty-five years ago, may have been supposed to roughly outline the Mississippi basin on the west) ; and the latter—"territories and countries occupied by the United States, following the treaty of cession of Louisiana"—defines the region which fell into our hands, not as a part of the purchase, but, to a certain extent, as a natural result of it.—Very truly yours,

HENRY GANNETT.

WASHINGTON, D. C., March 17, 1883.

GOETHE'S "EAGLE AND DOVE."

TO THE EDITOR OF THE NATION :

SIR : In Conway's 'Emerson at Home and Abroad,' recently noticed by you, a chapter which takes its title from Goethe's poem, "The Eagle and the Dove," contains a translation of that poem in which the last few lines, conveying its point, are so rendered as completely to invert their sense and that of the poem itself. The last line Mr. Conway makes to read thus :

"O Wisdom, ever thou speakest as a dove."

In the original, the word "wisdom" is an ironical ejaculation, followed in all editions—I have in hand four—by a mark of exclamation ; the English word "ever" has no German equivalent, but is inserted quite gratuitously ; and the word "thou" is addressed, not to Wisdom, but, in derision, to the silly bird who could find contentment in a bush.

Goethe is gone, and his memory should be protected. As Carlyle reminded others, he was "not in the least a spooney." Neither was Mr. Emerson.—Yours, B. B.

BROOKLYN, March 12, 1883.

Notes.

D. APPLETON & Co. will shortly publish two English works: 'Retrospect of a Long Life,' 1815–1883, by S. C. Hall; and a 'Glossary of Terms and Phrases,' by the Rev. H. Percy Smith, one more effort to supplement the common dictionary and the encyclopædia.

Mr. W. W. Newell's 'Games and Songs of American Children,' announced by Harper & Bros., promises to be an original work of no slight interest and scholarship. The same house will publish a collection of short stories by Sherwood Bonner, called 'Dialect Tales.'

Renan's charming 'Recollections of My Childhood and Youth' will be published simultaneously by Calmann Lévy in Paris, Chapman & Hall in London, and G. P. Putnam's Sons in New York.

A series of lectures on 'The English Novel, and the Principle of its Development,' almost the last work of the late Sidney Lanier, is in the press of Chas. Scribner's Sons. They also announce 'In the Shadow of the Pyrenees,' an illustrated book of travel by the Rev. Marvin R. Vincent; 'Music in England and America,' by Dr. F. L. Ritter; a new and extensively revised edition of Dr. S. Wells Williams's 'Middle Kingdom'; and 'Chats about Books,' by Mayo W. Hazeltine, consisting of this writer's book reviews in the New York *Sun*.

Messrs. G. L. Gomme and H. B. Wheatley have undertaken to reprint a series of the chapbooks or penny histories in vogue in the seventeenth and eighteenth centuries, and even earlier, using the earliest editions, with outline representations of their quaint woodcuts (why not facsimile?). They will be handsomely brought out, each complete in itself, with a prefatory note and some editing. Each series will cost a guinea. The first includes The Seven Wise Masters of Rome (Wynkyn de Worde, 1505); Patient Grisel (seventeenth century); Thomas Hickathrift; Mother Bunch of the West (seventeenth century); and Sir Richard Whittington (seventeenth century). The edition is small. Mr. Gomme's address is 2 Park Villas, Lonsdale Road, Barnes, S. W., London.

In our recent notice of 'The Woods and Timbers of North Carolina,' we made an error in regard to the publishers, who are Messrs. E. J. Hale & Son, of this city.

The two latest volumes in the Riverside edition of Hawthorne's works (Houghton, Mifflin & Co.) are 'The Scarlet Letter' and 'The Blithedale Romance,' bound together, and 'The Marble Faun.' Mr. Lathrop's introductions, particularly to 'The Scarlet Letter,' are full of curious personal revelations concerning the novelist. The edition, in twelve volumes, is now half completed.

Miss Gordon Cumming's 'At Home in Fiji,' and Frances M. Whitcher's 'The Widow Bedott Papers,' have been brought out in new editions—the former cheapened—by A. C. Armstrong & Son.

The *Library Journal* for February contains an 'Index to some Recent Reference Lists,' by H. J. Carr, directing to the bibliographical sources of over one hundred prominent topics. In the same issue is begun a department of 'Literature for the Young,' edited by Miss C. M. Hewins, librarian of the Hartford Library Association.

In the *Magazine of American History* for March Mr. De Costa discusses the journey of one of Hawkins's sailors, David Ingram, from the Gulf of Mexico to the Bay of Fundy in 1567–69, and prints Ingram's narrative from the MS. in the Bodleian Library. Mr. A. P. C. Griffin contributes a bibliography of the discovery of the Mississippi.

Mr. T. W. Parsons continues his metrical rendering of the 'Divine Comedy' with the thirtieth canto of the Purgatory, in the *Catholic World* for April.

No. 22 of the Proceedings of the U. S. Naval Institute (January) devotes a hundred pages to a compilation, from official papers, concerning the operations of the British navy and transport service during the Egyptian campaign of last year. It is the work of several writers, and is illustrated with diagrams and maps.

A curious paper on the organization and material of field artillery in the United States Army before the Civil War, by W. L. Haskin, Captain First Artillery, opens the twelfth number of the *Journal* of the Military Service Institution.

The fifth number of the Statistical Abstract of the United States (1882) has just been published from the Government Printing Office. Its tables usually cover a series of years—in one case, as far back as 1830. The topics are Public Revenue and Expenditures, National Debt, Customs and Internal Revenue; Banking, Currency and Coinage; Imports and Exports; Production; Immigration; Shipping, Area, Population; Postal Service; Population; Education; Railroads; Agriculture; Coal; Petroleum.

"Maternal Schools in France" and "Technical Instruction" in the same country are described in the two latest circulars of the Bureau of Education.

'Local Government in Michigan and the Northwest,' by Edward W. Bemis, has just been added to the Johns Hopkins University Studies in Historical and Political Science, edited by Mr. Herbert B. Adams. It is the fifth in this instructive series of monographs.

Director J. T. Gardiner's report of the New York State Survey for the year 1881, with accompanying maps, has been published at Albany.

The extraordinary growth and extent of the industries relating to electricity, directly or indirectly, are exemplified in the second edition of 'J. A. Berly's British, American, and Continental Directory and Advertiser' for 1883 (New York : George Cumming). This large octavo volume opens with a summary of the year's progress in electrical development, gives many useful tables and formulas, and then classifies alphabetically the tributary arts and trades. The large membership of the British Society of Telegraph Engineers and Electricians; the management, capital, etc., of telegraph and telephone and electric-light companies; the rules of fire risks; a summary of patents—also come within the scope of the Directory. The American portion has been well done. The advertisements are, of course, a valuable addition to a work of this character, and are very abundant.

Architects will be interested in two forthcoming publications of Bernard Quaritch's, London, viz., 'Examples of Carved Oak in the Woodwork of Ancient Houses, chiefly of the Sixteenth and Seventeenth Centuries,' by William Bliss Sanders, whose original sketches have been photolithographed; and a posthumous work of George Edmund Street's—'Christ Church Cathedral, Dublin,' being the restorer's own account of his proceeding, with an historical sketch of the cathedral by its precentor, Edward Seymour. This last will be an *édition de luxe*. Mr. Quaritch is also publishing in parts 'The Butterflies of India and Ceylon,' a descriptive handbook, with illustrations.

Specimens of the late Dante Rossetti's work as a designer are given in black and white in the April number of Cassell's *Magazine of Art*.

Among the last batch of books *indexed* by His Holiness we find Mme. Henry Gréville's 'Instruction morale et civique des jeunes filles' and Paul Bert's 'Instruction civique à l'école.' No person, whatever may be his age or rank, can hereafter publish, or read, or keep these works in any language, but must deliver them up to the ordinary or to the inquisitors, under the penalties prescribed in the index. The French bishops are accordingly now holding up Paul Bert's text-book "à la défiance et à l'horreur des chrétiens."

Dr. Elliott Coues is still engaged with apparent success in what may be called the reconciling of science and paganism. His lecture on "The Dæmon of Darwin," in which the transubstantiation of matter from the corporeal to the spiritual state is imagined, and the bearing of the theory of evolution on the Platonic philosophy is discussed in a dialogue between Socrates and Darwin in the world of spirits, was, we observe, lately delivered in Boston under very respectable auspices.

Some years ago the deposit of the copies of books required by the Copyright Law was made

in the Clerks' offices of the United States District Courts. The consequence was that it was very difficult to find out whether any particular book had been copyrighted, and the books deposited in so many different hands were said to have been not always kept with scrupulous care; moreover, the required deposit was not always made. A change took place, and now the Library of Congress receives everything. France still prefers the old system, with occasionally curious results. It is a not unfrequent habit of French publishers to print their works in parts in two or three offices in different parts of the country, either because they find it cheaper or because they can get a large work printed more quickly, or to be sure that the printers do not strike off some extra copies to sell themselves. Now the law exacts the deposit, not from the publisher, but from the printer, so that the sous-préfecture of Meaux may receive one end of the volume, and that of Nogent-le-Rotrou may receive the rest from another office. What chance there is of the preservation of these detached sheets, often without any author's name upon them, and sometimes without even a running title, may be easily estimated.

We have already referred to the approaching sale at auction of the Toscanelli gallery, perhaps the most interesting private collection of early Italian, especially Florentine, pictures in Florence. It is catalogued on the *lucus a non lucendo* principle—so eccentrically, indeed, that no value whatever can be attached to the names appended to the pictures; but there are several signed and authenticated pictures of great interest for the history of art, among which are two little pictures attributed to Masaccio, but more likely of his school, others attributed to the Memmi, Orcagna, Gaddi, Lippi, etc., etc., over some of which many battles will be fought as to the attribution. But the genuineness of the works as of the epoch to which they are referred is generally out of question, and no sale has probably taken place in our time of so large a number of works of early Italian art.

The daughters of John Sterling would like to have copies of any American editions of his 'Poems and Sonnets,' or information as to when and where they were published. The books or any statement in reference to them can be sent to the editor of the *Nation*.

—Some weeks ago we made from the *Neue Freie Presse* a translation of a letter addressed by Mr. Darwin in 1873 to Mr. N. D. Doedes, of Leeuwarden, Holland. Through the spontaneous courtesy of this gentleman we are now enabled to present the great naturalist's *ipsissima verba*. They are as follows:

"It is impossible to answer your question briefly; and I am not sure that I could do so even if I wrote at some length. But I may say that the impossibility of conceiving that this grand and wondrous universe, with our conscious selves, arose through chance, seems to me the chief argument for the existence of God; but whether this is an argument of real value, I have never been able to decide. I am aware that if we admit a first cause, the mind still craves to know whence it came and how it arose. Nor can I overlook the difficulty from the immense amount of suffering through the world. I am, also, induced to defer to a certain extent to the judgment of the many able men who have fully believed in God; but here again I see how poor an argument this is. The safest conclusion seems to be that the whole subject is beyond the scope of man's intellect; but man can do his duty."

—We have received from Mr. Elliot Stock, 62 Paternoster Row, London, the first three numbers (January-March, 1883) of the *Folk-Lore Journal*, published by the Folk-Lore Society, and gratuitously distributed to its members. The form is very pretty, and the typography open and inviting, and the contents already insure an ample return to the subscribers. The leading contribution, not yet completed, is the Rev. James Sibree's translation, with running commentary, of extracts from the Rev. Louis Dahle's 'Specimens of Malagasy Folk-Lore,' a work published on the island of Madagascar in 1877 in the native tongue. The samples here given of Malagasy eloquence, imagination, poetry, and song, cannot fail to deepen the interest just awakened by the political imbroglio with France. In the January number we remark Mr. H. C. Coote's interpretation of the Roman practice of breaking up statuary for the foundation of buildings. He regards it as a modified survival of the barbarous custom, observable among many peoples, of sacrificing a human being and burying the body in the foundations in order to give stability to the structure. He cites a number of corroborative illustrations; *e. g.*, the Rumanians bury a rod or stick of the length of the unattainable victim. In the February number Mr. James Britten reports some Irish folk-tales, of which the second, "The Miller and the Cat," is identical with a Norwegian story in Moe and Asbjornsen's collections. In the March number, Mr. William George Black treats of "The Hare in Folk-Lore," and is to be envied because he has evidently yet to make the acquaintance of Br. Rabbit in 'Uncle Remus.'

— The death of the late Mr. Wordsworth, the last son of William Wordsworth, is likely to have an indirect influence upon the reputation of the poet which will cause no little sensation in literary circles. Southey once said that "poets nearly always found their best advisers among their female friends," and cited the instances of Wordsworth and his sister as a remarkable case in point; but it has never yet been realized to how great an extent the gentle lake poet was really indebted to his sister for his poetry. There were, however, in the possession of the Mr. Wordsworth who has recently died a whole cabinet full of MS. letters; some from the hand of his father himself, but the greater proportion of them written by the other members of that little college of authors who did so much to dignify the name of literature at the beginning of this century—Southey, Rogers, De Quincey, Lamb, Coleridge, and Sir Walter Scott. The evidence of these letters, it is asserted, goes to prove incontestably that a great portion, perhaps the greater portion, of Wordsworth's reputation as a poet should be in justice transferred to his sister Mary. She it was who, in the majority of instances, supplied the sentiment, and in many cases the diction also, of his poems; and certainly from internal evidence alone it would be easy to find in the tenderness and softness of the Wordsworthian muse corroborative traces of a female hand, while for external evidence these MSS. must be allowed an authority far superior to any other records, traditional or documentary, which bear upon the question, and before long the public will have an opportunity of judging for themselves of the validity of the case against the poet. The late Mr. Wordsworth was too jealous of his father's reputation to publish these records, which could not fail to damage it; but the present Mr. Wordsworth is equally anxious that justice should be done to his grandaunt, even at risk of discrediting his grandfather. Some time ago arrangements had been made by Mr. Gordon Wordsworth and another member of the family for the careful collation and annotation of the precious documents with a view to publication, and now the work will probably be pushed on with energy. It will of necessity be some time before the entire mass is ready to be given to the world; but when the letters are published they will make a volume which can scarcely fail to occupy a notable place in the history of literature. Just as in astronomy a star has often been regarded for centuries as a single body until the evidence of a stronger telescope has shown it to be double, so "the poet Wordsworth" may henceforward be recognized to be a "twin-star"; and if England loses by the forthcoming disclosure half a poet, she will gain a new poetess.

—Apropos of Wordsworth and the Lake District, we have before us a number of documents issued by the Derwentwater and Borrowdale Defence Fund. It appears that a slate-quarrying concern has taken the preliminary steps to obtain of Parliament the right to run a narrow-gauge railroad, chiefly for mineral but also for passenger transportation, from Braithwaite, in Cumberland, about three miles from the outlet of Derwentwater, to the top of Honister Pass. The route lies along the west shore of the lake, and then follows up the Derwent through the wild and beautiful Borrowdale, and will involve extensive cutting of the precipitous sides, as well as disturb the peace of the valley and seriously imperil those who drive along the adjacent steep highway. It is felt in England that this spot at least is sacred, both from its unmatched beauty and from its literary and historic associations. A committee has accordingly been formed to coöperate with the Commons Preservation Society in resisting the granting of a charter. The three names at the head are Tennyson, Browning, and Ruskin; and by way of securing pecuniary support in this country, also, an American member has been found in the person of Prof. George H. Palmer, of Harvard College, who, we presume, will receive and account for any contributions to the fund that may be sent to him.

—We talk much about the future of American literature and the prospects of American art. Here is a foreshadowing of the future of American architecture. "The Truaxes' planing mills at Walkerton are turning out material for ready-made houses at a rapid rate," says the London (Ont.) *Advertiser*. "Orders for a whole row of houses can be filled in a few days, and it is not uncommon to see an entire street sent out on a train. Next spring the enthusiastic house-builders expect to receive orders for entire villages, after this style: 'What is your lowest figure for five stores, two wagon and two blacksmith shops, one Methodist and one Presbyterian church, twenty-five cottages, a town hall, and a lock-up, to be delivered July 1?'" It is easy to imagine the "entire street," each house exactly like its neighbor, and the "whole village," made, of course, from one design. This is in Winnipeg, to be sure, but the *Northwestern Lumberman* asks why a similar industry should not be established at Minneapolis, Duluth, or any other lumber point in the Northwest. If it is, European travellers will find more uniformity than ever in the land of equality.

—There is at Hebron a mosque so venerated by the Mussulmans that only one European, the architect Pierotti, has ever been allowed to enter it. Beneath it is a tomb ascribed by very ancient tradition to Abraham, Isaac, and Jacob. Of course no Christian now knows anything about it. But in 1119 Hebron was in the hands of Frankish monks, one of whom discovered a cave and obtained of Baldwin permission to make a search. After some days' work, they found a passage about thirty-five feet long leading to a circular hall which would hold forty persons. In the wall of this the canon Arnould discovered a stone which, though like the rest in form, was not cemented and could be moved. This let them (on the 25th of June) into a chamber with an earthy bottom in place of rock. Here, after two days' search, they discovered the bones of Jacob. In an inner chamber which

was presently found were the bones of Abraham and Isaac. How they knew them apart, and how they knew them to be the bones of the patriarchs, is not said. Perhaps they had no other proof than the tradition of their burial in this place. Behind what they chose to regard as the tomb of Abraham were a mass of bones and inscriptions, which they could not read. The relics, after being carried in procession for the veneration of the faithful, were apparently restored to the tombs, where they may still lie. Arnould and his companion, Eudes, wrote an account of their discoveries, and in the fifteenth century a copy was taken in a manuscript that has survived in a library which is not named in the account before us. M. Riant has received a transcript of the manuscript and laid it before the Académie des Inscriptions. It suggests to scholars a possible source of new knowledge of the early history of the country. The bones of the patriarchs might rest in peace if the Academy could only procure rubbings of those inscriptions!

—Reginald Stuart Poole, as Honorary Secretary of the Egypt Exploration Fund, published in the *Academy* of February 24 and March 3 statements concerning the identification by the Fund explorer, M. Naville, of the site of Pithom, one of the two "treasure cities," more properly "store cities," built by the Israelites in Egypt for the Pharaoh of the oppression (Ex. i. 11). Pithom, the Patumos of Herodotus, and Thum of later Greek geographers, is explained by Egyptologists to signify *abode* (*pa* or *pe*) *of Tum*, the Egyptian divinity representing the setting sun. The name was common to several cities, including An, or Heliopolis. The site of Pithom was sought, however, east of Heliopolis, inscriptions indicating the existence of a Pe-tum situated in the district of Thuku, "at the entrance of the East." Ebers located it first at the western end of the Wady et-Tumilat, near the now famous Tell el-Kebir, but subsequently yielded to reasons adduced by Brugsch for locating it further east, north of Ismailia; Thuku being identified by the latter Egyptologist with the Biblical Succoth, the place of the first encampment on the route of the exodus. M. Naville conjectured Pithom to have been situated between the places indicated by Brugsch and originally by Ebers, and, following the advice of M. Maspero, began his excavations at the mound called Tell el-Maskhuta, a few miles west of Ismailia. The site, with its thick enclosure of crude brick, seemed at first to reveal a fort rather than a town, but a statue of a priest was discovered bearing an inscription which shows him to have been "the chief of the store-house of the temple of Tem [Tum] of Theku [Thuku]." The explorer found this a convincing evidence of the identity of the place with the "store city" Pithom, and in a letter of February 13 thus joyfully reported his success: "Tell-el-Maschuta *is* Pithom; or, in other words, the temple of Tum, in the city or region of Thuku, which Dr. Brugsch has identified with Succoth." On February 19 he communicated a fresh discovery, confirmatory of the identification. He had found at the mound a Roman *milliarium*, indicating the distance of "Ero"—evidently the Hero of the Itinerary of Antoninus—from Clysma, or Suez. He had thus discovered that the store city of which the sacred or temple name was Pe-tum, or Pithom, and the civil name Thuku, or Succoth, was the Heroöpolis of the Greeks and Romans, a name which he now easily traced to its Egyptian source: "Ero would be the transcription of Ar [Ari or Aru], which means the store-house, and which is found on the statue of the priest." Heroöpolis, thus explained, simply signifies *store city*. Mr. Poole is delighted with this discovery, and thinks "we may reasonably hope soon to gain some positive evidence of the dates of the oppression and the exodus," having "found the very walls on which the enslaved Hebrews worked." Bible critics of a more sceptical turn of mind will deem this a very sanguine hope, believing that at best—that is, if the identification is fully confirmed—M. Naville has only found walls on which the enslaved Hebrews of the story of Exodus are *related* to have worked.

—MM. Oppert, Halévy, and Lenormant, at a late meeting of the French Institute, pronounced the characters found by Mr. Stillman engraved on the stones of what he considered the remains of the Labyrinth of Gnossus (Reports Am. Arch. Inst.) to be probably proto-Assyrian. They recognized the sign for "God," and another which signifies the plural number. Supposing, as Mr. Stillman does, this work to be of the Dædalian epoch, and the dynasty of Minos to indicate the earliest arrival of the Asiatic civilization in Crete, symbolized by the rape of Europa (personification of an Asiatic religion) by Zeus (the peculiar deity of the Pelasgic races), the result of which combination was the dynasty of Minos (a name which, like that of Pharaoh, probably applied to a family, as it recurs at dates separated by several generations), the attribution of the French savants would accord as nearly as anything may with the date to which Mr. Stillman assigns the work. The scantiness of the inscriptions at present makes definite conclusions impossible, but there is evidently an indication, in this recognition, of an interesting field of research, which it is to be hoped the obstinacy of the Turks will not prevent from being opened.

—The January number of Petzholdt's *Neuer Anzeiger* is of unusual general interest. It begins with a biographical sketch and a bibliography of Professor Zöllner, of Leipzig, the physicist, whose explanation of spiritualism by the geometry of four dimensions has brought his name more before the public than his strictly scientific writings would have done, though they were numerous enough (Petzholdt enumerates eighteen books, and alludes to numerous articles in scientific journals and transactions). In the February number is a postscript of four pages, adding two more titles, and mentioning two other works that were partly printed at his death, one of them a new edition of his 'Natur der Cometen,' the other 'Ein Beitrag zur deutschen Judenfrage.' This latter, a thick volume, is a collection of sketches of noted Germans, intended to show, in opposition to those who have lately insisted upon the number of German Jews, or Jews of German descent, or friends of Jews who have reached eminence, that there are quite as good and great men of undoubted German origin who are equally worthy to be held up as models for true Germans. At which the dispassionate foreigner will be inclined to sing, "Which nobody can deny," and yet to doubt whether it affords any solid justification for a *Judenhetze*. The next article, "Index librorum prohibitorum," is a list of books locked up as dangerous in a south-German library in the fourth decade of this century. Of the sixty-seven titles many are forgotten now, and one can only guess at the cause of sequestration. But it is not surprising that De Lamennais's 'Worte eines Gläubigen,' Mickiewicz's 'Die Bücher des polnischen Volkes,' Freiligrath's 'Glaubensbekenntniss,' and several writings of Heine and of Börne should have seemed dangerous to sensitive politicians. Probably no one would object to them now—the fight is on another ground; but Germany still has her Index, for the Socialists at least. Presently we meet with some remarks on a little controversy which Professors Schramm-Macdonald and Thamm have been conducting with the usual German amenity. It appears that a year or more ago Professor Thamm reviewed Oettinger's great 'Moniteur des Dates,' and having found a certain number of errors, as was to be expected in a work containing a million of dates, immediately proclaimed the 'Moniteur' to be of no use whatever. It was a foolish remark, and the editor of the 'Moniteur' would have been wiser if he had left it unnoticed, quietly inserting corrections in his supplement. But the late Dr. Oettinger had proclaimed the absolute accuracy of the 'Moniteur' on the housetops, as it were, and his successor, Dr. Schramm-Macdonald, could not resist the temptation to reply in his post-face, on the completion of the work, by allusions to a "kritikaster," "a gymnasium-teacher in Lauban," and to show triumphantly that this criticaster is entirely wrong in his remarks about a certain Lappalie, as if that were the only error pointed out by the Lauban Professor. Here the matter rests; but neither angry disputant can convince us that the 'Moniteur' is not an exceedingly convenient book of reference which ought to be in every library, or that it can be always implicitly relied on.

RELIGION AND PROGRESS.

Gesta Christi; or, A History of Humane Progress under Christianity. By Charles Loring Brace. Second edition. 1 vol. 8vo. A. C. Armstrong & Son. 1883.

Mr. Brace, so well known for his enlightened labors in what may be called preventive charity, has performed a seasonable and estimable work in this volume, and we are pleased to see, from the announcement already of a third edition, that it has met the appreciation which it merits. From a wide variety of sources, he has drawn materials for considering the condition and progress of society from the time of Christ to the present day, presenting almost every aspect of human relations in succession. The book is divided into three parts, devoted respectively to the Roman Period, the Middle Ages, and the Modern Period, and under each he treats of the constitution of families, the condition of woman (including marriage and divorce), the state of morals, slavery and serfdom, the distribution of property, the laws of war, the administration of law, education, international law, and other cognate topics, covering the whole subject with sufficient thoroughness to show how great has been the advance in all that makes life worth living, among those fortunate nations which have accepted the teachings of Christ as their standard in motive and conduct.

Yet, as a contribution to the philosophy of history, the work has defects which greatly diminish its value. With every disposition toward fairness on the part of the author, and with readiness to admit much that bears against his argument, the whole is little more than a special plea. Mr. Brace starts with the preconceived theory that all which is praiseworthy and hopeful in our modern civilization, as distinguished from those which have preceded it, is directly attributable to the divine revelation brought to man by Christ. Of course, the palpable objection to this theory is the fact that so little of this special Christianizing influence has been felt until within the last hundred years—so little that the greater part of the work is occupied with the enumeration of evils that have endured for eighteen centuries since the birth of the Redeemer, and are only beginning to be relieved in our modern times. It is true that the author seeks to meet this by suggesting (pp. 468–70) an analogy between the development of the moral forces of Christianity and the slow evolution of physical nature, and concluding that

"we may, therefore, fairly say that Christianity has merely begun its workings in the world, and many hundred centuries must pass away before it will show any important part of its true influence." Not only is the comparison thus instituted wholly an illogical and misleading one, but the conclusion would seem virtually to give up the question. Man cannot, of course, undertake to set bounds to the plans and purposes of Divine Wisdom, but in a matter involving the whole welfare of the human race he has a right to doubt the soundness of a theory which thus coolly sets aside the fate of the countless millions of human beings who have suffered, and are to suffer, for the lack of these Christian influences; and he may humbly suggest that such a theory is hardly consistent with the idea of a divinely beneficent purpose in revelation and in the tremendous sacrifice of the Atonement.

Moreover, the special pleading to which we allude is shown throughout the work by the manner in which the Church is treated as a thing separate and apart from Christianity. "One must not," he says in the Preface, "confound Christianity with the Church." Yet, what other exponent had Christianity than the Church? The independent action of the laity in religious matters is altogether modern—a thing unknown since the times when the technical "Church" ceased to mean the whole body of believers; and at any period save our own, the outcome and result of Christianity is to be sought for in the Church, its conduct and its teachings. The moral condition of the laity has been but the effect of the efforts of the Church, and by that condition the Church and the religion it professed, considered historically, must be judged. Under Mr. Brace's system, however, he considers himself justified in attributing to Christianity everything which he finds creditable in human development, and to the Church everything discreditable. Certain humble and unknown persons, filled with the principles of the new faith, are assumed (p. 3) to have influenced for good the currents of thought and legislation in spite of the Church. Granting these premises, and admitting the distinction thus drawn between the great body of believers and their authorized exponent, the object of the book proves itself; but this is surely not a scientific mode of treating a most complicated and difficult subject. The fact remains that the Ages of Faith were precisely the ages in which, as Mr. Brace himself shows, the humanizing precepts of the Gospel received the scantiest observance. The Renaissance, which brought about the Reformation, was in many respects a Pagan revival, and yet almost everything which has been gained for practical Christianity has been gained since then—gained, too, in many cases, in spite of the earnest opposition of devoted and single-hearted professors of the Christian faith.

In truth, the mutual interaction of man and his religion is a much more complex subject than Mr. Brace seems to imagine. The factors which contribute to our modern civilization are numerous—some of them plainly visible, and others eluding analysis and only to be conjectured from their results. It is difficult for the wisest to explain the sudden development of humanizing influences which has occurred within the last one hundred and fifty years; certainly the short and simple solution so confidently advanced by Mr. Brace cannot be accepted by any one who has thought upon the subject. Influences which had lain almost dormant for more than seventeen centuries cannot be assumed to have suddenly sprung to life and to have wrought, within a time so comparatively short, changes so beneficial and promising so much in the future.

No thinker, whether he be a believer or not, will underrate the power of religion on man; but no one who has made a dispassionate survey of the great religions of the world can fail to see how much religion is modified by race and time and apparent accident. All the great religions have many features in common—features which are among their best—yet how different have they been in their development and how varied in their results! The Christianity of America is not that of Russia, nor the Buddhism of Tibet that of Ceylon; and all have wandered far in practice from the precepts of their founders. Those founders taught essentially the same doctrines of humanity—so nearly alike that Mr. Brace is tempted (p. 451) to regard Buddha as divinely inspired—but perhaps neither Sakyamuni nor Christ would recognize their followers of to-day. Dogmatic Christianity, especially, has two features which have militated greatly against human progress and the development of the true Christian spirit: the theory of the origin of evil and the doctrine of exclusive salvation. The one makes God responsible for all suffering, and thus renders the effort to relieve it, rigidly speaking, an opposition to God himself—and, however shocking this may seem when nakedly put, it has repeatedly been urged by the orthodox conservative against audacious innovation; the other renders persecution a religious duty, and thus justifies the Crusades, the Inquisition, and the suppression of the freedom of thought. Even the horrors of the African slave-trade found in this their apology (pp. 365, 366), and the wild rhetoric of Victor Hugo's "Torquemada" has its foundation in historical fact. The watchword of irreverent Voltairism—*Écrasez l'infâme*—was not wholly without apparent justification.

Mr. Brace realizes the elevated conceptions of some of the great teachers who preceded Christ, though he fails to do justice to the rabbis of the school of Hillel, who formulated much that we are disposed to claim as distinctively Christian; and he takes no notice of Zoroaster, who founded what is perhaps the most practical body of religious teaching of which man has had the benefit. Had he studied the religious books of Mazdeism, he would probably have modified some of his remarks, such as those relating to cruelty to animals and to the prevention of epidemics; and he might have recognized, from the robust avoidance of all asceticism in Mazdeism, that perhaps the Gospel is not quite so free from responsibility for the ascetic vagaries of Christian practice as he assumes it to be, seeing that Christ makes it the duty of the believer to sunder all human ties and devote himself to the care of his own salvation.

Throwing the last century out of consideration, a Parsi might have little difficulty in drawing a comparison between his own faith and Christianity not very flattering to the latter. In the dualistic theory of Zoroaster, every worshipper of Hormazd was bound to aid him in his conflict with Ahriman by good thoughts, good words, and good works. By restraining his own passions he was striking a blow at Ahriman; by cultivating truth, honor, justice, charity, love, in himself, he was expelling the Daevas, or demons, and welcoming the Yazata, or angel, who was perpetually on the watch to assist him. "If, perhaps, I must give up my body for the sake of my soul, I give it with contentment," formed part of the regular confession of faith, even at a time when Mazdeism had become corrupted with fatalism. But all this was not merely a subjective and ascetic theory. The evil in nature as well as in man was the work of Ahriman, and thus to contribute to its diminution was the highest and most sacred duty, not only by charity to the indigent, by feeding the hungry, and clothing the naked, but by cheerfulness, by thrift, by well-directed and sagacious industry, to promote the well-being of society at large. One of the most noted of the Zoroastrian hymns says: "We give the kingdom to Ahura [Hormazd] when we afford succor to the poor"; and this charity toward the good creation of Hormazd was not confined to man, but extended to the brutes serviceable to man. A legend relates that Zoroaster, in one of his conferences with Ahura, saw a man plunged in hell except as to the right foot, and was told that he was a king who had reigned over thirty-three cities, and who had been guilty of cruelty and injustice, but who once, on seeing by the wayside a sheep tethered out of reach of its food, had pushed with this foot the fodder up to the animal. Useful labor, in the Zoroastrian theory, is not a curse inflicted on man as a punishment for ancestral transgression, but a religious duty, to be performed with contented cheerfulness as man's share in the supreme universal task of rescuing the world from the grasp of Ahriman; while idleness is a sin leading inevitably to hell.

When the Dinkard enunciates the law of the good religion on the duties of kings and rulers, it says nothing as to the building of temples or the maintenance of priest and ritual, but it enlarges upon the religious obligation of removing as far as possible from among men misery, want, hardships, filth, and pestilence. While throughout Christendom hungry priests preached the profitable doctrine that largess to the Church would purchase absolution for a life spent in rapine, the Pazend text sternly warned off all such polluted gifts by attributing the merit of charity bestowed from wrongfully-acquired wealth not to the donor himself, but to those from whom he had plundered it. While Constantine was laboring at Nicæa to reconcile the subtle dogmatic quarrels of Arius and Athanasius, the humble mobed was telling the magnificent Sassanid monarch that the first duty of a king is to see that husbandmen have bullocks and other things needful for the cultivation of the earth; that artisans have implements requisite to their handicrafts; and that women and children, the aged and the defenceless, receive due protection: "The light to crush misery of this description is the light of religion." While the churches of Rome and Alexandria and Constantinople were hastening the fall of a worn-out civilization by eagerly disputing every fragment of wealth and power that they could win from its fears or its weakness, and while hordes of squalid monks in the Nitrian desert were leading lives of abject and self-inflicted wretchedness as the most efficient means of propitiating a benignant Saviour, the Mazdean priest was preaching that the religious duty of princes was to erect hospitals in all cities, to provide them with skilled physicians and all remedial appliances, and to order investigations into the best means of cure. While the self-abnegation taught by Jesus was developed into a system which proclaimed idleness and beggary to be sacred virtues, the Mazdean law-giver was true to his doctrine of the duty of self-supporting labor, and bitterly reproached the professional mendicant—"Always thou standest there, going to the doors of others to beg for food!"—though he held also that "Poverty which is through honesty is better than wealth which is from the treasure of others." While Christian teachers for ages imagined that they magnified the power of an all-wise and beneficent God by proclaiming that war and famine were the direct results of his volition, that the plague and typhoid were his creatures, whose blows should be endured with pious submission, and that to invite disease by squalor and filth was the highest Christian perfection, Mazdean Dualism has taught for

more than fifteen hundred years that "measures of all kinds should be taken in cities whereby the city may flourish and be industrious, and famine and misery and want may be annihilated; also, fire, water, and the earth should be kept fragrant, and the air should be kept pure from all noxious substances and matter liable to decay, so that owing to them man may not suffer from disease and pestilence." While, in the outraged name of a suffering Redeemer, outward conformity with transcendental dogmas was pitilessly enforced with sword and dungeon and axe and faggot, the Guebre held that his religion was weakened by those who professed it with their lips but did not aid it with their good works; and he welcomed as his ally in the struggle with the powers of evil the man whose words condemned his faith, but whose deeds were just and pure. While vicegerents of Christ openly taught the world that faith and oaths pledged to heretics and excommunicates were not to be observed, even the Magi of a corrupted Mazdeism declared that a promise was to be sacredly kept, whether given to the believer or to the infidel, and that its infraction would bring distress upon a whole district.

It is true that enmity to Ahriman logically included enmity to those who, in not worshipping Hormazd, might be classed as Daevayasnians, or Devil-worshippers, but this did not express itself in the fierce brutality of the Crusades or of the Dragonnades. While theology explained that the false religions of the world were the work of Ahriman, a kindly charity stepped in to relieve their followers of moral responsibility, because "every one believes that much, and considers it good, which his teaching in religion has included, and particularly that religion the purest which exists with his government"; and while the unbeliever is not admitted to Garothman, or the highest heaven where Ahura dwells, there are three lower abodes of bliss and splendor which are open to the righteous of all creeds.

Between the principles of one faith and the practice of another it is easy to establish one-sided comparisons such as this, and it would be profitless were there not something to be gained by merely showing how easily they can be made, and how much there is in other religions worthy of respect and imitation. The true Christian is he who can recognize not only the common brotherhood of man, but the common impulse which has led men of all races and in all ages to elevate the moral and material standards of their fellow-men. In this sense, all the great religions are at one, however much human passion and folly have degraded them from their purpose. As the wise Sheikh Baha-ud-din Muhammed Amali says:

"In the kâbah and the fire-temple the perfect saint performed his rounds
And found no trace of any existence save that of God;
As the splendor of the Almighty sheds its rays in every place,
Knock thou either at the door of the kâbah or the portals of the temple!"

We cannot take leave of Mr. Brace without acknowledging how much there is to inspirit in the hopefulness with which he looks forward to the eventual triumph of Christian principles throughout the whole organization of human society. He regards the wonderfully rapid progress of the last hundred years as merely the beginning of what is to lead to the final condition of mankind, when men shall regard each other as brothers, when wars shall be no more, and when sin, and crime, and poverty, and all preventable ills shall be removed, in so far as it can be accomplished by a regenerated and purified human nature. The tendency of his work throughout is wholly good, and it is largely calculated to aid in the result to which he aspires, by showing how much has been already accomplished, and the directions in which further progress can most readily be made.

CLOUGH.

Arthur Hugh Clough: a Monograph. By Samuel Waddington. London: Geo. Bell & Sons. 1883. Small 8vo, pp. x.-333.

THE intention of Mr. Waddington's study of Clough's life and poems is better than its execution. It shows abundant good-will and a competent knowledge of external facts, but it lacks keenness of critical insight and fails alike in vigor and in delicacy of touch. It may be commended to readers not yet familiar with the poet as a compendious and easy introduction to the knowledge of what he was and what he did, and of the esteem in which he was held by his contemporaries. It is interesting as an indication of the ripening judgment of the later generation concerning Clough's position in the galaxy of English poets, and the character of his work as representative of the deeper intellectual and moral tendencies of his time.

The great change—a change unparalleled in its rapidity and extent—in the beliefs of thoughtful men in respect to life and the world which has been wrought in the last twenty-five years, has had the effect of making Clough's poetry seem more truly contemporaneous with the present than with his own generation. He was a forerunner; he felt the breath of the new morning, he delivered with surprising exactness "the earliest messages of light," and he died before the day had fully broken. It is natural that the work of such a poet should receive during his life but scanty recognition and meet with but imperfect recognition from the general reader. In giving clear expression to his own convictions, he shocked deeply-rooted prejudices and prepossessions. He made many readers uncomfortable by the distinct utterance of thoughts which they had partially admitted, but which they desired to quell, of emotions which they had experienced, but from the acknowledgment of which they shrank. It was easy to charge him with scepticism, with inconclusive and unfruitful doubt, with dangerous questioning; and these charges had effect upon his repute. But, as the years have gone on, such scepticism as his has become the mood of many of the most serious minds, such doubts as his have proved to be fruitful of wise inquiry, and such questionings have undermined many of the old supports of error. The term "agnostic" had not then been invented, but Clough was an agnostic in the true sense. So long ago as 1847, he wrote: "Until I know, I will wait; and if I am not born with the power to discover, I will do what I can with what knowledge I have, . . . and neither pretend to know, nor, without knowing, pretend to embrace." And about the same time, in a striking review of Francis Newman's book on 'The Soul,' he said: "Let there be priests, if you please, to preserve the known, and let them, as is their office, magnify their office, and say, It is all. But there shall also be priests to vindicate the unknown; nor shall it be accounted presumption in them to maintain, It is not all."

Such doctrine, familiar enough in our own days, had a strange sound thirty-five years ago; and to announce and maintain it required a sincerity and a courage of rare quality. The position assumed by Clough was not reached without a struggle, the severity of which told on his later years. It involved the sacrifice of what are called his prospects in life, the cooling of the regard of friends, the interruption of many sympathies. Clough was strong enough to endure all manfully, without complaint, but not without suffering. His natural reserve was, perhaps, increased, but his temper did not lose its sweetness, and the serenity of his spirit was undisturbed.

His moral position is displayed in his poems. The sincerity of nature manifest in the formation of his opinions is one of the main qualities of his greatness as a poet. It gave clearness not only to his outward perceptions and observation of conduct, but even more to his imaginative vision. His poetry is essentially poetry of conduct; so far as it is reflective, it is with the reflection of a student of human life and character. The beauty and fidelity of his sketches from nature in "The Bothie," of his descriptions in the "Amours de Voyage," show his fine eye for scenery and the aspects of things; but the scenery of the Highlands or of the Roman Campagna is only the background or stage for the exhibition of character and action. To him nature was, in his own words,

"Fair in itself, and yet fairer with human completing creations."

He cannot withdraw himself from the concerns of men and women. He has been called a philosophical poet, but he is not so in the sense of dealing with abstract speculations and philosophical opinions; it is with the metaphysics of the spiritual, not of the intellectual region, that he is concerned; with the antinomies of doing and not doing, with the perplexities of practical action, with the mysteries of good and evil.

Mr. Ward, in his generally appreciative criticism of Clough's poems, in his 'Selections from the English Poets,' complains that "we find a prevailing indecision in them that injures their moral effect in most cases." But this is to miss the very essence of their worth. The indecision so called is the evidence alike of the sincerity and the sensitiveness of the poet. If there be in Claude, the hero of the "Amours de Voyage," something of "Hamlet-like weakness," it is required by dramatic consistency. Claude is the type of the delicate, introspective, reserved, and conscientious nature, given to questioning, and unaccustomed to action, brought by force of circumstances and of emotions hitherto unexperienced into a position of mental and moral perplexity in which a ruder nature would have cut the knot of difficulty—a procedure which to a character like Claude's would have seemed but a brutal solution. The moral effect is surely not injured by the story's lacking the end which would content the average reader of novels of incident.

If we look at the poems in which Clough directly reveals himself, and not indirectly through dramatic personations, such indecision as we find in them is but the noble hesitancy in respect

"Of a completion over soon assumed,
Of adding up too soon."

There is nothing in them of the weakness and melancholy of Hamlet, and no want of moral decisiveness.

"'Tis better to have fought and lost,
Than never to have fought at all,"

is the sum of their teaching. Clough was, indeed, an idealist, and the irony of the ideal and moral life was present to his imagination even more strongly than that of the practical life. The contrast between intention and performance, the conflict between inclination and duty, the mistakes in choice, the competition of motives—all this he recognized, and in giving such expression to this side of human experience as no other poet has given he exposed himself to the misinterpretation of the trivial or the merely formal critic. "The Latest Decalogue," the poem beginning

"Each for himself is still the rule,"

the lyric in Dipsychus, scarcely to be matched

in pregnancy of wit or excellence of form, that begins

> "'There is no God,' the wicked saith,
> 'And truly it's a blessing;
> For what he might have done with us
> It's better only guessing'"—

these, and other poems of a similar vein, lose nothing of positive significance by the lightness of their touch, and the absence of a drawn-out moral. Clough does not preach to his readers, he does not lay down the law, he does not assume certainty where doubt may legitimately exist; truth is no simple thing to him—it is difficult to find, it is complex and multiplex, and he bids the seekers for it consider carefully the grounds of the faith within them:

> "'Old things need not be therefore true,'
> O brother men, nor yet the new;
> Ah! still awhile the old thought retain,
> And yet consider it again!"

Is this "an indecision that injures the moral effect of his poems"?

Clough had no worldly aims which could set him at strife with himself, and this total absence of secondary motives gives worth to the form no less than to the substance of his verse. He never wrote for the mere sake of writing acceptable poetry; never tried after false effects; and had no sympathy whatsoever for the doctrine of art for art's sake. His art is the expression of what was substantial in his nature. With large and quick sympathies, with keen and tender insight, with delicate and strong sensibilities, with a sincerity of vision, whether applied to himself or to the world outside, undimmed by mists of passion or prejudice, with imagination of a Shaksperian range and depth, and with his powers disciplined by the best culture that his age could give them, Clough expressed as no other poet has done the spiritual tendencies of his time; and the increasing band of lovers of his work may rest assured that posterity will confirm their judgment of its interest and its excellence.

RECENT LAW BOOKS.

A Treatise on Proceedings in Rem. By Rufus Waples. Chicago: Callaghan & Co. 1882.

The Lawyer's Reference Manual of Law Books and Citations. By Charles C. Soule. Boston: Soule and Bugbee. 1883.

A Treatise on the Law of Mechanics' Liens on Real and Personal Property. By Samuel L. Phillips. Second edition, enlarged. Boston: Little, Brown & Co. 1883.

The American Decisions. Containing the Cases of General Value and Authority decided in the Courts of the several States from the earliest issue of the State Reports to the Year 1869. Compiled and Annotated by A. C. Freeman. Vol. XLI. San Francisco: A. L. Bancroft & Co. 1883.

An Introduction to Municipal Law. Designed for General Readers, and for Students in Colleges and Higher Schools. By John Norton Pomeroy. Second edition. San Francisco: A. L. Bancroft & Co. 1883.

THE first work on our list is one of great research and learning, as well as originality. It differs from previous works covering the same field in proceeding upon a fundamentally new classification. Mr. Waples divides proceedings *in rem* into three kinds: proceedings against things *guilty*, proceedings against things *hostile*, and proceedings against things *indebted*. Things belong to the first class, by fiction of law, "when some act is done in, with, or by them, in contravention of some law having the forfeiture of such misused things as its sanction" (*e. g.*, in the Roman law, the noxal action; in modern law, cases of goods and vessels liable to confiscation for violation of the marine or navigation laws); to the second, when they are enemy's property in time of war; to the third, "when, by operation of law, they become liable for the payment of a sum of money, and may be proceeded against without personal citation of the owner as the debtor" (*e. g.*, bottomry, respondentia, salvage, and other liens). Of this classification, Judge Cooley says, in an introduction contributed to the book by him:

"At first, it may strike the mind that this arrangement is rather fanciful than substantial; but this is far from being the case. It has been made as the result of a careful consideration of the whole subject, and because, in the nature of things, it is needful and scientific. . . . Great labor has been carefully and conscientiously expended upon this work, and the illustrative cases have been patiently examined and studied. Where they have not been found satisfactory, the author has criticised freely; but the reader will not fail to perceive that the criticism is the result of conviction, and is not hasty or captious. As the author bears for himself the exclusive responsibility for his criticisms, another may be at liberty to say for him that the learning exhibited in these pages, and the familiarity with the general subject which is everywhere obvious, justly entitle him to express freely his mature convictions."

This is high praise, but not at all too high. Mr. Waples's book is a contribution to legal literature of great value, and will be found, both by practising lawyers and the courts, of the greatest possible use. Historically, we may quarrel with him for insisting that proceedings *in rem* are the outgrowth of a legal fiction. The idea of the guilt of things is a primitive legal or moral conception, long antedating the age of development at which legal fictions appear. We do not know, however, that for the practical purposes of a legal text-book this misconception makes much difference.

Mr. Soule's manual is an invaluable book of reference for lawyers. The work comprehends a list of American reports, digests, and statutes, with brief and valuable notes in regard to editions and peculiarities; lists of the English, Irish, Scotch, and British colonial reports, with notes; an index of authors, etc., which serves "both as an index to the proper names in the first two parts, and as an original list of short titles of the principal law journals and of the elementary works now in use and often cited"; an index of subjects, and an index of abbreviations. Mr. Soule has been at work upon the book for many years, and his task—a gigantic one—has been performed with care, discretion, and accuracy. We can cordially recommend it to the profession; the information it gives can be got nowhere else.

Mr. Phillips, in his preface, is fortunate in being able to make the announcement (unusual in the case of a law-book) that, in the numerous references to his book made by courts of last resort, "in no one instance has any proposition announced by the author been contested." The author has in this second edition made important additions to the work, increasing its bulk about a fifth. The success with which Mr. Phillips has met is due in great part to his refusal to fall into the custom of making a treatise a mere digest of decisions, getting together as many citations as possible, without discussion or exposition. The "true system of law-writing for practitioners," Mr. Phillips very justly said, in his first edition, "indicates a less extensive scope of subject to be treated, and the incorporation of all that is of value to be found in the reports applicable thereto." This is the system which he has adopted. The number of cases cited is not very great, as such books go, but the reader has a comfortable feeling that they are cited sufficiently and correctly, and in such a way that the reader can learn from them what the law is. The subject of mechanics' liens is a difficult one, owing to the fact that, so far as real estate is concerned (and this is by far the more important part of it), it is entirely of statutory origin, and consequently the discussion of the cases involves a continual reference to statutes. Mr. Phillips's rule, to cite the exact language of the legislature "whenever the decision is founded, not on the general principles of law, but on the words of a particular statute," is the only true one.

The forty-first volume of 'American Decisions' contains cases from seventeen different series of reports belonging to the years 1844 and 1845. The very competent editor, Mr. Freeman, has, as usual, enriched it with a great deal of annotation, including long notes on Perils of the Seas, Acknowledgment of Deeds, and Regulations of Railroad Companies, which the practitioner will find of value.

Mr. Pomeroy's treatise on municipal law has established its claim to recognition among lawyers and teachers of law, and it has many merits which no other work of its kind possesses. Mr. Pomeroy's style is a model of clearness, and his familiarity with the best Continental and English works in his own field makes him specially well qualified to treat of the general principles of jurisprudence. The appearance of his second edition ought to be of special interest in this State just now, because of what it contains on the subject of codification. While Mr. Pomeroy is a believer in the possibility of codification, he seems to have a poor opinion of the code adopted by California (where he is engaged in teaching law), which is substantially the same as the civil code that has been so long before the Legislature of this State; and his acquaintance with the practical working of the code in California leads him to say:

"It is perhaps inevitable that the system of codifying the private civil jurisprudence—the common law and equity—shall finally prevail in this country and in England. One fact, however, is true, if any certain conclusion can be drawn from both reasoning and experience. The benefits which are claimed for the system of codification avowedly belong only to a complete code—a code which shall embody the entire existing civil jurisprudence of the State, absolutely all of the legal rules which are recognized as operative, whether originally created by statute or by judicial decision. Such a code should cover the whole domain of civil jurisprudence, so that courts should find in it the source of all their decisions, and should never be obliged to go behind it and borrow a rule from the pre-existing common law or equity. Austin, who is the leading advocate of codification among the English jurists, bases all his reasoning upon such a complete and exhaustive code; but, while holding it up as an ideal, he fully admits the great difficulty of framing a code which shall at all fulfil the conception and produce its anticipated benefits. It seems to me that reasoning and experience alike show that a mere partial civil code—a code which only professes to contain elementary definitions, the most general doctrines, and a few special rules, leaving the great mass of practical rules and doctrines still existing as a part of the common law and equity by its side—is only an additional source of uncertainty and confusion introduced into the jurisprudence of a State."

To those who know what the proposed code is, this is as weighty an opinion against it as has been pronounced in any quarter.

Paladin and Saracen: Stories from Ariosto. By H. C. Hallway-Calthrop. London and New York: Macmillan & Co. 1 vol., 8vo.

ARIOSTO soars supreme among the Italian epic poets of the Renaissance; and their name is legion. He was among the first to break loose from the servile following of the Classics, and compose the most wonderful romantic epic known to literature, the 'Orlando Furioso.' Taking his subject from the Carolingian Cycle

which had been introduced into Italy by the *improvisatori* and street story-tellers and two or three writers of eminence, Pulci, Bojardo, and others, he carried it to perfection in order to amuse the semi-feudal "ladies and chevaliers" of the Court of Ferrara. These compositions, however, were of foreign derivation, and never took a *serious* hold on the people, except as pastime. But, though taking the subject-matter from the Frankish legends, and recasting it to suit the tastes of the Italian courts, Ariosto superadded all the imagery, wit, satire, and irony of his wonderful poetical genius.

Ariosto, however, was an artist—a great artist—but without any strong feelings either of patriotism, morality, or religion; he gave full play to all his poetical fancies, elaborated them in form, diction, and style, but aimed only at an artistic effect, in which his power was marvellous. Like Shakespere, who from the crude novels of Boccaccio, Ser Giovanni Fiorentino, Bandello, Da Porto, took the plots of some of his inimitable plays, Ariosto did not create, but, continuing the story begun by Bojardo, and collecting all the most extravagant stories of knight-errantry, erected a truly extraordinary monument of Romantic art. There is no aim whatever in the poem, beyond that of entertaining his readers, except the glorification of the Estense family, in whose service he was as Court poet. The great merit of Ariosto, therefore, is in neither the originality nor the scope of his poem, but the wonderful artistic treatment of the innumerable episodes. In this he is like an exhibitor of tableaux vivants, shifting one scene after another, without much connection among them, but invariably presenting to the delighted audience new and surprising events. All the heroic and supernatural tales of Charlemagne and his Paladins are brought out as upon a stage irradiated by the electric light of his poetical genius, in episode after episode, beginning with the fair Bradamante seeking her lover, Roger, in the enchanted castle of Atlas, till he is found alive and restored to her by Prince Leo—which is the only connected link of this unconnected story. But the thousand and one episodes that intervene between these two events are so many pictures worthy of the best masters of the Renaissance, from whom Ariosto derived his highest inspiration. Like them, he is thoroughly finished even in the minutest details, leaving no flaw to criticise either in his language, style, or versification; and the delineation of his characters is so perfect that we recognize them the moment they appear on the scene, even when not named. In the versification, above all, he is called the magician, for in the purity of his vocabulary, the structure of his periods, the harmony and melody of his verses, which flow like a limpid, running stream, he surpasses every author of that age, with the exception of Tasso. But this was not attained without enormous labor, for he spent ten years in composing his poem, and sixteen more in polishing it.

In the work before us, the author properly apologizes for the title, 'Stories from Ariosto,' because of the changes which he has introduced in their details. But we object to the title entirely, for the stories were not Ariosto's, but common property, to be found in all the vast romance literature of that period. In narrating these stories in prose, and for the use of young people, the author has merely retained Ariosto's chronological order; but what made the poem one of the greatest epics of the Italian muse—form, imagery, humor, wit, satire, passions—are all gone, leaving only the bare nursery tales, which existed before Ariosto invested them with the halo of poetry. We must acknowledge, nevertheless, that as Charles and Mary Lamb made charming reading for young people out of the plays of Shakspere, so Mr. Hallway-Calthrop has successfully done with these tales of mediæval chivalry. The language and style are chaste, the stories interestingly told, and purified of all original taint of grossness. Young people should be thankful to him for having thus opened the way to a better appreciation in their mature age of the famous poets of the Renaissance.

English Literature of the Eighteenth Century. By Thomas Sergeant Perry. Harper & Bros. 1883.

WHILE we may consider English literature, as a whole, to be an original and continuous intellectual development, yet at no time, or at least at no time since the Norman Conquest, has it been altogether self-determined. We do not here allude to the occasional influences of its neighbors, to transient and superficial reflections of form or color, but to the notable fact that at each of its great productive periods some foreign influence has been visibly dominant. Thus the literature of the thirteenth and fourteenth centuries took, naturally enough, form and tincture from the Norman French; the Elizabethan and Jacobean literature, from the French and Spanish; that of the Restoration, from the French of the *grand siècle;* and that of the Revolution and the eighteenth century from the Latin.

With regard to some of these, it might not be so easy to decide how far the preference was determined by internal, and how far by external causes. At the Restoration, for instance, the reaction in favor of the house of Stuart, and the peculiar relations of the king and court to France, were of themselves powerful determinants; while, on the other hand, just at that time French literature had reached what was admitted to be its culmination of elegance and splendor. But in the case of the literature of the eighteenth century, we have no such influences to balance; and the extraordinary domination of Latin could only have been due to internal circumstances—to something in the Latin modes of thought and expression that was peculiarly in harmony with the thoughts and feelings of the time.

It was an age of moderation and of compromise. The nation, weary of the loyal enthusiasm of the Cavaliers and the sombre enthusiasm of the Puritans, had come to the conclusion that the highest wisdom lay in cool expediency. Nobody felt any very passionate devotion for Low-Dutch William, the insignificant Anne, or the High-Dutch Georges; but it was felt that with them, under the Constitution, the nation was safe. A reasonable *modus vivendi* seemed the highest goal of the truest patriotism. And the same spirit of expediency and security ruled the literature of the time: its most essential requisite and highest merit was that it should be safe, that it should follow correct models, and have plenty of sound precedents. And nowhere in the world could it have found models so exactly to its taste as the Latin writers of the Golden and Silver Ages, themselves the product of similar influences. Hence, what we know as specifically the literature of the eighteenth century is crushed flat under the pressure of Latin; and from Dryden at its beginning, to Johnson at its close, every man of letters moves under the weight of Vergil, Juvenal, Tacitus, Statius, or Claudian, like Dante's sinners under their cowls of lead.

This, to our mind the key-note and *differentia* of that literature, has been well seized by Mr. Perry in the readable book before us, and would probably have been brought forward more prominently had these criticisms not been originally delivered in the form of public lectures, demanding lively and varied illustration rather than close analysis or well-grounded generalization. He sketches, in a slight but agreeable manner, the characteristic features of the preceding age, shows the advance, the domination, and the weakening of the classic spirit, noting, step by step, the changes that came over each great department of letters—in ethical writing, from Addison and Pope to Johnson and Cowper; in the drama, from "Cato" to "George Barnwell"; in the poetry of nature and sentiment, from the pastorals of Pope and Philips to Burns and Wordsworth; in the novel, from 'Colonel Jack' to 'The Vicar of Wakefield.' Attention is called to the first appearance of romanticism, and what the disgusted critics of the day called "the Gothick taste," which, like Faust's *Pudel*, the more they objurgated and exorcised it, grew and swelled the more, until the uncouth, bristling monster filled the whole room and threatened to burst its way through the roof—a hideous apparition to the Classicists then, though familiar enough now.

Mr. Perry has made liberal use (with due acknowledgment) of the works of Symonds, Leslie Stephen, and M. Beljame, whose excellent book was reviewed in our columns at the time of its appearance. He has not himself, that we observe, shed any new light upon the subject, and perhaps, under the circumstances, was not called upon to do so. His mode of treatment strikes us as a little discursive. It was hardly necessary, for instance, to give so many pages to the mediæval *fabliaux* and the *picaresco* romances of Spain, France, and Germany as an introduction to the novels of Defoe and Richardson. Still, the discursions are entertaining, and the book, on the whole, is one that may be read with pleasure by those who are familiar with the subject, and with profit by those who are not. We have noted two or three typographical errors, of which the only one of consequence is "oblige" for "obey," on page 63, second line.

Bullet and Shell. By George F. Williams. Illustrated by Edwin Forbes. Fords, Howard & Hulbert.

As the war recedes, the books relating to it multiply. The fruit of the accumulated leisure of the actors in it ripens and falls in the shape of partial histories, monographs of battles, and personal reminiscences. These are generally attractive in proportion as they reveal actual participation in the scenes they describe. The book before us, however, in spite of its title, gives little suggestion of this. It is a slight and superficial narrative of the career of an officer through the war, in the lively and florid style of a newspaper report. He is made to share in several of the largest Virginia battles, and takes his turn at almost every kind of special duty. Plenty of adventure falls to his lot, with the best positions and opportunities for seeing what is going on. His least hackneyed experiences are as hospital guard and spy, and the performances of a newspaper correspondent are among the most natural and interesting of the story. The humor, which is of the thinnest, is supplied by an Irish corporal whose brogue is given with tiresome phonetics. Some of the loathsome horrors of war are dwelt on with a minuteness which is unnecessary, and most of the description gives a much better idea of the general appearance of army life as seen by a spectator than of the real experiences of the rank and file. The book hardly deals at all with strategy or tactics, and needs, for its full enjoyment, considerable sympathy with the life it describes.

The illustrations are numerous, and much above the ordinary. Drawn in a light, sketchy style, they are generally very true to nature,

and show plainly that the artist copied them from the life instead of trusting to his imagination. Together with the good paper and type, they make the book a handsome and attractive one.

Latin Selections: Being Specimens of the Latin Language and Literature from the Earliest Times to the End of the Classical Period. By Edmund H. Smith, Professor in Hobart College. Boston: John Allyn. 1883. 12mo, pp. 410.

PROF. SMITH has provided a volume which will be of great service in teaching the Latin language and Roman literature, both of which find here abundant illustrations, chronologically arranged. It begins with the Song of the Arval Brothers, and ends with a passage from Apuleius. For instruction in the language, this will do very well; for literature, it ought to be continued, so as to include Claudian, Ausonius, and Boethius. The selections are made with good judgment and taste, and for the purposes above mentioned will serve sufficiently well. If, however, the book is to be used as a text-book for translation, we think them too *scrappy*, too much of the type of "elegant extracts." Here, for instance, are forty-seven passages from Cicero, and five from Sallust; a single extract from Sallust of the length of all these taken together would be as good for the purpose of instruction in the language and literature, while we feel sure boys would read it with much greater interest. The passages are taken from as wide a range as possible: one hundred distinct names are represented.

BOOKS OF THE WEEK.

American Almanac for 1883. American News Co. $1 50.
Beardsley, Rev. E. E. History of the Episcopal Church in Connecticut. 2 vols. 4th ed. Boston: Houghton, Mifflin & Co. $6.
Blake, Mary E. On the Wing: Rambling Notes of a Trip to the Pacific. Boston: Lee & Shepard.
Brockhaus's Conversations-Lexikon. 13th ed. Parts 51-55. New York: L. W. Schmidt.
Conway, M. D. Emerson at Home and Abroad. Boston: J. R. Osgood & Co.
Daudet, A. L'Évangéliste: a Parisian Romance. Philadelphia: T. B. Peterson & Bros. 75 cents.
Demarest, Mary Lee. My Ain Countree, and Other Verses. A. D. F. Randolph. $1 25.
Feuillet, Octave. A Parisian Romance. Philadelphia: T. B. Peterson & Bros. 50 cents.
Freeman, A. C. The American Decisions. Vol. xli. San Francisco: A. L. Bancroft & Co.
Garnett, R. Select Letters of Percy Bysshe Shelley. D. Appleton & Co. $1 25.
Giberne, Agnes. The World's Foundations: Geology for Beginners.—Sun, Moon, and Stars: a Book for Beginners.—Twilight Talks. 3 vols. Robert Carter & Bros.
Gilder, W. H. Ice-Pack and Tundra: the Search for the *Jeannette*. Charles Scribner's Sons. $4.
Giles, C. Perfect Prayer: How Offered, How Answered. Philadelphia: J. B. Lippincott & Co.
Gilman, D. C. James Monroe. Boston: Houghton, Mifflin & Co. $1 25.
Godfrey, Mrs. G. W. Unspotted from the World. Harper's Franklin Square Library. 20 cents.
Gregory, J. M. A New Political Economy. Van Antwerp, Bragg & Co. $1 20.
Griswold, W. M. General Index to the *Contemporary Review*, *Fortnightly Review*, and *Nineteenth Century*. Bangor: Q. P. Index.
Hall, T. B. Modern Spiritualism; or, The Opening Way. Boston: A. Williams & Co. 60 cents.
Harris, J. A. Principles of Agnosticism Applied to Evidences of Christianity. Thomas Whittaker. 75 cents.
Harris, S. S., Bishop. The Relation of Christianity to Civil Society. Thomas Whittaker. $1 25.
Holmes, O. W. The Professor at the Breakfast-Table, with the Story of Iris. Boston: Houghton, Mifflin & Co. $2.
Keble, Rev. J. The Christian Year. [Parchment Series.] D. Appleton & Co. $1 25.
King, E. The Gentle Savage. Boston: James R. Osgood & Co. $2.
Macduff, Rev. J. R. The Story of a Shell. Robert Carter & Bros.
McMaster, J. B. History of the People of the United States. Vol. i. D. Appleton & Co. $2 50.
Markham, C. R. The War Between Peru and Chile, 1879-1882. R. Worthington.
Manuals of Elementary Science. Physiology, Electricity, Zoölogy, Botany, Chemistry, the Spectroscope, Matter and Motion, Geology, Crystalliography. E. & J. B. Young. 30 cents each.
Medical Index: being a Completely-Indexed Note-Book for Students, and for Physicians a General Index and Record-Book. Ann Arbor, Mich.: Joel A. Miner. $3 50.
Meyer, H. A. Critical and Exegetical Handbook to the Acts of the Apostles. Funk & Wagnalls.
Moore, T. W. Treatise and Hand-Book of Orange Culture. Third edition. E. R. Pelton & Co. $1.
Morris, H. S., and Henry, J. A. A Duet in Lyrics. Philadelphia: Dan F. Gillin.
New Index Rerum, for Students and Professional Men. Arranged to Minimize the Labor of Indexing, and to Classify all Indexed Subjects. Ann Arbor, Mich.: Joel A. Miner. $3 25.
Newton, R. Heber. The Right and Wrong Uses of the Bible. John W. Lovell Co. 20 cents.
Nicoll, H. J. Landmarks of English Literature. D. Appleton & Co. $1 75.
Oernler, A. Truck-Farming at the South. Orange Judd Co. $1 50.
Ogilvie, J. The Imperial Dictionary of the English Language. New edition, revised and augmented. Edited by C. Annandale. Illustrated by above 3,000 engravings. With Supplement and Appendix. In four vols. The Century Co. $20.
Oliphant, Mrs. It Was a Lover and His Lass. Harper's Franklin Square Library. 20 cents.
One of a Covey. By the authors of 'Honor Bright.' E. & J. B. Young & Co. $1 25.
Otis, J. Tim and Tip; or, The Adventures of a Boy and a Dog. Harper & Bros.
Page, C. E. How to Feed the Baby. Third edition, revised. Fowler & Wells.
Parallel New Testament, Greek and English. Including the Versions of 1611 and 1881. Oxford: University Press.
Parkhurst, C. H. The Blind Man's Creed, and Other Sermons. A. D. F. Randolph & Co. $1.
Perry, T. S. English Literature in the Eighteenth Century. Harper & Bros.
Phillips, S. L. A Treatise on the Law of Mechanics' Liens on Real and Personal Property. Second edition, enlarged. Boston: Little, Brown & Co.
Picton, J. A. Oliver Cromwell: the Man and his Mission. Cassell & Co. $2.
Pomeroy, J. N. An Introduction to Municipal Law. Second ed. San Francisco: A. L. Bancroft & Co.
Porter, Rose. Winged Songs: An Easter Jubilee. A. D. F. Randolph & Co. 50 cents.

Henry Holt & Co.

HAVE READY:

The Epic of Kings.

Stories Retold from Firdusi. By Helen Zimmern. With a Prefatory Poem by Edmund W. Gosse. 12mo, $2 50.

"The book is charming from beginning to end. A notable addition to the libraries of those who care to know the great classics of the world."—*London Saturday Review.*

"The two stories which transcend all the others in point of human interest are those of 'Rustem and Sohrab' and of 'Byzun and Manijeh.' The second is one of the most exquisite that can be found in the whole range of Eastern invention. It is a love story of the most complete kind. To analyze it would be to spoil it; readers should go for it to Miss Zimmern's volume."—*London Times.*

The Nation.

NEW YORK, THURSDAY, MARCH 29, 1883.

The Week.

In addition to his other troubles, President Arthur has now to appoint a new Postmaster-General. There are people, however, most willing to help him out of it. Perhaps there are too many of them. There is, for instance, Mr. Chauncey I. Filley, of Missouri. Several successive Presidents have been dying to make him Postmaster-General, but every time some trifle intervened, and then they appointed somebody else. That Mr. Filley is the best man for Postmaster-General is a fact, for he has said so himself. According to his own testimony, in his own handwriting, "he combines a superior order of business talent, practical information, and acquaintance with systematic methods, and fertile originations and quiet execution." He is also "unyielding in principle and unswerving in the execution of trusts, and has never sacrificed the public or political interests to self, but on the contrary, self for them." He is also "a great planner." As we know all this upon Mr. Filley's own authority, it is no wonder that Mr. Filley has it telegraphed from Washington to St. Louis that now, Mr. Howe's death having made a vacancy in the Postmaster-Generalship, he has a sure thing of it. But there is also Mr. Frank Hatton, Assistant Postmaster-General, and editor of the Washington *Republican*. Mr. Hatton, being an inveterate Stalwart, is rather severe upon the civil-service reformers as impracticable dreamers and very improper persons generally. But now he thinks it would be an unscrupulous violation of civil-service reform principles if, instead of promoting him to the first place in the Post-office Department, the President preferred some "outsider" to him. His promotion would indeed serve great public ends, for there is no telling how much a judicious management of that department might help the circulation of Mr. Hatton's paper, the Washington *Republican*. And besides, nobody would show more skill than this same Mr. Hatton in circumventing the civil-service rules in order to put Stalwarts into place.

The present political situation has some very odd features—a period of party dissolution, or what is called "a transition period," always has; but no such period has ever had an odder feature than the tendency of reformers or revolters to select candidates of doubtful antecedents as their champions. It would probably puzzle the closest student of politics or human nature to say what craving of the reformers' nature General Butler satisfied in Massachusetts. We say the reformers' nature, because we are bound to suppose that those Republicans who voted for Butler really meant reform. They were not dissatisfied with the old Republican régime through pure "cussedness." They must have felt that there was something wrong with the government of the State which voting for Butler would help to cure. But why should Butler seem to anybody to have anything remedial about him? For what virtue in politics or society does he stand? What abuse did he ever extirpate? What bad tendency in politics did he ever oppose? What is there in his life or character which anybody who was ever drawn into the Republican party by its principles would be likely to admire? There can be only one answer to each of these questions. There is no reform in or about him, and the reformers who voted for him must have done so as a huge joke. Here in this State dissatisfaction similar to that which prevailed in Massachusetts last fall showed itself in a very aggravated form, but it did not find vent in a piece of bouffe. We voted for an obscure man, it is true, but for a serious man, whose career in such public offices as he had filled indicated that he would be likely to fill higher ones with credit.

The Rhode Island malcontents seem now to be in a fair way to follow the example of their Massachusetts brethren. The selection of Mr. Sprague as the head of a reform movement has somewhat the same humorous touch as the selection of Butler in Massachusetts. It would be impossible to say what process of amendment in human affairs Mr. Sprague represents. His association with the industry of the State has not been a fortunate or improving spectacle. If he has valuable ideas about politics, he has hitherto kept them to himself, and his career is hardly more inspiring than Butler's. So that his nomination and election also, if it takes place, will really have to be set down as a political debauch. It must be admitted that both sprees are rather discouraging. It is not cheering to see the people of two New England States apparently bent on "having some fun" with their highest office by delivering it for even one year to "the boys." It is not possible, whatever people say, to have only one year of a man like Butler in the Governorship. The odor of Butlerism will hang round the office long after he leaves it. The mere fact that such a man can get such an office, long remains as a lesson or suggestion, with plenty of mischief concealed in it. American humor is an excellent article, and is having a great run of success at home and abroad, but it is sometimes out of place. The American mind is not quite prepared to use it with discretion—that is, to take what it wants of it and no more; or, in other words, has not learned how to cover a thing with ridicule without any loss of respect for it.

The past week has been remarkable for the fluctuations of the money market. The stringency which has been gradually increasing for some time culminated about the middle of last week. Rates for mercantile paper had advanced from 1 to 1½ per cent. in the previous fortnight, and the rates for call loans on stock collaterals on the Stock Exchange had gradually advanced to 14 and 15 per cent. per annum, even touching 25 per cent. one day last week. The tightness in the money market had caused a large decrease in the mercantile demand for foreign exchange, and rates for exchange had declined below the gold-importing point. The effect of this condition of things was to draw a considerable amount of gold to this country from London and Paris. From the 16th to the 24th there was received in New York about $3,000,000 of gold, while about $1,500,000 more is on the way. Last week it was also announced that the Treasury would begin the prepayment of the April interest on the public debt, amounting to $7,000,000, and on Tuesday, the 27th, $2,000,000 was paid out of the Sub-Treasury in this city on that account. The combined effect of the arrivals of foreign gold and the payments of the Treasury was to cause a decided change in the money market, and on Tuesday call loans on the Stock Exchange dropped to 6 and 7 per cent. The rates for discount of mercantile paper have only been slightly reduced as yet, but the prospect now is that with the payment of $7,000,000 April interest and $15,000,000 on May 1 for called bonds, and from $30,000,000 to $40,000,000 of pensions during the next three or four months, together with some further imports of foreign specie, the money markets of this country will be plethoric in May.

The comparative ease in the money market and the prospect of an increase of money have not affected the stock market, which continues extremely dull. The speculative spirit seems to be almost entirely absent, not only among the general public, but even among the usual operators of the Street. The general conditions are certainly in favor of higher prices. The present prices of stocks are acknowledged to be very low, the freight movement and passenger travel on the railroads were never better at this season of the year than they are now, and rates of freights and fares were never so high; and yet there seems to be no movement to buy stocks, but rather a disposition to wait until some forecast can be made as to the character of next year's crops. If the month of May should show a fair prospect for a good wheat crop, not only will there undoubtedly be an important advance in railway shares generally, but all mercantile and business enterprises will experience an unusual stimulus.

Dorsey was put on the stand in the Star-route trial on Monday, and contradicted Rerdell at many points. Some excitement was caused by Mr. Merrick's asking the witness how far he regarded an oath as binding upon his conscience. The question brought Mr. Ingersoll to his feet at once, and he delivered an impassioned address on superstition and the Dark Ages, in the course of which he declared that he, Mr. Ingersoll, regarded Truth as the most sacred of all obligations, but that if called to testify as a witness in court, he would be obliged to admit that he did not believe in a personal God. He also denounced the Inquisition, and recalled the cruelties practised by it with the rack and the thumbscrew, but said very

little about Dorsey. After hearing Mr. Merrick the Court decided that Dorsey was a competent witness, and could testify like any other witness, under the pains and penalties of perjury. Of course this does not preclude a cross-examination on the subject of his religious belief, nor as to Rerdell's story that Dorsey had expressed the opinion that where a friend's welfare was concerned perjury might become a duty.

A correspondent directs our attention to the following clause in the Fourteenth Amendment to the Constitution of the United States: "Neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States; . . . but all such debts, obligations, and claims shall be held illegal and void." Our correspondent asks: "Is not this provision something of an obstacle to the law passed by the Tennessee Legislature to pension ex-Confederate soldiers? And is there no citizen of Tennessee who feels sufficient interest in the matter of the necessary tax to bring the validity of the law before the Federal Court? There being a Federal question involved, ought not a Federal court to decide whether the law was passed to fulfil an assumed but void obligation?" Our opinion of the moral character of such a proceeding on the part of a repudiating State we have already expressed; but we do not think the granting of pensions to ex-Confederate soldiers can be called an assumption or payment of a "debt or obligation incurred in aid of insurrection or rebellion." A pension is a gratuity, and such a gratuity paid in 1883 can scarcely be called assuming or paying a debt incurred "in aid" of a rebellion which occurred twenty years ago. However, the significance of the fact, that while granting pensions to ex-Confederate soldiers the State of Tennessee cheats her creditors on the pretence of poverty, remains the same, whether the pension act be constitutional or not.

The temperance movement in the West receives a great part of its impetus, in one way and another, from women, who, down-trodden and oppressed though they be, frequently make short work of the "rum" vender. Last week Davis & Drumm opened, on H Street, in the orderly little town of Lompoc, Cal., what is called by some euphemists a "sample-room"; by others, a "saloon." But the opening was not of the kind they expected. From all points of the compass a great mass-meeting came flocking together, and joined in singing, prayer, speeches, and exhortations. In these proceedings the women were particularly prominent, "mothers pleading most pathetically" with the saloon keepers to "yield like good men and give up the business." The misguided Davis & Drumm, however, only replied with taunts and sneers, and, after vain attempts at a compromise, a rope was run round the saloon, and the crusaders of both sexes pulled the building from its foundations "endways," and, amid wild cheers, "tore it to flinders." Lompoc is said to be a "temperance colony," and this is not the first time in its history in which its hostility to rum has been shown. In eight years a drug store has been emptied of liquor, a hotel has been shelled, and a saloon treated in the same way. The mass-meeting which disposed of Davis & Drumm, before adjourning, resolved that in future any one attempting to sell liquor in Lompoc should be tarred and feathered and ridden out of town on a rail.

It is said that 900,000 citizens have petitioned the President to pardon Sergeant Mason, who was court-martialed for trying to kill Guiteau when placed on duty to guard him from the mob. One of the grounds on which the petitioners rely is "the great and universal indignation then and now felt and expressed by the American people against the assassin of President Garfield." Now, Mason was placed on guard solely because it was feared by his commanding officer that this great and universal indignation would lead to violence. In firing on Guiteau, therefore, he not only attempted murder, but committed the very offence which he was there to prevent others committing. To pardon him on this ground would be to give a positive encouragement to mob-law and murder, and strike a terrible blow at discipline in the Army. That such a petition should find multitudes of signers is singular enough; that it should be addressed to the President, the constitutional head of the military service, makes the case still more grotesque. One incident in the effort to get Mason pardoned illustrates the true nature of many movements of this kind. Twelve thousand dollars were raised for his family, and now comes his lawyer and "files a bill in equity" asking to have Mrs. Mason compelled to pay his bill of $3,500 for "services and disbursements" in trying to procure her husband's release, out of $7,000 which she now has in bank. The bill in equity, if successful, will probably cost just $3,500 more, so that Mrs. Mason would be exactly able to meet the cost of *not* getting her husband out of jail, and thus have the satisfaction of knowing that she had paid her lawyer in full.

The people of Uniontown (Pa.), who are so much excited about the acquittal of Dukes that they have warned him to leave the place within twenty-four hours, would gratify a very legitimate public curiosity if they would explain in some authoritative way how the jury which tried him came to be made up of such very ignorant men. For this state of things the expulsion of Dukes is a very incomplete remedy. If the jury represents the intelligence of the county, it is surprising that it has not produced many Dukeses before now. Dukes himself, in proposing to continue his practice at the bar and sit in the Legislature, gives some indications of mental obtuseness not far removed from that of the jury. The letters he wrote to Nutt about his daughter appeared to us those of a moral monster, but they did not strike the jury in that light. They apparently took the Dukes view of them, that they were not very nice, perhaps, but such as an angry man might fairly be expected to write to the father of a girl whom he had been courting and had jilted. So that it is very possible that Dukes is as much bewildered by the Uniontown feeling against him as the jurymen are by the excitement over their verdict.

There is, of course, no way of improving the Uniontown jury panel all at once. Such as it appears in the Dukes trial, it is evidently the result of a low condition of popular education in some parts of Pennsylvania. This cannot be remedied as far as the present generation is concerned. The moral sense can perhaps best be cleared and sharpened by such outbursts of popular indignation as the verdict has called forth. This brings home to men in a rude, coarse, but effective way that it is a serious thing to let a murderer go on the plea of self-defence, especially when he has been writing the victim indecent letters about his daughter, and that it will not do to mix up the evidence taken at the Coroner's inquest with the evidence taken at the trial, and that jury duty is a very serious matter. No sermons, or charges from the judge, or addresses from counsel, have half as much effect on an ignorant man in rousing his conscience as the wrath of his neighbors. Doubtless it often works the wrong way, but as a general rule the indignation of the community is on the right side. It is its apathy and indifference which are apt to be immoral.

That eminent and well-known reformer, Mr. B. F. Butler, has written a strong letter condemning the Government officials for their failure to carry out the law which makes eight hours a day's work in the Government arsenals and workshops, and says he has a petition before the Court of Claims which will test the rights of all mechanics under the law. The truth about that law is that it was passed in one of the bursts of demagogy which occasionally overtake Congress, under the influence of the labor agitation which raged in the United States as in other countries, with extraordinary fervor, fifteen years ago. The theory was produced at that period, and had a considerable run, that the day's work was twenty per cent. too long; that every laborer could produce as much in eight hours as in ten, and that even if he could not, the two hours' leisure would be so valuable to him, for purposes of self-culture, that he ought to have it, and that it ought to be secured to him by law. Legislation was therefore demanded from all the States making eight hours a legal day's labor. Of course, the silliness of the idea was apparent to everybody capable of the least reflection. None but the lowest grade of laborers could have been imposed on by it. There was no use in fixing the length of the working day at eight hours unless the rate of wages was also fixed, and unless every man was forbidden to work more than eight hours. As long as any man could work ten hours if he pleased, of course the eight-hour men would be fatally worsted in the labor market; and though time for culture might be very valuable, it would not fill their bellies. In fact, when one goes back now to the discussions which this matter called forth in 1868, one seems to be listening to Sunday-school lectures on political economy, and feels what great advances the

country has made since the war in what may be called "horse sense" in financial and economical matters. In that year Butler and a host of others were bellowing away daily in favor of an eight-hour law and unlimited greenbacks, and the repudiation or scaling of the national debt, and had a very respectable following. Now, when he revives one of his old cries, few people examine it from other motives than curiosity.

The wine production of California is reported to be steadily growing. In 1881 the vintage was about 9,000,000 gallons. In 1882 it was estimated to be between 10,000,000 and 11,000,000 gallons. In France it is noticed that the exportation of champagne from that country to the United States is seriously falling off. It was 123,574 dozen bottles during the first six months of 1881, and only 104,755 dozen during the corresponding six months of 1882. This is attributed to the substitution of California wines for French wines, the California wines being, according to an admission contained in a communication from the French Minister of Commerce to the President of the Reims Chamber of Commerce, "not much poorer" than some imported articles, and very much cheaper. California red and white still wines are passing in the same way for wines imported from France or Germany. The California wine-grower, or the merchant who buys from him, gives the California wine a foreign name for the purpose of finding a market for it. That policy may, in a certain degree, be successful, but it is after all a short-sighted policy. Some of the wines raised in California are really very good. If they continue to be sold under foreign labels, they will never make a reputation of their own. They will always be looked upon as cheats and counterfeits, which ought not to appear on a gentleman's table. Only when they assert their worth in their own names, will they be recognized as the equals of foreign products whenever they deserve it, and command a corresponding price.

A shocking social homicide was committed in Hill County, Texas, at a ball last week in a private house. One of the guests, Mr. T. P. Varnell, asked one of the daughters of the family, and his partner in the dance, to take a stroll with him outside the house, when he attempted to assault her. Her screams brought her father to the scene, whom Varnell incontinently shot dead. The affair, which has apparently occurred among persons in a good position in life, has roused an extraordinary amount of public indignation, and led to the formation of a county law-and-order association, the members of which bind themselves to answer all calls for assistance from the officers of the law, and to do whatever needs to be done to enforce its execution, even at the risk of their lives, and to pay the cost of arms, horses, and other necessaries of persons belonging to the posse thus summoned; and in case any such member is injured, either in person or property, to hold them harmless, and prosecute all persons assailing or persecuting them. The creation of such organizations throughout the South would soon solve the homicide problem.

There is something very touching about the zeal of the philanthropists who are trying to secure "freedom of worship" for the young ragamuffins confined for their good in prisons and reformatories. The matter is now engaging the attention of the Legislature in Massachusetts, as well as that at Albany. It is proposed in Boston to change the law so that none of the little Massachusetts convicts shall be compelled to attend religious services other than those which have been the choice of their parents. In most cases, however, the parents of this class of young people are pretty difficult to find, and what is to be done then? The freedom-of-worship bill at Albany provides for this case by allowing the young convict to choose his own religion; so that he can insist on worshipping according to the Parsee or Buddhistic faith if he desires. But how about agnostic infants? Have they no rights? Shall the young agnostic thief be compelled to violate his conscience while the Catholic, or Episcopalian, or Presbyterian pickpocket's scruples are so carefully protected?

The Government of Italy has fixed upon the 12th of April for the resumption of specie payments. Gold to the amount of $83,500,000 has been accumulated for the purpose. This sum would seem to be ample to meet every exigency. It will be found, probably, that the demand for gold, when resumption-day comes, will be very little if any in excess of the requirements of bankers for foreign remittances. These requirements must be small, seeing that the gold premium a month ago was only one-half per cent. If the Government meets the demand boldly and pays out its coin freely, giving to the note holders the option of taking either gold or silver, according to their free choice, there cannot be any great drain upon the Treasury. If, on the other hand, it shows timidity and tries to force silver upon the public against their wishes, it will breed distrust and provoke a run. There is every reason to anticipate that the experiment of resumption will prove successful. It is worthy of remark that the cataclysm presaged by the bimetallists in the Paris Monetary Conference—to which Mr. Goschen, singularly enough, gave some countenance—as the result and consequence of gold resumption by the paper-money countries of Europe, is as far off as ever.

The later despatches show that it is generally acknowledged in England, as the result of the police investigations, that Lady Florence Dixie has either been guilty of a very gross attempt at imposture, or has been the victim of a kind of hysterical delusion of which there have been numerous examples. The absurdity of the tale as she told it was so patent that most people will incline to the latter explanation of her escapade. It appears that not only the gardener but a soldier and a woman were close by the spot on which she made the assault take place, at the hour she named, and heard nothing and saw nobody, and the damp mould of the shrubbery showed no trace of the deadly struggle. The affair will probably do good in diminishing or putting a stop to Lady Florence's political activity. She has done some excellent work of a charitable kind in Ireland, but her explorations in politics, and especially those about the Land League fund, have been simply exasperating and confusing. She furnished, in fact, an excellent illustration of the inconveniences of female participation in exciting political controversies. She brought against the Land Leaguers, on evidence, if any existed, of the flimsiest kind, the double charge of embezzling the funds and using them to promote assassination. Of course the answer to such charges could not but seem brutal and truculent; and then there resulted naturally more or less English horror over the Land Leaguers' treatment of a "woman," to which she appears now to have appealed by exhibiting "stabs" in her corsets.

The English Lord Chancellor has introduced a bill into Parliament to modify the powers of judges to punish for contempt of court. At present the power is unlimited, and is, in fact, a vestige of the ancient arbitrary authority handed down from times when the sovereign administered justice in person. The bill fixes limits both as to length of imprisonment and fines. The right to punish without limit in the case of marriages of wards in Chancery is, we believe, retained, so that this may still furnish materials for the novelist and the composer of comic opera. The American heir is not mentioned in the bill; but whether the difficulties with which he always meets in getting the money awaiting a claimant in the vaults of the Bank of England, are connected in any way with the power to punish for contempt, we do not know. A deep obscurity envelops this branch of equity, and probably nothing short of a Parliamentary inquiry will ever clear it up.

The debate and division on Parnell's bill for amending the Irish Land Act are generally admitted by the Liberal press to be very serious in some of their aspects. The bill was intended to remedy what all admit are very grave defects in the Act, some of which have been revealed by judicial decisions. The principal are—the inability of the tenant to get the benefit of the Act from the time he gives notice of his intention to apply for it; its failure to cover the leaseholders, who constitute one-fourth of the tenant farmers; and its failure to protect the tenant against having to pay rent on his own improvements. Parnell had the direct support of all the Ulster members, who have hitherto stood by the Government, and of many English Liberals, such as Mr. James Bryce, who spoke in the debate, and the indirect support of others, who refrained from voting altogether. Parnell's speech was in places violent and injudicious, but Gladstone's flat refusal to hold out any hope of an amendment to the bill is felt to be a grave matter, as likely to alienate the Scotch-Irish of the North, and thus increase the Home-Rule forces at the next election. Mr. Shaw, one of the most moderate and respected of the Irish members, who has always held aloof from the Parnellites, has already made a speech in the North advising the farmers to throw off all allegiance to either English party, and vote for whichever promises them most.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 21, to TUESDAY, March 27, 1883, inclusive.]

DOMESTIC.

TIMOTHY O. HOWE, Postmaster-General of the United States, died at Kenosha, Wis., on Sunday. He was born in 1816 at Livermore, Me. He was a member of the Maine Legislature for a year, and in 1845 removed to Wisconsin, where he became Chief Justice of the State, and afterward for eighteen years United States Senator. He was a member of the Monetary Conference which met at Paris in 1881. In December of the same year he was appointed Postmaster-General by President Arthur. The President directs that the Post-office Department and its dependencies in the Capital shall be draped in mourning for a period of thirty days, that the several executive departments shall be closed on Wednesday next, the day of the funeral of the deceased, and that on all public buildings of the Government throughout the United States the national flag shall be draped in mourning and displayed at half-mast.

The Post-office Department has received and filed for examination a large number of claims of postmasters who are entitled to increased salary under the provisions of the Readjustment Act, known as the "Spaulding Bill," passed at the last session of Congress. An attorney representing a number of these postmasters is now in Washington, and has made an informal argument in their behalf at the Post-office Department, maintaining that the increase of salaries provided for by the act may properly be paid out of the regular appropriation for salaries for the current fiscal year. The officers of the Post-office Department, however, assert that the law providing for the readjustment of postmasters' salaries cannot be carried into effect without a specific appropriation, and that to pay the amount of the increase of salaries out of the regular Appropriation Bill would create a large deficiency. It is the intention of the Department to begin the work of readjusting salaries under the two-cent postage law, as provided for in the Bingham Bill, as soon as possible.

The Second Assistant Postmaster-General has ordered the establishment of a post route in the Territory of Alaska, to extend from Haines to Juneau, a distance of 105 miles. The service will be monthly. The mails will probably be carried by canoe. The contract was awarded to Sheldon Jackson, of the New York Presbyterian Missionary Society. This is the first mail route established in Alaska.

Governor Ordway, of Dakota, has written a letter to the Secretary of the Interior giving some particulars with regard to affairs in that Territory. He says the Territorial Assembly adjourned on March 9, and that 300 of the bills passed by it have become laws; legislative provision was made for nine penal, charitable, and educational institutions to be situated in various parts of the Territory; and an issue of Territorial bonds to the amount of about $400,000, bearing 5 and 6 per cent. interest, was authorized to provide funds for the erection of the necessary buildings. A bill was passed and approved naming nine of the most reputable men of the Territory as commissioners to select a place for the Territorial Capital and to erect, at a cost not exceeding $100,000, the necessary Government buildings.

A statement has been prepared at the Treasury Department which shows the total estimated receipts of the Government for the fiscal year ending June 30, 1883, under the operations of the new Tariff Act, to be $405,000,000. Of this amount $220,000,000 is the estimated revenue from customs; $143,500,000 from internal revenue, and $41,500,000 from miscellaneous sources. The revenues for the fiscal year ended June 30, 1882, were as follows: From customs, $220,410,000; from internal revenue, $146,497,000; from miscellaneous sources, $36,618,000; total, $403,525,000.

Attention has recently been drawn to the fact that the new Civil-Service Law is silent as to any distinction to be made between male and female applicants for places in the executive departments. The problem of reconciling this state of affairs with the present practice in most of the departments, of giving male applicants for office the preference in appointments, is now the subject of consideration by the Civil-Service Commissioners. The rules to be drawn up by the Commission will, it is understood, contain some provision bearing upon this question, the Commissioners being cognizant of the necessities of the public service and the opposition on the part of heads of departments to any large increase in the number of female clerks.

Stephen W. Dorsey was put on the witness stand by the defence in the Star-route trials on Monday. Before taking the oath he was asked some questions by the prosecution in regard to his belief in a "future state of rewards and punishments," which brought Mr. Ingersoll to his feet with an indignant address in regard to the "perpetuation of this monstrosity of the dark ages." The Court ruled that, under the Act of March 16, 1878, the defendant was allowed to testify. Dorsey's evidence, like Brady's, was a succession of sweeping denials. He had never entered into a conspiracy with Brady, John Dorsey, Vaile, Miner, or any or either of them to defraud the Government by bidding for mail contracts. He never had any transaction with Brady to the extent of one cent in his life. He had never given any direction to Rerdell to open an account with William Smith, or with Samuel Jones, or with John H. Mitchell, nor had he ever stated to Rerdell, or any one else, that William Smith stood for Brady. On Tuesday he flatly denied all of Rerdell's most damaging statements.

The Grand Jury at Washington on Tuesday brought in two indictments against ex-Senator Kellogg, of Louisiana, and two new indictments against Brady. The first presentment against Kellogg charges him with (while Senator) receiving $20,000 from Price, a mail contractor, with which to bribe Brady to allow to Price an increase of pay and compensation for carrying the mails over certain routes. The second presentment charges Kellogg and Brady jointly with having conspired with Price to defraud the Government by means of false oaths and fraudulent claims for increased pay. The two presentments against Brady charge him with having received $25,000 for awarding the contracts on the routes described in the presentment against Kellogg.

Four survivors of the *Jeannette* arrived in New York on Tuesday morning by the steamer *Westphalia*. Two of the men were seamen, one a fireman and the other a coal-passer. Their names are: James H. Bartlett, Herbert W. Leach, Francis Manson, and John Lauterbach. They were in good health, and were highly praised for their behavior during the expedition by Chief Engineer Melville and Lieutenant Danenhower. The *Jeannette* Court of Inquiry will now be reconvened about April 1.

The remains of John Howard Payne, the author of "Home, Sweet Home," arrived at New York on Thursday, and were taken to the City Hall, where they lay in state and were visited by thousands of people. On Friday they were taken to Washington by a special train, and will be interred at Oak Hill Cemetery on the 9th of June, the ninety-first anniversary of his birth, and services in honor of his memory will be held at the grave.

The Tennessee Senate on Friday adopted a resolution authorizing a settlement with the defaulting Treasurer, Polk. He is to be allowed to pay $175,000 in Tennessee bonds and $75,000 in notes issued by the Bank of Tennessee, which shall be credited upon his deficit for the sum of $250,000, and which, when paid, shall relieve his sureties. But nothing in the act is to prevent the prosecution of Polk.

A Senate committee nearly two years a[go] began an investigation into the accounts of e[x-] State Treasurer Churchill, of Arkansas, the[n] Governor, who had served as Treasurer for six years on three terms. The committee spent a year on the accounts and reported a deficit of $114,000. When the Legislature met in January last the House refused to accept the report, saying the law required an investigation by a joint committee. Finally a joint committee was appointed and the work was begun anew. On Saturday a final report was made which charges a deficit, according to the face of the books, of $233,600 87. The difference in the two reports causes much comment. The matter is to be brought before the courts.

The coming election of the Mayor in Chicago will be made to turn on the license question. At a conference on Monday between the Citizens' Committee and the Republican managers, the former adopted a platform for the Mayoralty campaign declaring for a license of $250 a year for beer saloons, and $500 for shops selling distilled liquors. The Republicans took no action, but tacitly acquiesced in this declaration of principles. The Republicans and Citizens are running a joint city ticket.

The "straight-out" Democrats of Rhode Island have bolted the Sprague ticket, and published an address calling upon all true Democrats to support a ticket headed by Charles R. Cutter and Horace A. Kemball for Governor and Lieutenant-Governor. Another blow to Sprague's chances has been given by the refusal of George, the nominee on the Sprague ticket for Lieutenant-Governor, to run.

A despatch from Uniontown, Penn., says that N. L. Dukes, the murderer of Nutt, arrived there on Sunday night, and on Monday morning a committee of citizens presented him with resolutions adopted at the recent indignation meeting, and gave him notice that he would have twenty-four hours within which to transact his business and leave the town.

A general call of the National League of Ireland and the Irish National Land League of the United States and Canada has been issued for an Irish-American National Convention, to be held in Philadelphia on April 26. It is announced that Mr. Parnell will surely be present.

Another move has been made by the opponents of President Porter, of Union College, to oust him from his position. It is in the shape of a bill providing that six of the State officers who are members of the Board of Trustees of Union College shall cease to be Trustees, and that the vacancies then created shall be filled at the next annual meeting of the Alumni, which takes place at Commencement in June next. As the majority of the Alumni are thought to be opposed to President Porter, it is expected that the new Trustees will be "anti-Porter men." The bill has passed both houses of the Legislature, and is now before the Governor.

The St. Louis *Post-Dispatch* has reports of the winter wheat crop from over 200 counties in those parts of Illinois, Indiana, Kentucky, Tennessee, Kansas, Missouri, and Texas where winter wheat is grown. The reports from Missouri and Kansas show that the condition is good, the acreage is fully equal to last year, and the damage so far is no greater than is usual at this time of year. Tennessee and Illinois give fair reports, but Kentucky and Indiana, especially the latter, show considerable damage. From Texas reports are meagre, but those received are good. It is learned from other sources that the condition is generally good, with a fair prospect for a full crop. The reports also show that a large amount of last year's corn crop still remains in the above-named States.

FOREIGN.

A despatch from London on Thursday said that the police were in possession of a clew to

the explosion in the office of the Local Government Board. A woman observed, and has fully described, the appearance of a man who was apparently placing an infernal machine against the building. It is expected that an arrest will be made soon.

Two thousand infantry have been ordered to protect the public buildings in London, and the Coldstream Guards have been posted in the Parliament Buildings and Buckingham Palace.

Lady Florence Dixie's story is now very generally disbelieved. Captain O'Shea, Home-Rule Member of Parliament for County Clare, has informed Sir William Harcourt, Home Secretary, that when the House of Commons assembles after the Easter holidays he will ask whether Lady Florence Dixie formerly hoaxed the public by the invention of a letter from King Cetewayo, and whether, as a result of the inquiry into the alleged assault upon her at Windsor, the police have concluded that Lady Florence is an impostor.

A Dublin despatch says that counsel for the defence in the murder conspiracy trials are confident that they will be able to shake the testimony of James Carey. Cardinal Manning has issued an appeal asking for a collection in aid of the distressed people in Ireland. In the trial of Nugent and twelve other members of the Armagh Assassination Society, on the charge of conspiracy to murder, at Belfast on Friday, the jury rendered a verdict of guilty. On Tuesday six more members of the society were found guilty.

The London *Times* of Saturday pointed out that the Belfast jury which rendered a verdict of guilty upon Nugent and his associates accepted as authentic a diary kept by the plotters, in which it was reported that a man had sworn, at the request of the Land League, to kill a landlord named Brooke.

The Dublin *Freeman's Journal* states that the correspondence which has passed between the Home Office and Mr. Lowell, the United States Minister, has resulted in the former's renouncing all hope of securing the extradition of the person known as "Number One." The *Journal* declares that "Number One," whose name is Tyner, was in Dublin until the first day James Carey was examined at the hearing of the conspirators. He then managed to reach Bremen, by way of Hull. From Bremen he proceeded to Havre, and thence to New York. He was a member of one of the London volunteer corps.

Mr. Parnell, who is now in Paris, has made a number of statements there which have attracted attention. He is reported to have said, among other things, that the Government came to him while in Kilmainham Jail and asked him to intervene and suppress outrages. It is asserted that he will be asked in Parliament either to confirm or deny some of these statements.

A rumor was circulated during the week to the effect that the British Government, through Mr. West, had intimated "that the violent expressions which certain professed American citizens have given utterance to since the recent explosion in London may disturb the otherwise amicable relations existing between Her Majesty's Government and the United States," but it is asserted to be entirely without foundation. The London *Daily Telegraph* of Monday treated as preposterous the report that the British Government had sent a menacing note to Washington in regard to the utterances and writings of the Irish dynamite party in America. It said that the United States Government's attitude of indifference at the ravings of these men is the same as that which England has always adopted toward exiles taking refuge in this country.

While the service in St. Paul's Cathedral, London, was in progress on Saturday a well-dressed man ran up the altar steps with his hat on, leaped upon the altar and dashed the cross, candlesticks, vases, and flowers to the ground. The Dean and several of the choristers secured the man after a struggle and gave him into the custody of the police. In the excitement many persons left the church, horrified at the sight.

The great review and sham fight of the Volunteer troops took place on Monday at Brighton, England. The weather was fine and cold, and favorable for the movements of the men, about 20,000 of whom were engaged.

John Bright delivered an address on Thursday as Rector of Glasgow University. He said that American independence, the French Revolution, and the English Reform Bill had transferred power from monarchs and statesmen to the people, and dwelt upon the advisability of a peaceable policy even with a view to self-interest. The cost of the civil war in America, he declared, would more than have sufficed to free every slave without bloodshed. With regard to Ireland, he said that if the Treaty of Limerick had been fulfilled and freedom of religion granted, the sad history of that country might never have been recorded. India was the great problem of the future.

A meeting of the English Revolutionary League has been held in London to consider the question of holding a great international convention of revolutionists. The President of the meeting said that the Government officials now recognize the fact that dynamite is an important factor in political life. It was resolved to invite Louise Michel and other prominent Socialists to the proposed convention.

An explosion occurred on Saturday night near the Ministry of Justice at Rome. Upon investigation, remnants of a bottle which had been filled with gunpowder were discovered. A man, who is supposed to have placed the bottle there, has been arrested. He had in his possession a portrait of Overdank, the bomb manufacturer, who was executed in Austria.

A socialistic manifesto is in circulation in the southern part of Russia inviting the people during the coming fêtes on the occasion of the coronation of the Czar to pillage the houses of the nobles and Jews. A deputation of nobles has gone to St. Petersburg to ask Count Tolstoi, the Minister of the Interior, to provide for the protection of their property.

The London *Standard's* Varna correspondent says that business at Erzerum is at a standstill, in consequence of the movement of the Russians in the Caucasus. The growing opinion is that a Russo-Turkish conflict is imminent. The Armenians are wearied with the indifference shown by Great Britain to their wrongs, and would welcome Russian occupation. The Russians along the frontier number 100,000.

A despatch to the *Daily Telegraph* from Vienna says that several villages at the foot of Mount Ararat have been destroyed by snow avalanches. It is stated that 150 persons have been killed and 100 injured.

The inhabitants of Carlovo, Sopot, and Kalofer, in Rumelia, have risen against the importation of foreign woollen thread, and several depots containing such thread have been pillaged and burned. The militia refused to suppress the outbreak.

Mount Etna has been in a state of active eruption. A new crater has opened, and the lava threatened to overwhelm Nicolosi and other villages. The people in the threatened places left their homes. There are eleven fissures in the mountain. On Monday the eruption had subsided, and all danger was over.

A despatch from Geneva says that the emigration from Switzerland to America is assuming alarming proportions. Several districts are fast becoming depopulated. The exodus is owing to bad harvests and American competition. The Swiss Consul in New York, however, declares the report untrue.

The *North German Gazette* says that one of the main obstacles to peace between Prussia and the Roman Curia is the continued presence at the Vatican of Cardinal Ledochowski, Archbishop of Posen. The Prussian Government has informed the Vatican that Cardinal Ledochowski can quit the Vatican without fear of arrest, as the extradition treaty does not apply in his case. It is stated that Prussia, in answer to a note of Cardinal Jacobini, Papal Secretary of State, has refused to concede the demands of the latter relative to education and the appointment of priests, and that all the negotiations up to the present time have been a failure.

Despatches from Berlin say that the Spanish Minister there is about to go on a furlough, and will probably remain absent until the settlement of the differences between Spain and Germany with regard to customs duties. The treaty of commerce between Germany and Mexico has been submitted to the Bundesrath. It secures the safety of the retail trade and the freedom of property owned by Germans in Mexico from forced loans or war charges.

The American artists in Paris have formed a committee to draw up a petition to Congress, asking for a repeal of the clause in the new Tariff Act increasing the tax on works of art.

A French transport, with 500 troops for the Tonquin expedition, arrived at Haidong on February 21, increasing the number of the force to 2,500 infantry. No active hostilities are expected, however, a pacific settlement having been arranged.

Tewfik Bey, formerly Minister of Finance, has been appointed Turkish Minister at Washington.

Dr. Francisco Garcia Calderon, who is a prisoner in Chili, has addressed a note to Dr. Logan in which he objects to the despatch addressed by the latter to Admiral Montero, and objects to its having been given publicity. In this note Dr. Calderon informs the public, for the first time, that he was once on the verge of making peace, but failed to do so owing to the Chilians augmenting their demands. The condition of affairs in Peru continues unaltered, but as the Chilians have released several of their more important prisoners who have returned to Peru to advocate peace, the prospects continue to improve.

There is a revolution in Ecuador. Dictator Veintimilla is in Guayaquil, but it is probable that the revolutionary troops will soon enter the city without a struggle. Business is bad and the coffee trade has been almost destroyed by the war. Rioting has been prevented by the presence of an Italian and a British man-of-war.

London advices from Buenos Ayres under date of February 24 report that a fight occurred in Patagonia between Argentine and Chilian troops, owing to the refusal of the former to quit Chilian territory. Several men were killed and a number wounded. The Argentine troops finally retired across the border. Another despatch from South America reports the Chilian troops to be marching upon the city of La Paz, in Bolivia.

The Chinese authorities protest vehemently against the injustice of the British with respect to telegraph stations. The Hong Kong Government recently prohibited the landing of a telegraph line in that colony. The Chinese now oppose the landing of a British line at Shanghai. The British Consul has received instructions from home to effect and maintain a landing by force if necessary.

The *Commercial Advertiser* of Honolulu, referring to reports of the general spread of leprosy in the Sandwich Islands, says that certain districts of the island of Kauai, comprising an area of 300 square miles of the most densely populated portion of the kingdom, with 10,000 inhabitants, have been thoroughly searched for lepers by the Board of Health. The result was that twenty-eight native and no foreign lepers were found.

ENGLAND AND THE IRISH-AMERICANS.

EVER since the Irish troubles entered on their present phase, in 1880, it has been recognized clearly in England that they owed a great deal of their gravity to the help and encouragement which the malcontents received from their countrymen on this side of the water. Without this help and encouragement the Land League could hardly have been organized and carried on as it was. A very large, if not the larger, part of its funds came from America, and with the money there came what was perhaps of more importance than money, the assurance that the Irishmen in Ireland had at their back nearly as many more in the United States. This was an absolutely new feature in the Irish situation. In their past struggles with England, the Irish have had no outside aid to rely on but that of France, and that was only twice given, and was given grudgingly and on a small scale, and never accomplished anything. All through the eighteenth century there was a large body of Irishmen in the French service, and sympathy for Ireland was one of the traditions of French foreign policy, which was maintained after the Revolution and found expression in Humbert's small expedition in 1798. In the Rebellion of 1798 France was the principal reliance of the insurgents, and this feeling was still so strong, fifty years later, that it was undoubtedly the Revolution of 1848 in Paris which precipitated the melancholy outbreak of the Young Irelanders in that year.

Now all is changed. What is, for the purposes of the Irish malcontents, to all intents and purposes another Ireland has sprung up on this side of the Atlantic, which is worth a hundredfold more to them than France ever was, particularly as America is now far nearer Ireland than France was even fifty years ago. Moreover, the Irish in America are better off pecuniarily than Irishmen of the same way of thinking ever were before. They number nearly 2,000,000, too, and count, as enemies of England, for fully double that number of the population of Ireland before the famine of 1847. The consolation the London *Times* has, therefore, more than once found in the reflection that Irish discontent is no longer the formidable thing it used to be—because, while Irishmen were a third of the population of the British Isles at the beginning of the century, they are now only a sixth or seventh—is but poor consolation, after all. It must be admitted by every candid observer that, considered as a menace to English peace, the Irish population is now more formidable than it has ever been, and much better furnished with weapons of aggression. The great emigration which the *Times* in 1848 rejoiced over with such unfortunate glee, far from proving a relief to British politics, has prepared the present crisis, and is now giving it terrible aggravation. The population of Ireland is, for political purposes, nearer 10,000,000 than 5,000,000, and can give a dollar for English torment where forty years ago it could only give a cent.

It is not surprising, under these circumstances, that the British Government should be very anxious to have the United States do something to restrain the Irish agitators, and, above all, the truculent and bloodthirsty Irish press, on this side of the water in their efforts to promote turbulence and crime in Ireland. It would not be surprising, even if the Irish newspapers here were not as ferocious as they are, and even if they did not furnish weekly encouragement to the perpetrators of outrages in Ireland, and help to persuade them that the blowing up of public buildings and the assassination of public officers are acts of "war."

For the last two years the English press has abounded with remonstrance to the American Government on this subject. It is every now and then asked to muzzle the *Irish World*, and to prevent people like O'Donovan Rossa from collecting money avowedly for the commission of crime in Great Britain and Ireland. There are rumors to-day that an official note embodying these complaints has found its way to Washington, and will have shortly to be answered. We cannot help doubting that there is any truth in this, but if any such note has come, the answer is unhappily very easy. We have, in the first place, no law for the punishment of such offences, and the reasons why we could not get one passed in deference to English susceptibilities are substantially the same as the reasons which prevented the passage of a similar bill in 1858, on the demand of the French Government, by the British Parliament. Lord Palmerston's Ministry fell under the attempt to carry that bill at that time, not because Englishmen approved of attempts to assassinate foreign rulers, but because they were unwilling to legislate in aid of foreign governments trying to stifle internal discontent, or to restrict in so doing the right of asylum to political refugees. Anybody who proposed such legislation here would fare no better.

Moreover, in case such a law were passed, it could not be executed through juries. The attempt to restrain freedom of speech on political topics by law was once tried in this country, at a period when people had far more respect for official authority than they have now, and it failed ignominiously. It would fail more ignominiously to-day. No American jury could be got to sit long on the question whether Irish exiles were justified in using threats and foul language in their newspapers against English officials. They would say, naturally enough, that as England appears to be unable to restrain Irish license in speech and behavior on Irish soil, with a large army and fleet, it was asking too much to expect Americans to help her in the work here. Unquestionably any such trial would end in the triumph of the "assassination press," and in enlisting on the Irish side the sympathies of tens of thousands of Americans who now pay no attention to the Irish question whatever, or are thoroughly disgusted with the Irish mode of agitating. No worse service could be rendered to the British Government to-day than an effort to force an expression of opinion on the merits of the Irish controversy from any body of Americans, even a body so small as a jury. There is, in fact, only one way for England out of the difficulty, and that is to come to terms with reasonable Irishmen. Having done this, she will not suffer long from the unreasonable Irishmen. At present, she is trying to govern Irishmen, reasonable and unreasonable, in a way that will suit the prejudices of Englishmen. In that undertaking she cannot expect much aid from busy and uninterested foreigners. That it is chimerical, nearly everybody out of England sees. It is high time it came to an end.

SPORTS IN AND OUT OF COLLEGE.

PRESIDENT MCCOSH has written a letter on the subject of college sports, in which he takes up the common complaint, that college students are allowed to devote themselves to the pursuit of athletics at the expense of those branches of learning which they are, in theory, sent to college to acquire. There is a pretty widespread impression that, as he puts it, the *enthusiasm* of college life tends in the direction, not of literature or science, "but of muscles and bones"; and he tells an anecdote of a father who, on the occasion of his son's graduation, bitterly remarked to a professor that he had sent his boy to college to become a scholar, but that what he had learnt there only fitted him for a position in a circus.

> "Certainly the ambitious boy with a big body and a little mind feels it to be a mighty reward when he gets, because he has performed a feat, a cheer from 10,000 people assembled on the field in which Yale and Harvard are fighting for the headship. As the most fatal issue of this spirit, perhaps the idlest fellow in his studies becomes the hero of his class, is fêted, and gets the honors which his class has to bestow. It follows, incidentally, that the fine scholar is not appreciated, and is spoken of as a plodder, and branded with similar opprobrious epithets. Another incidental consequence has followed, I am sorry to say. Some students, and graduates, too, not satisfied with seeing the pure display of agility, wish something more stimulating, and bet on one side or the other; and among a few there is a considerable amount of gambling, stirring up the lowest passions of our nature, such as avarice and selfishness, and leading on to mercantile gambling, ending, it may be, if not in bankruptcy of fortune, in bankruptcy of character."

Admitting the evil, President McCosh says very justly that the true way to meet it is that already taken at Harvard—for the colleges themselves to undertake the supervision and regulation of college sports. To try to break up rowing and base-ball and foot-ball would be absurd, but students may be prevented from playing with professionals who earn their living by means of athletics, limits may be imposed as to the time allowed for sports, in short, the colleges may recognize that not only physical training but physical contests are an indispensable part of college life—just as much so as are the intellectual contests which result in "rank" or "honors."

It is really practically out of the question for any university to encourage athletic sports and at the same time to set its face against races, matches, and other contests in which proficiency in them is measured. Anybody who will try to picture to himself what sort of a place a college would be if the undergraduates pulled in wherries, exercised on parallel bars, ran, walked, and played ball solely for the purpose of physical "culture," and without any idea of rivalry or emulation, or of being found worthy of a place in a racing crew, or of holding a position in a college "nine," will at once see that races and matches and games and con-

tests of all sorts are what give to college athletics nine-tenths of their impetus. Hence it is useless to say that athletic exercise is a good thing, but that athletic contests ought to be altogether tabooed, and of course the objectors to them would hardly insist on the colleges going so far as this. What they object to principally is the waste of time taken up in training for "intercollegiate regattas," and the great college ball matches. It should not be forgotten, however, with regard to this, that the number of undergraduates who are drawn away from their studies by the necessities of training is extremely small, and that they belong, in nine cases out of ten, to a class little likely to devote itself to mental work under any circumstances. A young man whose body is his chief capital, may as well employ it, and he can hardly employ it more innocently than by athletic discipline. The colleges are every year more and more abandoning the old theory that an undergraduate must be kept at his tasks and have them set for him like a schoolboy; and under the new system, those who have no intellectual ambition will waste a good deal of their time in any case. College sports save them from so much idleness, if they do nothing more.

It must be remembered that the *enthusiasm* for sport is not confined to college students, but is a feature of modern life outside as well as inside the colleges, and as a matter of fact it runs a much wilder riot outside of them than it does inside. It is not college students who are responsible for the profound interest taken by the public at large, and stimulated by the press, not merely in races or base-ball matches, but in six-day walking matches, starving contests, quail-eating against time, and "events" which are of positive injury to the human body, and are, in fact, merely got up to furnish an opportunity for betting. Any college boy who reads the newspapers must infer from the space devoted to such contests that it is at least an open question whether the honor and glory to be obtained by success in this field is not as great as that to be got by distinguished services in the church, or at the bar, or in public life. A college athlete might fairly maintain that as long as the adult world delights to magnify the fame of prize-fighters, and billiard-players, and quail-eaters, and eagerly crowds to get the news of their performances —just as if they were important discoveries or achievements in science, literature, and art— he may be excused for doubting whether, after all, an enthusiasm for study and mental improvement pays. We have before us a telegraphic despatch giving an account of an event which took place in Philadelphia last week, intended to appeal to adult interest in sport. It was an international "jigging" match between a distinguished Philadelphian jig-dancer named Morton, and a no less eminent performer from Dublin. It drew a great crowd, the theatre was densely packed, and the "excitement ran high." Any college student may fairly insist that boating and base-ball playing are much loftier objects of devotion than this.

The craze for sports, contests, and "events" is a feature of the modern world, and to expect the enthusiasm not to show itself in the colleges would be absurd. In fact, it has forced its way there rather against the feeling of the faculties than by their aid; and considering to what amazing excesses the love of "sports" of all kinds tends in the adult world, it is rather surprising that the college sports are, on the whole, still confined to honest boyish contests of bone and muscle. The promise of leading colleges to supervise and regulate these may serve to reassure us as to the future. College supervision may check the spread of the feeling among undergraduates, which adults do so much to encourage, that a man who can walk five hundred miles in six days, or live without taking food for a month, or "jig" twenty steps in seventeen minutes, is a great public character, who reflects credit on his country and age, and whose memory will be cherished as a precious possession by generations to come.

THE LATE MR. JOHN RICHARD GREEN.

LONDON, March 16, 1883.

FEW books published in England during late years have been so widely read or so heartily appreciated in America as Mr. J. R. Green's 'Short History of the English People.' It made its way at once over the Continent and into the homes of persons of all classes. It gave people ideas about English history they had never received before. It still keeps, and seems long likely to keep, its place as the historical work of this generation which is at once most instructive and most popular. Some account, therefore, of the author of this famous book, who has just expired at Mentone, in the South of France, may be acceptable to those American readers who gratefully remember the pleasure he has given them.

Mr. Green was born at Oxford in 1837, educated at a school there, and afterward at Jesus College in Oxford University. He took his degree there in 1861. But the college was in those days (for it is said to have greatly improved since) one of the least useful in the University. Its teaching was poor, and as its undergraduates were nearly all Welshmen, they mixed but little with the members of other colleges. Mr. Green, accordingly, though his abilities were recognized by a few friends, had no opportunity of making himself generally known in the University, and left it without leaving the mark that might have been expected from him. He was ordained a clergyman of the Church of England, and immediately took a curacy in London, from which he was soon promoted to the pastoral charge of the parish of St. Philip's, Stepney, a district in one of the poorest and most neglected parts of East London. Here he labored for several years with immense zeal and energy, devoting his efforts—as largely happens in England, especially among ministers of the Established Church—to promoting the social and material, as well as the spiritual, benefit of the parishioners. He left Oxford a strong High Churchman, although the first strength of the High Church movement had pretty well spent itself before his time. But his keen and naturally somewhat sceptical mind soon began to question the ecclesiastical position in which his early training had placed him, and he ceased not only to be a High Churchman, but to feel himself comfortable as a clergyman at all. His health, naturally far from strong, had also suffered from hard work under unfavorable conditions and by the strain of the pulpit, for he preached with singular fire and force, throwing himself into his subject with a brilliance that would have made his church crowded had it lain anywhere near the better parts of London.

These two causes led him to retire from pastoral work; and the appointment of librarian to the Archiepiscopal Library at Lambeth, which he received in 1867, gave him easier duties, and enabled him to devote the rest of his time to literature and history. Already, from his college days, he had been warmly interested in historical and archæological studies; had written some detached papers on those subjects, had gathered a good library, had begun to accumulate materials for a history of the Angevin Kings of England. The small circle of friends that knew him privately knew how great his powers were; but the general public, though it had read with admiration the reviews of historical books which he occasionally contributed to the *Saturday Review*, had never heard of his name until the publication of his 'Short History of the English People.' That book, so bright, vivacious, and rapid in its movement, was the fruit of many years of patient thought and study, had been twice almost wholly rewritten, and would perhaps not have appeared even when it did, so high was the standard of merit which its author set before himself, had not his declining health and the urgency of his friends compelled him to publish it as it stood, rather than spend more time in re-revising it. He was, however, so far from thinking it complete that very soon after its publication he set himself to prepare a larger book in the same spirit, filling up whatever had been inadequately treated in the 'Short History,' and correcting some mistakes of detail into which he had fallen. This more elaborate work was completed in four volumes some three years ago. Although it represents his maturer thought and is more exact in details than the 'Short History,' it has not superseded the latter in popular favor, partly on account of its greater bulk, partly because the brilliant boldness and swift march of the earlier book have more attractions for most readers than that somewhat more guarded and quiet strain which a historian who is again traversing old ground is led to adopt.

In 1877 Mr. Green entered on the happiest part of his life, having been married in that year to a lady of remarkable gifts, who entered warmly into all his tastes and pursuits, and not only by her care kept at bay the attacks of pulmonary disease, but doubled his effectiveness for literary work by the help she gave him. Although his life could not have been a long one, it might have lasted for eight or ten years more had he not unfortunately contracted an illness in Egypt in the spring of 1881. He returned to London so weak that for some time his recovery was despaired of; but good nursing and his own indomitable spirit brought him round, and in the five months that followed he finished and brought through the press a book, the 'Making of England,' which describes the conquest and settlement of England by the Angles and Saxons, and the consolidation of their tribes and kingdoms down to the time of Egbert. I need say the less about it because a review of it which appeared in the *Nation* about a year ago did justice to the extraordinary pains and skill with which a picture of Britain as the Romans left it was drawn, and a narrative of the English conquest and an exposition of the social as well as political phenomena of primitive England constructed out of scanty and scattered materials—materials which would have remained barren and useless in any less ingenious hands.

Mr. Green was now compelled to spend every winter at Mentone, far from books, and even when able to work at all could never work for more than three or four hours a day. But the less strength he had, and the more quickly he felt the shadows to be closing around him, so

much the more eager was he to turn what time and strength remained to the best account. When he returned to London last summer, he addressed himself to continue the story of early English history down to Norman or Angevin times, and had almost completed, before winter drove him back to the Mediterranean coast, another volume of five hundred pages, which he proposed to call the 'Conquest of England.' This book is all, or nearly all, in print, and will doubtless soon appear. Though it will want his last corrections, it cannot fail to be of the utmost value to students as well as enjoyable by the ordinary reader, for learning never seemed to weigh him down, or dulled the grace and liveliness of his fascinating style. He had scarcely reached Mentone, in the end of last October, when he became weak and feverish, and from that time on, with occasional rallies, he became constantly weaker in body, though his mind, till the last few days, never lost its freshness and power. During two years, those who saw him used to wonder that with a frame so wasted he could live at all. It was the strength of his will, the quenchless ardor of his spirit, that gave him this strange vitality, prolonging life in the midst of death. He was forty-five years of age, and left no children.

Words spoken over a grave are distrusted, as apt to proceed rather from sorrowing friendship than from a dispassionate judgment. But the highest historical authorities, both here and in America, have years ago allotted to Mr. Green one of the first places among the historians not only of this generation, but of this century. He has certainly left behind him no one who combines so many great and admirable gifts for historical composition. We have men equally learned, equally industrious. We have a few whose accuracy is more perfect than his was, whose judgment is more uniformly safe and cautious. But we have not, and may not for many years to come have, any one who united to so much learning and so wide a range of interest, such wonderful ingenuity, acuteness, originality of view, and such a power of presenting his results in rich, clear, and picturesque language. A great master of style may be a worthless historian. We have some conspicuous instances of the phenomenon. An admirable investigator and sound reasoner may be unreadable. Examples are not wanting of this also. The conjunction of the highest gifts for investigation with the highest gifts for presenting results in a perfect form is a very rare conjunction, which it is impossible to value too highly; for by inducing people to read history who would be repelled from any laborious study it enables them not only to gain just facts and conclusions, but to learn something of the method by which those facts and conclusions are established. The fame which Mr. Green won by his 'Short History' provoked some sharp criticism from other students. Small inaccuracies were discovered and paraded. Critics who did not know how hard he had worked declared that although he was a brilliant writer, he was not a safe guide, and that his praise was that of a popularizer. There could not have been a greater mistake. The merits of the book—its wealth of thought, its richness of color, its sympathy with the times and men it describes—were due not to mere literary dexterity, which, indeed, could never produce such results, but to the patient and intimate study he had given to the annals and the literature of England. He described the landscape so well because he knew it so well, and had marked many small points that had escaped previous observers. Still, it is true that in the 'Short History' he was, by the very magnitude of the subject, obliged to approve his historical capacity rather by bold generalizations than by a careful study of details; and the generalizations, though always interesting, were often open to debate. It was in his 'Making of England,' which was the fruit of independent research, some of the materials never having been brought together before and others never used for the same purpose, that the distinctive capacity of the historian, as distinguished from that of the brilliant writer, most plainly appeared. And those who know what he could have done, and would have done, for the later periods of English mediæval history; how admirable was his insight into their life and feeling; how vivid their figures and events would have become under his pen, will never cease to regret that his career should have been closed when what he has done seems only an earnest of what he might have done with twenty more years of life.

The impression of great and varied power which his personality gave, rose even above the reputation his writings enjoyed in the world. His ill health and long absences from England made him seldom seen in London society; but those who visited him, even in the last two years of sickness and weakness, used to say that nowhere else in London did they hear such talk as in his little drawing-room at Kensington. The swiftness of his mind, its fertility in perceiving new points and setting a well-worn subject in a new light, was hardly more remarkable than the wealth of anecdotes and illustrations which rose at his touch. With a somewhat loose verbal memory, a memory which found it hard to retain a precise form of words, he had a very wide and ready memory for matters of substance. He was the best of story-tellers, dramatizing every incident so happily that you felt that the thing must have happened, or certainly ought to have happened, exactly as he related it. Unlike many famous talkers, he listened as well as he talked, and one great part of the pleasure his conversation gave was that it made the interlocutor feel raised above his ordinary level, so stimulating one's mind that one seemed to hit on better thoughts and apter expressions than one could at any other time.

He was a very keen politician, seldom taking any active part in politics, and, indeed, prevented in later years by his health from doing so, but caring intensely about the affairs of England and of Europe. Nothing ever interfered with his reading the newspapers, following and discussing everything that passed. Those who have read his History will not need to be told that in domestic politics he was a very decided Liberal, prepared, for instance, to go much further than almost any Englishman in the way of leaving Ireland to herself, while he had the warmest interest in and affection for America. He used to say that a historian of the English people had at least as much concern with what befell the English people west of the Atlantic after 1776 as with their fortunes on this side, and there were few more diligent students of American books and institutions. Y.

HEINRICH VON TREITSCHKE.*

BERLIN, February.

RICH as German historical literature has been of late, none of its publications has created more sensation than the second volume of Treitschke's 'Recent German History.' The author is valued as one of our most prominent and best prose writers, a patriotic man of great powers, and an able controversialist. In my opinion, he is an enthusiastic essayist rather than an impartial observer, and an aggressive and petulant party man rather than a cool and sober critic. His idiosyncrasies often make him an unjust special pleader; but, in spite of all these shortcomings, as a scholar he has gained great influence on our youth in a good and in a bad sense. It was he who early joined that contemptible anti-Semitic band in its attacks on our Jewish population, and who, by his reputation, gave a prestige to clownish court preachers, indifferent professors, dismissed officers, and other obscure gentlemen involved in debts and looking out for something to turn up.

Treitschke, as Professor of History at the Berlin University, has audiences of 400 to 500 students, and, although deaf, knows how to inspire them with his own enthusiasm. For long years the editor of the *Preussische Jahrbücher* (Prussian Annals), he formerly exclusively published valuable essays on public men of the present and the past, on constitutional questions and historical subjects. The collection of these essays belongs to the best class of our political literature, and has been published in three volumes and four editions. His great work, the 'History of Germany during the Nineteenth Century,' is to be completed in six heavy octavo volumes of about seven hundred pages each. Its first volume opens with a very able retrospective view of the old empire, characterizes the downfall and resurrection of Prussia, and closes with the Peace of Paris. The present one treats of the beginning of the German Confederation, and comprises only the three years from 1816 to 1819; but during this short period the foundation was laid for the reconstruction of Prussia and Germany. The intellectual movements and currents in literature, art, and science are delineated by Treitschke with a master hand. This chapter belongs among the best that have been written on the subject; it is catholic in its grasp, noble and inspiring in its tone and execution. Other interesting chapters, which largely increase the stock of our historical knowledge, are those treating of the Congress at Aix-la-Chapelle, the Karlsbad resolutions, and the reactionary movement in Prussia.

The author has had access to the Prussian archives, and found there a real treasury of unpublished documents, which throw quite a new light on that time and its leading characters. What some severe critics, and even his friends, blame him for is, that he has not correctly reproduced the printed authorities for his statements; that he has not loyally availed himself of his documentary evidence; and that even, here and there, he has distorted events in order to adapt them to his bias and preconceived notions. Three competent historians in particular attack Treitschke rather bitterly as an untruthful historical writer—viz., Prof. H. Baumgarten, of Strassburg, Const. Bulle, of Bremen, and A. Stern, of Berne. Their principal objections to his narrative are, that he mistakes the chief task of an historian—to make the times and characters of which he speaks understood and appreciated by their own spirit and in their own light. They exemplify his want of historical justice in several instances, and prove that he comments on persons and events in a pedagogic tone, and estimates them not according to their own time and character, but to a much later period and the author's prejudices.

It cannot be the function of your correspondent to enter into the merits of this controversy, or to comment upon the copious literature which has risen out of it. Besides the above objections, there is the Borussomania of Treitschke which pervades his work from beginning to end. Prussia, it is true, as has been proved by modern events, is the standard-bearer of progress, and the heart, the backbone, and head of Germany. Without her the great Fatherland would amount to as

* *Deutsche Geschichte im neunzehnten Jahrhundert.* Von Heinrich von Treitschke. Zweiter Theil. Bis zu den Karlsbader Beschlüssen. Leipzig: S. Hirzel. Erste Auflage, 1882; Zweite Auflage, 1883. 8vo, pp. 638.

little as the United States without New England and her Puritans. Dutch traders, French adventurers, broken-down English noblemen, and German farmers were not sufficient to create a great nation, or to make it a leading power of the earth. So it has been with us, only the materials composing Germany were different. Individual autonomy and self-government based on solid learning must rule supreme in the councils of a people to make it self-reliant, progressive, and aggressive. In this respect Prussia, on the whole, has, just like Massachusetts, been faithful to her task; but it would be unjust to others to keep silent about her many shortcomings and offences. Treitschke makes the great mistake of bestowing wholesale praise on everything which is Prussian and of vilifying everything which is not Prussian. To begin with, King Frederic William III., who was a prince of rather average ability, is represented as a model regent, a hero, and a great statesman. Whatever the other German princes do (I am far from admiring them) is wrong, wicked, and nefarious; Frederic William alone is wise, noble, and praiseworthy. Now, the influence which this King exerted on the destinies of Prussia and Germany has been a very baneful one. The greatest blunder he committed—if it was no more—consisted in his promising in the hour of need a constitution to his people (May 22, 1815), and then, after having beaten Napoleon a second time, with the unselfish assistance of Prussia, instead of keeping his promise, trying every means to evade it, and finally resuscitating the old feudal corporations instead of granting a modern representation to his people. Now, there would have been no better means to consolidate the hitherto disunited members of the reconstructed monarchy, and to make the different territories and provinces feel like one and the same body, than a constitutional government with equal political duties and rights. The King's breach of his promise, and his entering into a most reactionary path afterward, called forth storms like that of 1848.

Frederic William III., it must be admitted, was, left to himself, a well-meaning man, and of much sounder judgment than is commonly believed; but he distrusted himself and had neither faith nor belief in others. As a boy he had been ill-treated, and was consequently intimidated. Thus, he lacked initiative, asked the advice of all and followed none fully, did not confide in any one, and, with advancing years, retired from contact with independent, but honest, men, and then he more easily became a victim of intriguers and "faux bons hommes." These qualities of the King furnish the key to the Prussian policy from 1816 onward, which has been characterized as that of a hundred lost golden opportunities. Thus, without being aware of it, he was a mere tool in the hands of Metternich, who was the master spirit of that epoch, and humiliated Prussia before her nobler self and the world, in order firmly to establish the Austrian hegemony over Germany and Europe. My former letters on Bismarck in Frankfort will have shown you how long and shamefully this Austrian supremacy lasted, and what enormous efforts were necessary to destroy it. Sadowa was the concluding chapter of this unhappy part of Prussian history. It was wholly the fault of the King and of his Chancellor, Prince Hardenberg, that Prussia was so deeply humiliated; but Treitschke, wherever he can, does his best to whitewash them and to conceal the real springs of action. The American scholar, however, who feels an interest in the events of that time, will find, in a faultless German style, ample information and valuable instruction in the present volume. As the author is as sound a hater as he is an upright enthusiast, it will not be difficult to control him in rather doubtful passages.

Let me refer, in conclusion, to another mistake of Treitschke's which, although not relating to the great events of the time, will perhaps interest some of your readers who have known the man to whom I am alluding. I mean Charles Follen, one of the foremost and most intrepid abolitionists of Massachusetts, the Boston clergyman who perished in January, 1840, in the burning of the steamboat *Lexington*. Follen, as a young and enthusiastic student, had been one of the chief leaders of the "Burschenschaft," a radical association among the students which strove for political freedom and Republican institutions. At the head of the so-called "Black Brethren," he advocated the assassination of the perjured princes, was, consequently, driven out of Germany, and, by way of Switzerland and France, in the fall of 1824, went to the United States. Sand, when killing Kotzebue (1819), is said to have acted at the instigation of Follen. The victim was only a mediocre play-writer, but his death proved a great political event, as it was used by the so-called Holy Alliance and the Conservative German governments as a pretext for the introduction of the most reactionary measures. Metternich, gagging the free press and suppressing all free discussion and political societies, availed himself of the murder of Kotzebue for his plans. No more fortunate accident could have happened to him. Before Treitschke, only two contemporary writers have published their reminiscences of Follen. One of them was a dignified old gentleman, Friedrich Münch, of Marthasville, Missouri, who since 1834 had resided in that State, and died there some two years ago. Mr. Münch (whose *nom de plume* was "Far West") had been a fellow-student with Follen at Giessen, and was a great admirer of his genius. In 1872, when seventy-three years old, he published an interesting book, part of his memoirs, in which he praised Follen and defended his theories as just, those on the murder of faithless princes included. The other writer was Prof. Heinrich Leo, the late historian of Halle, who likewise had known Follen while a student, but not so intimately as Münch, and who told the same story, but tried to explain Follen's views by the excited character of the time. Out of these two statements Treitschke has concocted his sketch of Follen, by which he aims to prove that this gentleman was nothing else than a mean demagogue and the prompter of vile murderers. He describes him as a bloodthirsty and cowardly visionary, and accuses him of having been the cause of compelling the German princes to suppress free speech, free press, and free government. The exaggeration of this one-sided statement has been proved by Messrs. Baumgarten and Bulle. If any further refutation were required, it would be furnished by the later life of Follen, who was one of the most unselfish, patriotic, and noble men, and is, I trust, still esteemed as such in your country, too.

+++

THE CAPITAL OF NUEVA LEON.

MONTEREY, March 10, 1883.

THIS city is but a single railroad stride (170 miles) south of the United States boundary at Laredo, but it lies at an infinite remove from American idioms, ideas, and idiosyncrasies. It shows Oriental or Moorish peculiarities close at hand which many have travelled to Spain or Palestine in order to see. Indeed, it is in many points more Spanish than Spain, as Lower Canada is more French than France, both having been too distant to be electrified by the earthquake shock of the French Revolution. It was founded twenty-one years before the landing on Plymouth Rock. The public square (*Plaza Principal*) lies within a block of my hotel, the Iturbide. On the east are the cathedral and Bishop's palace; on the west the City Hall; south and north are coffee and ice-cream saloons. All the buildings are of bright colors. In the centre is a grand fountain, its central pillar buttressed by six colossal and well-cut marble dolphins. The water shoots up so high and so copiously that, whenever there is a breath of air, the spray irrigates an acre around. There are many parterres thickset with rose bushes now just budding. Walks meander among them mazily, and around two minor fountains as well. Encompassing this garden is a double line of trees, now mostly in full foliage: on the self-same orange bough I discover flowers and fruit full grown. Beneath every tree is a sort of stone sofa. Loungers abound, for in this latitude, 25° 40′, no man ever willingly goes into a house. The plash of the fountain water always lulls to repose. The cathedral clock strikes quarters; its eight bells are never done chiming while Lent lasts; and the cries of street peddlers, with trays of nondescript notions on their heads, are no less sonorous.

The Government-house on all its sides has the lower story arcaded after the fashion of the Doge's palace in Venice. Above the upper windows there are portraits of Mexican historical celebrities. In one of the rooms I was pointed to three muskets stacked in a glass case, and told that with these Maximilian was shot. At nightfall twenty-six men, each bearing a lantern, marched two and two into the porch. These were the night watch. Their lanterns may help them, like Diogenes, to find an honest man, but they are thought to help thieves more, by showing them what Dogberrys to shun. I am reminded of my Egyptian experience, when I was obliged to buy a lantern, as the Cairo landlord declared that the orders of the watch were to lie in ambush and shoot at every lanternless man they espied abroad in the nocturnal streets.

All Monterey is massively built, preëminently the cathedral. Its roof is like that of a bomb-proof, and has doubtless served as a battery on which to plant cannon. In front it has various carvings and five niches for statues of saints. The bell-ropes are tied to the clappers, and the bells are all rung without moving, except one, which has no rope at all, but is rung by being whirled over and over. From the cathedral roof I see mountain ranges jagged with just such saw-teeth as led the mediæval Spaniards to call them sierras. One notch toward the east, fitly named a saddle, is watched with special interest at a certain season, because the sun annually rises at that very point for a few days, as if eager, the natives say, to catch a view of paradisaical Monterey as early as possible. On the west, above two white churches on hills which serve for calvaries, or goals of pilgrimage, there towers a mountain cloven at top like a mitre, and accordingly so named.

The Iturbide Hotel was built for a convent, and is very much like the Hotel Dimitri, in Damascus. Its entrance front has no window, and few of its rooms have any, except transoms over their doors. Mine has a window opening on a side street, and fortified with iron bars only three inches apart, but projecting nine inches from the wall, like those in Florence, the *inginocchiate* invented by Michael Angelo. Thus I have a view up and down the street. But I am advised to leave nothing in my apartment lying around loose, as passers-by carry hooks which they throw in between the bars, and fish out whatever they can grapple at the end of their line. Of course my window has no glass and no sash in which to set any. Indeed, I am persuaded that the panes in the city are fewer than the houses. In many cases the same hole serves

both for door and window. The only store where I observed any glass hangs up for a sign the words, "Crystal Palace." The British window tax would have no terrors here. My walls —both the outer and inner—are twenty-seven inches thick. The ceiling is at least sixteen feet high, and is painted as if formed with a lattice of cane, showing a dark thatch through the diamond interstices. This is a reminiscence of the era when all roofs were made of cane and thatch, as those of the suburban peasantry here are to this day. The rooms have all their doors opening into an arcaded porch running round the four sides of a court, which is a garden of stately bananas and pomegranates, the latter now disclosing their coral red blossoms. In the centre is a vine-clad bamboo bower. On one side of the flat roof there is a series of upper-story rooms, and all around there is a pleasant promenade at morning and evening. No roof with a ridge-pole is visible, save at the railroad station. A few gigantic dagger-trees, or palmettos, and a pecan with a bamboo hut among its branches, are among the stock sights in the outlook. My own quarters have seemed worthy of these details because, with slight variations, they represent the whole city.

The manifest destiny of the Montereyans is either to vanish away as the American Indians and the old Californians have vanished, leaving room for the survival of the fittest, or on the other hand to become Americanized. I fear the former alternative will be their doom in the near future, and yet would gladly view their prospects more hopefully. It was pleasant to find a public library open every day, and free to all comers, established last year, and close to the chief place of concourse. It consists of only eighty-nine short shelves of books, though they are of fair quality, and more have been ordered. The worst sign is that I can count on the fingers of one hand all the readers I have seen there. By way of contrast, I see loungers standing two and two at every corner and door, wrapped in shawls which answer for vests, coats, cloaks, and, I suppose, beds as well, all day doing nothing and seeking nothing to do. At the most they smoke cigarettes, and, as some one has said, what hope can we have for the future of a people who in three centuries have been able to devise no better mode than that of getting the good out of tobacco? Monterey women almost equal the men in idly gazing along the streets, but they all stand behind the window-bars, like mice in a wire mouse-trap. A foreigner on first passing through the streets naturally asked, "Are the ladies here all in jail?" Again, there are public schools; but the throng of children playing around in school-hours betrays small attendance. There is also a Presbyterian Mission, and I have attended the Sunday service. All told, there were less than thirty in the auditorium: two American preachers, two Mexican lay exhorters, two female teachers from Iowa, about six Mexican men and women, and the rest children. Behold the result of ten years' work. How much for how little!

The Government, while Republican in name, is in fact a military aristocracy. The soldiers here, largely convicts, are estimated at fifteen hundred. A part of their business of late has been to shoot down at sight the Mexicans caught meddling with the railroad. Some of the natives are such thieves that they tear up the track to get spikes; others block the track through anti-American passion. When I visited the Bishop's palace on the suburban hill bombarded by Bragg, I found it garrisoned by 200 artillerymen. It seemed at first a hopeful sign that, as the commandant led me through the quarters, he showed me the telephone just set up there as a *buena cosa Americana*, and clearly viewed it as a jewel. But on second thought I felt that it was nothing less than a stern military necessity which had induced the adoption even of this Yankee notion.

The darkest sign in the Mexican as in the Irish horoscope is satisfaction with a low plane of living. The International Railroad hired multitudes of Mexican laborers for its construction. It paid them six or eight shillings a day, while before their wages were no more than three. Yet these laborers bought no better food or clothing than before, made no more provision for their wives and children, but wasted their wage increment well-nigh to a man in drunkenness and gambling, or bull-fights—for that venerable Spanish sabbatical institution still flourishes here at its best and fullest.

My letter is already too long, and still I have not alluded to the strangest feature of this place to Northern eyes—namely, the clearness of the air, such as that which made me, as I stood on the Mount of Olives, think the Dead Sea within an hour's walk, though I found it a day's ride. Among the strange aerial phenomena here I class the foot hills standing out so prominently that you think you can see round their corners and into the interspaces between them and the secondary ranges. The most distant peaks, too, seem pressing forward to peep over the shoulders of those nearer. Everywhere the lights and shades contrast no less than those of electric illuminators. On the whole, the atmospheric brilliancy surpasses whatever is known in the North as much as our Northern sky surpasses the London fogs, where men are forever doubtful whether their celestial luminary is the sun or the moon. J. D. B.

Correspondence.

PROHIBITION AND SOPHISTRY.

To the Editor of The Nation:

Sir: In an editorial comment on a letter written in defence of prohibition in Iowa, which appeared in No. 921 of the *Nation*, occurs this sentence: "The tendency to be uncandid and sophistical has always been a feature of the temperance agitation."

Do you not in this ascribe to one side of a particular agitation something which is an inseparable accompaniment to all agitation and to both sides of all agitations, and must necessarily be so, so long as the human mind continues to be liable to the prejudice of bias or to the falsities of bad logic? Neither pro-slavery nor anti-slavery, protection nor free trade, machine politics nor civil-service reform, has been free from the advocacy of uncandid and sophistical reasoning. And as for anti-prohibition, I would merely invite your attention to the following extracts from the communication which immediately followed the one above noticed, and which, passing as it did without editorial comment, appears to have excited no especial editorial disfavor:

"It must be universally conceded that if men were of their own volition to abstain entirely from the use of intoxicating liquor as a beverage, intemperance, with all the wretchedness, poverty, and crime it entails, would be completely eradicated. . . . The friends of prohibition declare that mere moral restraint has been found totally inadequate to govern and subdue the passions and appetites of men. This declaration . . . admits the inefficiency and futility of moral influence. It is tantamount to an assertion that the precepts and truths which are constantly inculcated in every civilized nation by the pulpit, the press, and the school are utterly destitute of practical effect. . . . So long as there is a demand for intoxicating beverages there will be a supply of them. The one chief defect of the prohibition plan is that it is directed against only the supply. . . . Large quantities of liquor are still sold and consumed in Maine, and the most watchful vigilance of the authorities is unable to completely suppress the illicit traffic."

Is there no lack of candor, no sophistry here? I believe it was Archimedes who said, "Give me a fulcrum, and I will move the world"? I will do better than this. Grant me such a stupendous "if" as the one contained in the first clause above quoted, and I will move the universe. This admirable discovery of a perfect method for the eradication of all woe would be equally true written thus: "If men were, *through prohibition*, to abstain entirely," etc. The writer has begged the question, and taken his own conclusion for granted from the outset.

Further, it appears either that prohibition must have many friends, or else some others than its friends have found "mere moral restraint inadequate to govern the passions of men"—else, whence our whole fabric of penal law? Are all these enactments tantamount to so many assertions that pulpit, press, and school are destitute of effect?

Then, as to supply and demand. Where should we strike an evil, if not at its source? Does liquor develop the appetite, the want, the demand, or does the untainted nature crave alcoholic stimulation so imperatively that it becomes tyranny for law to say, "This appetite must be suppressed as one detrimental to the general welfare, as one which in practice has been found to destroy a frightful proportion of those who gratify it, to work untold misery to innocent victims, and to double the amount of crime and the consequent necessity for courts and jails"?

It is only very partially true that the demand for liquor is what develops the supply. It is the excessive supply, pandering and appealing to the vices of men, that maintains and develops the demand. What demand produced the Northern Pacific Railroad? It was not the demand for transportation. The railroad had first to go and, by creating facilities, induce people to follow after it and avail themselves of those facilities. The railroad created a demand which had not previously existed. What produced the railroad was the demand for new fields of profitable investment by capital that foresaw the possibility of persuading people to go and make use of temptingly-displayed opportunities.

As to the exceedingly candid objection to the "regulation of private conduct," do anti-prohibitionists see any impropriety in the suppression of the trade in toy-pistols, or in obscene literature, or of the opium trade in China? Oh, no! but opium in China is so very different from alcohol in the United States! One class, who advocate free liquor, but punishment for drunkenness, would, if consistent, allow "the deadly toy-pistol" to be exposed for sale in every toy and candy store, and would then inflict what punishment the swift oncoming lockjaw left time for, upon every child that got wounded with one. They would have us leave the gilded temptation untouched, and stand ready with police, prison, and halter to deal with those who find themselves, when once lured in, too weak to struggle free from the everywhere-present toils.

Finally, I ask attention to the last of the quoted clauses. Alas for the writer! He proves altogether too much. The same is true, to the letter, of counterfeit coin, smuggled goods, and of the "illicit" practices of gambling, swindling, stealing, murdering, and many others. But somehow this admitted fact has not led us to do away with our laws and our "watchful vigilance" against these things, and to trust wholly to the powerful influence of the pulpit, the press, and the school to morally persuade men to be-

have themselves, and regulate their private actions in accordance with public welfare. "These things [laws and penalties] ought ye to have done, and not to leave the other [moral suasion] undone." HENRY G. REYNOLDS.

OLD MISSION, MICH.

[The letter in question we thought valuable because it called attention to the fact that moral suasion has been more successful than anything else in preventing *excess*. In most fields of consumption or activity, men are kept moderate by advice and argument, or by observation of the effects of over-indulgence. Even in the matter of drinking, these agencies have done a great deal among certain classes, both in this country and in England. It is very useful, we think, to keep prohibitionists in mind of this, because their tendency is to forget it. They forget it because in their zeal they forget that it is against excess they are fighting. They advocate prohibition not because they hold that all use of alcoholic drinks is wrong, but because they hold that it is only by total abstinence that excess can be prevented. Having forgotten this, they readily fall into the fallacy of considering criminal all use of anything which may be abused, and then indulge in the preposterous fallacy of putting wine-drinking in the same category with counterfeiting, gambling, and fornication. As the least counterfeiting or gambling or unchastity is wrong and ought to be punished, they declare that the least wine-selling is wrong and ought to be punished. Having got as far as this, of course all the rest is easy, and they ask, with exultant absurdity, why you complain of the inefficiency of the liquor laws any more than of the inefficiency of the counterfeiting, gambling, and fornication laws. But they cannot maintain that a practice in which the best men of the human race have indulged in all ages is wrong even in moderation, any more than they can maintain that it is no harm to counterfeit or gamble or fornicate a little. —ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: It is difficult for us always to avoid the sins we find it easy to charge upon others. We are all prone to slip; and when a writer starts out with a flourish to impute to some luckless wight, who may have had the misfortune to differ from him on a question of more or less importance, an inaccuracy of statement or a slovenliness of argument, I invariably follow him with trembling, for it is ten to one that his own discourse will furnish illustration of the very faults he castigates.

A good example of this tendency may be seen in No. 924 of your journal, where, with dignified complacency, the communication of Sylvan Drey accuses Mr. Ernst Hofer of "sophistry." The writer seems to have confused in an astonishing manner the provinces of constitutional and statutory law. It appears never to have occurred to him that many things are beyond the power of the legislature which yet the people may control. There is no force in saying that what has not been committed to the legislature at all is "not within legislative competency." But to say that the body politic has no power by police regulation to prohibit any traffic that the body politic deems subversive of its order, detrimental to its prosperity, inimical to its happiness, and injurious to its morals, is to place one's self in ridiculous opposition not only to a long line of judicial opinions, but even to the specific concessions of the most punctilious publicists that have championed the cause of alleged "personal liberty." Mr. Drey should bear in mind that there is a marvellous distance between "*legislative* competency" and the "right of a *State*." C. A. TOWNE.

LANSING, MICH., March 19, 1883.

OREGON AND THE LOUISIANA PURCHASE.

TO THE EDITOR OF THE NATION:

SIR: The note from President Walker with the above heading has received considerable attention. The subject is one of no small consequence to the student of history. Undoubtedly the publication of the historical map in the "Statistical Atlas," enlarged from Mr. Stocking's map in the census of 1870, created considerable surprise in the minds of many students of history, since there is no good ground for including Oregon as a part of the "Louisiana Purchase." General Walker says in his note: "'The Oregon question' was not one which there had ever been occasion for me specially to investigate." It would, perhaps, have been fortunate if an investigation had preceded the publication of the "Historical Map."

In 1824, our Minister to England, Mr. Rush, based our claim to Oregon, first, upon "the proper claim of the United States by discovery and settlement; and secondly, as *now standing in the place of Spain, and holding in their hands her title*"* (that is, by the Florida treaty). Mr. Rush did not even *mention* the Louisiana purchase. But General Walker quotes (from memory) Mr. Gallatin. Mr. Gallatin and Mr. Rush carried on negotiations upon this subject with Great Britain in 1818, before our purchase of Florida, and before Spain had quit-claimed to us her right to Oregon. At that time we had never claimed that our title to Oregon was perfect. Messrs. Gallatin and Rush reported to our Government that they "did not assert that the United States had a perfect right to that country, but insisted that their claim was at least good against Great Britain."†

In 1845 Mr. Buchanan asserted that our claim to the country was *perfect*. He said: "Our own American title to the extent of the valley of the Columbia, resting as it does on discovery, exploration, and possession—a possession acknowledged by a most solemn act by Great Britain herself—is a sufficient assurance against all mankind, *whilst our superadded title derived from Spain* extends our exclusive rights over the whole territory in dispute against Great Britain."‡

The following authorities, among many others, may be quoted as against the view that Oregon was a part of the Louisiana purchase: (1) The French Government, (2) the British Government, (3) the Spanish Government, (4) the United States Government, (5) Mr. Jefferson, (6) Mr. Gallatin, (7) Mr. Rush, (8) Mr. Buchanan, (9) Mr. Caleb Cushing, (10) Mr. Greenhow, (11) Mr. Clay, (12) Mr. Benton, (13) Mr. John Quincy Adams, (14, 15, 16) three distinguished English authors upon the subject—Travers Twiss, Thomas Falconer, and John Dunn, and lastly (17) M. Marbois. As to M. Marbois's opinion, a quotation somewhat at length will surely settle the question. After discussing freely with the American ambassadors the difficulties attending a definite statement of western and northern boundaries, he said to them:

"Is it not better for the United States to abide by a general stipulation, and, since these territories are still at this day, for the most part, in the possession of the Indians, await future arrangements, or leave the matter *for the treaty stipulations that the United States may make with them and Spain?* In granting Canada to the English, at the peace of 1763, we only extended the cession to the country that we possessed. It is, however, as a consequence of that treaty that England has occupied territory to the west as far as the great Northern Ocean." . . . "It is," he adds, "in fact important not to introduce ambiguous clauses into treaties; however, the American plenipotentiaries made no more objections, and if, in appearing to be resigned to these general terms through necessity, they considered them really preferable to more precise stipulations, it must be admitted that the event has justified their foresight. *The shores of the Western Ocean were certainly not included in the cession, but the United States are already established there.*"

This quotation is from Marbois's 'History of Louisiana,' translated "by an American citizen," and published in Philadelphia, by Carey & Lea, in 1830, pp. 285 and 286. This explains fully what is meant by General Walker's quotation: "Accroissement des États-Unis *par le traité et* PAR SES EFFETS."

WILLIAM A. MOWRY.

PROVIDENCE, March 26, 1883.

ARMS-CARRYING AND MURDER.

TO THE EDITOR OF THE NATION:

SIR: There seems to be an assumption running through your Southern correspondents' letters on the subject of homicide that carrying of arms necessarily develops that species of brutality (begging pardon of the brutes). It is not necessarily so. In Montenegro, where civilization is almost in its patriarchal state and law scarcely crystallized, every man from twelve or fourteen to old age goes armed with knife and pistols; and where the gravest degradation which can be inflicted on a man by authority is to deprive him of his arms (equivalent to disfranchising him with us), personal conflicts and hot-blooded murders are very rare, so much so that during nearly three years that I was in the country, most of which time was spent with the army, I never saw a personal rencontre, and only heard of one murder of the kind so popular in our Southern States. Yet the sense of honor is quite as fine as with our Southern chivalry, and the duel is in extreme cases permitted, but only by the direct assent of the Prince and a kind of legal settlement with due formalities. I remember one day that when the Prince had decorated a man for an act of personal daring, one of his neighbors approached the former and said that he thought that he was as brave and as deserving the medal as the other. "Go and say to him," replied the Prince, "that you are a braver man than he, and I will give you the medal." This is equivalent to a challenge, and must have been followed by a duel, and the man declined the test; not because he was afraid, but because there was no provocation. And the Prince knew his man so well that he chose this as the simplest way of refusing the demand for a decoration perhaps not earned.

The immunity from acts of violence is in curious contrast to the condition of the adjoining Austrian provinces inhabited by the same race, where murder, the vendetta, and general lawlessness cannot be repressed even by Austrian military rigor. The reason why in Montenegro murder is so rare is that the law is practically inexorable, and certain to fall on him who is the author of an unjustifiable homicide. The value of the life of a man is too great to be left to the chances of passion, and he who provokes wantonly a rencontre in which his adversary is killed is treated as a murderer. Every man in the

* Twelfth conference between the plenipotentiaries, June 26, 1824, as annexed to the President's Message to Congress, January 31, 1826.

† Sir Travers Twiss, 'The Oregon Question Examined,' p. 202.

‡ Letter of Mr. Buchanan, July 12, 1845.

community knows that escape from justice for any crime of violence is possible only by instant self-exile; he has no wish to spend the remainder of his life in that state, and so learns to restrain his passion and keep his revolver in his belt. If public opinion in the South could be educated up to the Montenegrin point, it would recognize every man who goes about to provoke a quarrel as a ruffian and bravo, and every weaker one who condones these savageries as an imbecile and unfit to exercise the duties of a citizen, and then a recognition of law would become possible. The men of the South who have not the courage to hold up their heads and speak boldly against the ruffianism in their midst are primarily responsible for a state of things which does more to damage the reputation of our country than even repudiation. I remember once being on shipboard with a Dalmatian captain who traded all over the world, and who preferred to sail to any port rather than one of the United States of America. His reason was that he believed, and had always heard, that in all the streets of the American cities there was the imminent danger of a pistol affair on any pretext. It is nonsense to talk of the patriotism of men who will not, for the honor of their country, encounter the scowls or insults of the bravoes of their community by daring to raise their voices against barbarisms which no country can tolerate and be called civilized. W. J. Stillman.

Florence, March 9, 1883.

UNCUT EDGES.

To the Editor of The Nation:

Sir: Will you permit one of your subscribers to offer a protest against an abuse of the critic's and student's time and patience which is getting a little too heavy to bear?

In the time of poor Queen Anne there was a heavy tax on glass, and very little sunlight in Great Britain, so nobody felt greatly aggrieved that windows were small and window-panes smaller. Now that the æsthetic craze induces the fashionable public to revert to a fashion which was simply a necessity when it originated, it is found convenient to forget the original "why" and "wherefore." A very few years ago the reading public of the United States congratulated themselves that the invention of a certain machine made it possible to cut the leaves of all books, papers, and magazines without increasing their cost. But the vanity of mankind and the æsthetic craze have already united to demonstrate that this congratulation is premature. Scarce a book has come from the press this year that does not need to be painfully cut leaf by leaf; and the time so employed must be subtracted from that bestowed on the reading by every critic.

In good Queen Anne's time, it was as little to be objected to as the small panes of glass. Her Majesty could not spell, and her subjects did not read. The aristocratic class who satisfied their literary longings by collecting libraries, rebound the issues of the press for their own shelves, as their descendants still do. But in the United States of America it is the *people*, not the aristocrats, who read; and the people are active artisans or merchants, who have no time to spare, and, like the critic, grudge every second to the paper-knife. Let me speak for myself. I am too conscientious to review with a paper-knife or my fingers' ends; and this winter, from this cause alone, I have found it impossible to keep up with my work. Let publishers understand that it will never pay in this country to provide for the wants of the book-fancier alone.

Yours very truly,

Caroline H. Dall.

Washington, D. C., March 21, 1883.

Notes.

Irving's centenary falling this year, G. P. Putnam's Sons have in preparation a memorial edition of Mr. Pierre M. Irving's 'Life and Letters' of his uncle. It will be of quarto size, and elegantly manufactured in every respect, with three specially engraved portraits (in addition to many others heretofore published), namely, of Washington Irving at twenty-one, from a recently discovered miniature; of Matilda Hoffman, his fiancée, and of the late George P. Putnam. The three volumes will appear during the months of April and May, and but 300 copies will be printed.

To the uniform edition of Dr. O. W. Holmes's works, now being published by Houghton, Mifflin & Co., will be added 'Medical Essays' and 'Pages from an Old Volume of Life,' which combine various essays, professional and metaphysical, already published under other titles, with some quite new ones.

Lee & Shepard will issue next month a volume of poems by the late Marc Cook, known to magazine readers by his hopeful article on "The Adirondack Cure" for the disease to which he succumbed last October. As a verse-writer, he was accustomed to use the *nom de plume* of "Vandyke Brown." One of his poems, "Nothing New Under the Sun," was included by Mr. Dana in the latest edition of his 'Household Book of Poetry.'

Besides a new edition of the popular novel, 'Mr. Isaacs,' Macmillan & Co. announce for immediate publication a new edition of Dr. Martineau's 'Study of Spinoza' and a new translation of 'Spinoza's Ethics,' made by Mr. Hale White, with the advice and assistance of Mr. J. Hutchinson Sterling, of Edinburgh. A one-volume edition of Miss Yonge's new story, 'Stray Pearls,' and a new novel under the title of 'The Story of Melicent,' by Fayr Madoc, are also just ready.

E. P. Dutton & Co. announce for publication, by arrangement with the London publishers, Rosmini's 'Five Wounds of the Church,' by Canon Liddon; and a revised edition of Blunt's Annotated Prayer-Book, with American preface.

Messrs. Sweet & Knox, editors of *Texas Siftings*, will publish in the form of a subscription-book, through S. S. Scranton & Co., Hartford, Conn., their serial narrative, 'Through Texas on a Mexican Mustang,' begun in their paper last May.

Dr. Dix's much-criticised Lenten 'Lectures on the Calling of a Christian Woman' have been gathered into a volume, and cheaply yet tastefully published by D. Appleton & Co.

Harper & Bros. have added to their Franklin Square Library 'The Wreck of the *Grosvenor*,' and Mr. S. S. Cox's 'Why We Laugh.'

'The Statesman's Year Book' rounds its twentieth year in the publication for 1883 (Macmillan). Its founder, however, the late Frederick Martin, was obliged to relinquish the editorship in December last, and died near the close of the following month. His successor, Mr. J. Scott Keltie, assumes his new task with modesty, and desires corrections and suggestions. The modifications observable in this important annual are as usual extensive. Brazil is a prominent example. The four lines on p. 583 concerning the school census of the United States contain at least three errors, one very serious. The number of schools in 1880 is represented by a figure retained from the last edition (where it was attributed to the census of 1870), and is nearly twice too small—141,629 in place of 225,880. The number of teachers, on the other hand, is considerably overrated; the total "enrolment" of school-children falls short by 265,000 of the total *attendance* reported by the census. The list of non-official publications relating to this country is susceptible of improvement.

Mr. Christern sends us Louis Figuier's 'L'Année Scientifique et Industrielle' for 1882 (26th year). Under "Arts of Construction" we read among other things of the plans for making Paris a seaport by canal or by widening and deepening the Seine, and of the new French railroad enterprises on the upper Senegal; under "Public Hygiene" is given a review of the progress of cremation, the world over, Italy being foremost among Christian nations; under "Medicine and Physiology" the details of Gambetta's illness and death, and the Paris census for 1881, find a place. The population of that city has grown from 547,700 in 1801 to 2,225,902 in the year first named. The census of France for 1881 by departments is subjoined, together with an interesting discussion of the movement of population. "Speaking generally, the deaths exceed the births in the cities which may be regarded as centres of industry, pleasure, and diverse passions, and the births exceed the deaths in the country districts, which are centres of reparation. Nevertheless, the cities are populated while the country districts are depopulated." Under "Agriculture" we are told that it is already settled that the planting of American vines will be the salvation of France, and that the number of available varieties is rather scanty. The necrology of this instructive volume is as usual full and valuable.

Submarine telephoning forms one of the sections in the annual just noticed, the two experiments described being between ship and shore, but neither being satisfactory. We think there can be little doubt that recent improvements of instrument and wire in this country point to a time when by Atlantic cable the Old World can readily converse with the New. Till that day arrives Americans have hardly more than a curious interest in the brochure issued by Paul Dupont, Paris, for the Compagnie Internationale des Téléphones, entitled 'Situation des Réseaux Téléphoniques,' or 'Established Telephonic Networks.' A short introduction describes the various conditions of the telephonic system in different countries—according as it is free or more or less under the control of the state—and then follow tables for the globe and for its several parts, showing for the world at large 303 towns and 78,808 subscribers in communication. The numbers for America, chiefly the United States (126 towns, 47,185 subscribers) seem to us too small, but the pamphlet enumerates all the companies who have furnished the desired particulars, and who probably cover the major part of the field. The accompanying statistics show subscription fees and charter privileges, town by town and company by company. The telephone has found its way to Honolulu and the principal cities of Australia.

M. Jules Lévy is republishing in his *Français* (Cambridge, Mass.) a pamphlet on the Madagascar question, which appeared last year in Paris, from the pen of J. Brenier. Timeliness also belongs to the 'Concise Grammar of the Malagasy Language,' by G. W. Parker, just added to Trübner's "Collection of Simplified Grammars." This language possesses an exceptional interest. It was made a written tongue by British missionaries, has furnished a translation of the Bible, and in sundry ways shows the influence of the Arabs, the French, and the English. Its literature proper, as we indicated last week in our notice of the *Folk-Lore Journal*, well repays study.

J. B. Lippincott & Co. are the American agents of the new Tory monthly, the *National Review*. The first (March) number has a well-

mixed table of contents, and is handsomely printed.

Mr. Arthur B. Turnure, 132 Nassau Street, has begun publication of a monthly eight-page quarto, called the *Art Age*. Its rubricated initials, column rules and dashes, and its elegant typography, symbolize the object of this periodical, which is, if we understand the editor's "General Argument," to glorify the products of our best American presses. As we have a specimen page from Abbey's Herrick, it is probable that borrowed illustrations will continue to be a marked feature of the *Art Age*. The scheme is not wholly uncritical, and is partly literary.

Mr. Foster's *Monthly Reference Lists* for March has for its two topics Richard Wagner and the Georgia Sesqui-centennial (F. W. Leypoldt).

Drs. J. M. Charcot and P. Richer contribute to the January number of the quarterly *Journal of Nervous and Mental Disease* (Putnams) a very instructive article showing the cerebral connection between physiognomy and gesture. This is done by means of experiments on a cataleptic patient, the appropriate gesture *following* the localized faradization of the facial muscles to express astonishment, anger, mirth, etc. Four excellent photographs taken under these conditions complete the demonstration. A portrait of the late Dr. Geo. M. Beard accompanies this number of the *Journal*.

We have received the eleventh annual report of the Fairmount Park Art Association (Philadelphia), and the 'Visitors' Guide to the Collection of Birds in the American Museum of Natural History' (Central Park). Both these pamphlets have a more than local interest, for each is a record of and an incentive to public spirit.

President Barnard's 'Perpetual Calendar' (G. P. Putnam's Sons) is a very simple contrivance, though less convenient than similar calendars for limited periods, because when in use the year at which it is set is not so obvious. We think, too, that the explanation on the back should give illustrative examples.

Prof. Birbaum, of the Ladies' High School in Heidelberg, has put forth a compendious 'History of the English Language and Literature' (New York: Westermann), one chapter of which, on 'The North American Literature,' we have found sufficiently amusing. The author's young ladies are to be congratulated on the exclusive information contained in the following passage, which concludes an account of the establishment of the republic under Washington: "Yet one stain should disfigure this splendid national edifice—the execrable slave trade. Owing to the strenuous efforts of William Wilberforce, it was finally abolished in 1807 (Abolition Act of Slavery), although the complete emancipation of slaves was only carried out in 1833." A little later we read, under the head of "Dramatic Poetry": "After him [George H. Boker] the names of Warner, *Gilded Age*, and William D. Howells, an imitator of French plays, stand out the first." The climax is capped when it is stated, of Dr. Holmes, that "of his numerous poems [*sic*] may be mentioned *Bread and Newspaper*, *My Hunt after the Captain*, *Sun Painting and Sun Sculpture*, and *Doings of the Sunbeam*"!

We have already noticed (*Nation*, No. 893) the first parts of the 'Handbuch der theologischen Wissenschaften,' edited by Dr. Otto Zöckler (New York: Westermann). The third half-volume is now before us, issued designedly out of order, since it is the beginning of Vol. III. The other half, with the whole of Vol. II., is promised in the course of the year.

An "Allgemeines historisches Porträtwerk," to be issued by Fr. Bruckmann in Munich, will form a good accompaniment to R. Gottschall's "Der neue Plutarch." Six hundred phototyped portraits of persons of all races and classes since 1300 are to be issued with some biographical data. There will be 12 series—viz., 1, 2, Princes and Popes; 3, 4, Statesmen and Warriors; 5, 6, German Poets; 7, Non-German Poets; 8, Artists; 9, Musicians; 10, Learned Men and Reformers; 11, Women; 12, Various.

In the Note upon Wordsworth in our last week's issue, a slip of the pen gave his sister the name of "Mary" instead of Dorothy.

—The *Atlantic* contains the first act of a dramatization of "Daisy Miller" by Mr. James. There are to be three acts, and the story in its dramatic form will be, of course, more elaborate than the original sketch. It would be premature to pronounce an opinion upon its dramatic merits in its present uncompleted state, but the experiment will be watched with interest, for many reasons—among others because it will, if successful, enrich the somewhat poorly provided American theatre with two new types in Daisy and Randolph C. Miller. In the first instalment there is very little action, but the dialogue is bright, and in the hands of really competent actors, as we know from so many of Robertson's plays, dialogue may be made to take the place of action. Mr. Warner has an essay on "Modern Fiction," in which he makes a protest against the novel of analysis and introspection, and hints that "most of us" are "ready for a more ideal—that is to say, a more artistic—view of our performances in this bright and pathetic world." The names of Cooper, Scott, and Lever suggest themselves at once as illustrations of the kind of novel that idealizes life, and touches it with poetry, and makes it seem like what it is at its best moments. Mr. Warner reminds us of Hawthorne, too, as a proof that, out of the materials afforded by American life, the imagination may weave romances of the first rank. He may also be cited to show that there is no necessary antagonism between introspection or analysis and idealism. It is, however, almost impossible to conceive of the work of any of the novelists we have named being done over again, and Mr. Warner himself does not suggest any way in which we can hope to escape from the atmosphere of realism which is the peculiar characteristic of modern art and modern life in so many directions. In an article on the "Bacon-Shakespeare Craze," Mr. R. G. White make mince-meat of Mrs. Pott's recent publication, and goes so far as to express the opinion that it is not of the least consequence in the world whether "Hamlet," "Lear," and "Othello" were written by Francis Bacon, William Shakspere, or John Smith, "so they were written by an Englishman in London, between the years 1590 and 1610." In other words, the value of the plays is just as great no matter who wrote them. This is very true; but though the plays, as such, would remain, our ideas of Bacon would be materially affected by finding that the "wisest, brightest, meanest of mankind" was the greatest dramatist the race has produced. His life would have to be entirely rewritten, and the discovery would be made the basis of many a novel and important literary theory. In this way Mrs. Pott's discovery would, if there was any truth in it, be a highly important revelation.

—The *Century* for April contains the concluding chapters of Mrs. Burnett's "Through One Administration," a tale which may be regarded as the latest attempt at producing the typical American novel. We shall defer any discussion of the plot as a whole until the story appears as a book. The work may be commended to the foreign critic of American fiction and manners. Unless we are greatly mistaken, it will puzzle him a good deal. It should be studied by him in connection with 'Democracy,' a novel which has, however, a considerably more European flavor. What is to be said of the country which produces such books as these? What of its social aims and ideals? What of its political system? What of its intersexual code? A good deal of solid work is cut out for the critic in "Through One Administration." Anglers will be interested in an article on the "Primitive Fish-hook," by Barnet Phillips, who traces its development from the palæolithic fish-gorge to the perfected hook of to-day. Mr. Stedman has a critical essay on Emerson, which is "appreciative," but occasionally bewildering. "His philosophical method," says Mr. Stedman gravely, "bears to the inductive or empirical a relation similar to that between the poetry of self-expression and the poetry of æsthetic creation—a relation of the subjective to the objective." This is not a very clear distinction. Mr. Stedman appears to be really of opinion that Emerson had no philosophical system at all, but took whatever he needed of philosophy where he found it: from Plato, from Aristotle, from Swedenborg, from Fénelon, from Montaigne, from Marcus Aurelius, or from the last Brown, Jones, or Robinson who had turned up as the "coming man" at Concord, Mass. As to this, there can be no dissent; still, if he had no philosophical system at all, what has the distinction between the poetry of self-expression and that of æsthetic creation to do with the explanation of his "philosophical method"? The former kind, of course, often is the more "spontaneous, since it has its birth in the human need for utterance. It is the cry of adolescence and femininity, the resource of sensitive natures, in which emotion outvies the sense of external beauty and power. It was the voice of Shakspere's youth, nor was it ever quieted throughout the restless careers of Byron, Heine, and De Musset." These are very queer associates for Emerson, whether we regard him as a poet or a "seer," yet, to clinch the matter, Mr. Stedman adds, "as with the subjective poets, so with many of the transcendental acolytes." The secret of Emerson's influence will, we venture to predict, as time goes on be found to have consisted largely in the fact that he opened the long-closed doors of New England to what we now call "culture," and preached to a generation which was habituated to preaching of a very different sort, and longing for a freer and healthier life, the worship of the true, the beautiful, and the good. It was not a system of philosophy that he preached. New England was dried up with systematic teaching. His creed was the negation of creeds, a protest against systems. In so far he was "subjective," but the stern necessity of his "environment" made it impossible for him to get along without a systematic nomenclature, and the term transcendental was invented to meet this local peculiarity.

—*Lippincott's* for April contains an unusual number of "solid" articles. Mr. E. V. Smalley contributes a good deal of information on the subject of "The German Element in the United States"; Mr. Philip G. Hubert, jr., writes on Wagner; and "L. D." criticises Mr. Freeman's recent remarks on "American Speech." "L. D." by no means agrees with those of Mr. Freeman's critics in this country who thought that the historian's views of our way of using English were, considering the shortness of his visit here, just and accurate enough. On the contrary, he undertakes to show a number of instances in which Mr. Freeman has made blunders, and, further, that his own speech is by no means absolutely correct, but rather slipshod and slovenly. What, for example, are we to think of a critic who not only

is frivolous enough to suggest that we say "on board" a train of cars because our cars suggest to the mind the "cabin of a steamer," but has the audacity to write, in defiance of Lindley Murray, of the American "car," that "it is quite unlike the special meaning attached to a carriage"? A car unlike a special meaning! Shall we submit to criticism from such a source? Mr. Freeman, speaking of the habit of calling New York a "metropolis," thinks that it is not easy to guess in what sense the word is used, "as it can hardly be because it is the seat of a Roman Catholic Archbishopric." Did Mr. Freeman, inquires "L. D.," ever try to guess why a certain line of railway in London is called "Metropolitan"? The "Climate Cure" is discussed sceptically by Mr. Frank D. Y. Carpenter, who thinks that doctors, consumptive invalids, and hotelkeepers are in a conspiracy to represent certain places as "sanitariums," when the truth is that nobody knows whether they kill or cure. Florida, says Mr. Carpenter, ought to be called Euthanasia; Santa Barbara is becoming noted for the prosperity of its undertakers, etc. His advice is to get the nearest dry, pure air that can be had, and abandon all idea that a long journey in search of a new climate is necessary. Massachusetts physicians, we believe, have acted on this view of the matter, and sent consumptives from Boston about a couple of hours inland to the high country about Worcester.

—*Harper's* opens with a readable article on "English Farmers," by Mrs Phœbe Earle Gibbons, in which the writer draws a rather neat sketch of the ordinary English farm interior—so different from anything that could be found in this country. Mrs. Ford, the farmer's wife, reminds the reader a little of some of the characters in George Eliot's novels. She has heard of America, but having heard also of Australia, is apt to confound the two. She inquires of Mrs. Gibbons what means of education we have in the United States; and on learning that means exist, she says that she "thought not"; but adds reflectively that "perhaps it was Australia of which she heard this." With reference to the depression in farming she thinks the Irish troubles are "doing us good." Speaking of American cheese, it occurs to Mrs. Ford "how easily we might poison them" with this article of export—a suggestion which throws a side light upon the popular feeling in Germany as to the American pig, lately utilized in the interest of protection. Mrs. Ford has an old uncle and aunt, and Mrs. Gibbons's laughing and talking lead her to suggest a visit to the old people, on the ground of their interest in America, not as the land of freedom, but as the home of "funny things." There is plenty of American history in the magazine, and it looks as if the supply would not soon give out, for Mr. George Ticknor Curtis furnishes an illustrated article on "The Treaty of Peace and Independence," bearing the ominous number which indicates that others are to follow, and Mr. T. W. Higginson has an account of the Jamestown settlement and other related matters. Mr. Boughton's instalment of "Artist Strolls in Holland" contains a number of charming pictures. The frontispiece of the magazine is a portrait of Irving, about whom Mr. Curtis has a few pleasant words to say in the "Easy Chair," suggested by his approaching centenary. As Mr. Curtis says, Irving's position in literature is "assured"; but, unless we are mistaken, there is a good deal of doubt just now as to its exact nature and magnitude. Was he a great writer, or are his style and matter a little too literary and imitative? Was even his humor original? In another hundred years the world will have made up its mind on these points.

—The address on mental discipline recently delivered by Professor Huxley before the Liverpool Institute clearly defines what, in the estimate of that scientist, ought to constitute the groundwork and body of a substantial English education. Apart from its numerous wholesome suggestions, which, as coming from so eminent and experienced an authority, cannot fail to carry considerable weight with them, the address is particularly interesting as it corrects many fallacies that have currently obtained concerning Professor Huxley's "peculiar" views in this direction. After dwelling upon the practical value of instruction in physical science, and its superiority to any other study as a mental discipline, the speaker (as reported by *Nature*) laid special stress upon the fact that he was no advocate of the exclusion of other forms of culture from education, but, on the contrary, insisted that it would be a serious mistake to cripple them for the sake of science. He had no sympathy, he said, with a kind of sect or horde of scientific Goths and Vandals, who think that it would be proper and desirable to sweep away all other forms of culture and instruction except those in physical science. As to the material of education or learning, Professor Huxley adds: "It is not a question whether one order of study should predominate or that another should. It is a question of what topics of education you shall select which will combine all the needful elements in such due proportion as to give the greatest amount of food and support and encouragement to those faculties which enable us to appreciate truth, and to profit by those sources of innocent happiness which are open to us, and at the same time to avoid that which is bad and coarse and ugly, and to keep clear of the multitude of pitfalls and dangers which beset those who break through the natural and moral laws." After dwelling upon the worthlessness of the literary education hitherto dispensed by the English schools, the speaker stated, that if he "could make a clean sweep of everything, and start afresh, he would in the first place secure the training of the young in reading and writing, and in the habit of attention and observation both to that which is told them and that which they see; and he would make it absolutely necessary for everybody, for a longer or shorter period, to learn to draw—and there is nobody who cannot be made to draw more or less well." Besides the studies that might be considered strictly scientific, and such as pertain to pure literature, ancient no less than modern, Professor Huxley urges the necessity of a proper training in the history and geography of the mother country—"not as a mere chronicle of reigns and battles, but as a chapter in the development of the race and the history of civilization"—and in the sadly neglected theory of morals and of political and social life, "which, strangely enough, it never seems to occur to anybody to teach a child." . . . "Finally, I would add instruction in either music or painting, or, if the child should be so unhappy, as sometimes happens, to have no faculty for either of these, and no possibility of doing anything in an artistic sense with them, then I would see what could be done with literature alone; but I would provide in the fullest sense for the development of the æsthetic side of the mind."

—In a recent number of this journal the rather frequent abuse of postdating literary publications was animadverted upon. The mercenary reason for such practice is obvious. Antedating, however, also occurs, especially in Germany, where the issuing of works in instalments, or parts forming no separate volumes, is common. Generally the title-pages of such books are printed when the volumes are completed, and thus partial postdating takes place; but occasionally the title-page is issued with the first number or part, bearing the date of the beginning of the publication, though this may require years for its completion. The 'Universal History,' edited by Professor W. Oncken, and published by G. Grote in Berlin, a publication of equally great dimensions and merit, offers several examples of such antedating. The advantage that may possibly arise from it is not perceptible. The disadvantage to the publisher is clear. Thus Dümichen's 'History of Ancient Egypt,' which is the first book in this collection, bears on its regular title-page the date 1878, and it is only half completed. When offered for sale, a year or two hence, as an independent book—which each work of the collection is—it will be considered a rather old publication. Nearly the same is the case with Lefmann's 'History of Ancient India,' begun in 1879, and still incomplete, and with several other component parts of the 'Universal History.' Many a reader of Dümichen's 'Egypt,' not aware of the way in which it appeared, will be surprised to find in a book dated 1878 references to works published in 1880, 1881, or 1882. The author will, of course, in this respect have the advantage over writers whose publications, bearing the date of completion, expose them to the reproach of unfamiliarity with the latest authorities on their subjects. The learned contributors to Riehm's 'Handwörterbuch des Biblischen Altertums,' for instance—a work in one large volume, begun in 1874, and probably to be dated 1884—will be made responsible by many a reader for their ignoring, in such articles as "Assyria" or "Babylonia," things discovered and made known a number of years before the date of the publication. It appears to us that, in justice to author, publisher, and buyer, volumes the issuing of which takes several years ought to indicate on their title-page the dates both of the beginning and the completion. Thus Riehm's 'Handwörterbuch,' if finished next year, ought to be dated 1874–1884. The practice of partial antedating, however, ought to be entirely abandoned. We have before us a small encyclopædia—Kliushnikoff's, published in St. Petersburg—embracing events down to 1882, and dated 1878. Its publishers must be losers to a great extent by this mistake. Why was not a new title-page added to the last instalment, dated 1882, or, more properly, 1878–1882?

—Friedrichs's 'Bausteine' is a running commentary on the collection of casts from the antique in the Berlin Museum. The collection is probably the best of its kind in the world, and Friedrichs's critical authority is of the first order. Mr. D. Cady Eaton has just completed a translation of it in three parts (New Haven), and his notes show the zeal and research of the student. The writings of Friedrichs are learned and acute, and of interest to all scholarly readers. His exegesis is not altogether exempt from the German tendency to fumble (we know of no better word for it) among the inner sensations and mental processes of the artists whose works are under discussion; nor from dogmatism, as when he says of Egyptian and Assyrian relief that "The object of putting heads and legs in profile was undoubtedly to prevent the projection of noses and feet beyond the surface." But it is very difficult to write a concise commentary without dogmatism, and the German *Innerlichkeit*, if it is sometimes amusing, does no harm; the learning and the discrimination are indisputably here. Translated for Americans, Mr. Eaton's three hundred pages or so of selections are in their present form a commentary without a text; for they are without illustrations, while there is not in our country a collection of casts which offers the range of examples that they cover. Being arranged, however, in the form of a handbook,

they lend themselves more to special reference than to continuous reading. For this use, and for the wants of readers in English to whom a German book of the scope of Overbeck's 'Geschichte der Griechischen Plastik' is impracticable, we know of nothing so good and so convenient. Now and then, especially in his third part, Mr. Eaton strays away pretty widely from Friedrichs, and supplements or replaces him by his own or other authorities, sometimes to advantage, and sometimes, we think, not to his readers' benefit, as, for instance, in his discussion of the Venus of Melos—or Milo. In a prefatory note, he says that he publishes his selections at first in numbers, in order to invite suggestions. We will therefore venture to offer one. It is that when these numbers are reprinted in book form, as we trust they may be, with illustrations, a translation of the introductory chapter on Greek sculpture in the volume (vol. ii.) which Friedrichs contributed to Schnaase's 'Geschichte der bildenden Künste,' should be prefixed to them. There could be no better introduction to the book—omitting, possibly, the first half-dozen pages—and it would be hard to find a better summarizing of the forms and qualities of Greek sculpture.

—Mention has already been made in these pages of the new series of biographies, called "Les Célébrités Contemporaines," to be published in Paris by M. Quantin (New York: F. W. Christern). The first half-dozen numbers have now appeared. The idea of the series is identical with that of the little yellow-covered collection of the writer who called himself "Eugène de Mirecourt," and who used his series of "Les Contemporains, portraits et silhouettes au XIX. siècle" as a means of abusing those of his fellow-Frenchmen whom he did not like, or with whom he disagreed either politically or theologically. But while Mirecourt's pamphlets were wholly untrustworthy, as he was equally unscrupulous in praise or in blame, the present series is to be written by writers of character having a reputation to lose, and treating each a congenial subject. The declaration is distinctly made that each biography will be the work of a friend—M. Zola, for instance, will have his portrait taken from life by his chief and ablest disciple, M. Guy de Maupassant. As we have already noted, the most of the literary biographies will be written by M. Jules Claretie. Two of these, M. Victor Hugo and M. Émile Augier, have already appeared. The sketch of M. Augier's honorable career and the characterization of his noble works are in M. Claretie's best manner. Here and there we detect fragments of criticism already printed in his 'Vie Moderne au Théâtre.' The little book on Victor Hugo, like nearly all contemporary French writing on this subject, is wholly uncritical. It is a pæan, a rhapsody of praise as colossal as its hero's vanity. M. Claretie records Hugo's *naïf* remark, that it is perhaps time for him (Hugo) "de désencombrer mon siècle!" Hugo is also set down as saying, "I was born at the right time for my glory: I am astride of two centuries!" Every little volume contains thirty-two octavo pages of text, a facsimile of MS., and an etched portrait of no striking artistic merit. It is a little odd that of the five biographies announced to be first published at the beginning of the year, Grévy, Hugo, Louis Blanc, Augier, and Gambetta, two have had to appear after the death of the subject.

—In Professor Karl Witte, the eminent jurist and Dante student, who died at Halle in the night of March 5–6, our century has lost its oldest celebrity, for Witte was famous eighty years ago, though then barely three years old. His father, a village pastor of considerable attainments, living at Lochau, near Halle, had proposed to himself to bestow upon his Karl, by a strict and systematic education calculated to develop his mental and bodily powers equally and harmoniously, the highest degree of culture of which *mens sana in corpore sano* was capable. The study of languages he considered the least injurious to an infant, and before the end of his first lustrum the boy was a linguistic prodigy, being familiar, among other tongues, with Hebrew and Greek. His acquirements were the results of methodical training rather than of natural—or unnatural—precocity. He made, subsequently, the same strides in the sciences, and in January, 1810, at the age of nine years and six months—he was born on July 1, 1800—he was duly matriculated a student of the Leipsic University. On the demand of King Jerome, of Westphalia, he was transferred to the University of Göttingen, and here he wrote, at the age of twelve, a mathematical treatise in Latin, on the conchoids of Nicomedes, which a year later procured him the title of doctor of philosophy. In 1814–16 he studied law in Heidelberg. Aided by the King of Prussia, he made a literary tour, and spent two years in the libraries and galleries of Italy, dividing his time between jurisprudence, art study, and Italian literature. He had not belied his juvenile fame, and his father deemed himself entitled to make known to the world the methods by which he had carried out his educational task, which he did in a work in two volumes, entitled 'Karl Witte der Jüngere, oder Erziehungs- und Bildungsgeschichte desselben' (1819). This book deservedly attracted general attention. The son shortly after became professor of law at the University of Breslau, and from 1834 till his death he officiated in the same capacity at Halle. He lectured and wrote on Roman, Byzantine, and Prussian law, but to Italian literature, and especially to the study of Dante, he devoted the best energies of his life, with an almost tender affection which manifested itself even on his death-bed. His editions and translations, with comments, of the works of the great Italian poet, rank among the foremost publications of the kind on either side of the Alps. Karl Witte ceased to be a prodigy when he began his professional career, but he preserved his health, his habits of diligent study, his mental vigor and serenity, and his standing as an author unimpaired to the close of his life. His last publication, the second part of his 'Dante-Forschungen,' appeared in 1879.

—Mme. Albani is, beyond question, one of the best *Sentas* to be found on the stage. Signor Galassi also is an admirable singer and a genuine artist, whose talent is not limited to the style of one country; while Signor Ravelli has often received just praise as an interpreter of Italian melodies. These three singers were in the cast of the "Flying Dutchman," which was given on March 21 for the first time in New York by Mr. Mapleson's company, although other companies have given it years ago. And yet the performance as a whole was very poor, and often abominable. We see here at once the difference between a German and an Italian opera. Given three good singers like those above-mentioned, together with an ordinary beer-house band and primitive chorus, and an Italian opera may yet be performed in such a way as to afford satisfaction, because it is merely a "concert in costume" for the soloists. But Wagner's operas are in the first place dramas, and unless every detail of action and scenery is brought into the most intimate relation with the music, the latter must necessarily miss its effect and appear aimless. There is not the slightest exaggeration in saying that Wagner, in writing his music, had in his mind's eye the gesture, action, and facial expression that are to accompany every single bar of the music. This is how he describes the first appearance on the stage of the *Dutchman*, in a special article which may be found in the fifth volume of his collected works (p. 208):

"While the trumpets sound their low notes (B minor) at the end of the introduction, he has stepped forward over a plank placed by the sailors between the ship and a rock on shore; the first note of the ritornelle of the aria (the low E sharp of the basses) is accompanied by the first step of the *Dutchman* on the land; his staggering gait, characteristic of seamen when they first come on shore after a long voyage, is again musically accompanied by the wavy movement of the 'cellos and violas; the first quarter of the third bar coincides with his first step, his arms being always folded and his countenance lowered; the third and fourth steps concur with the notes of the eighth and tenth bars."

It cannot be said that Signor Galassi followed all these minute details, but, in a general way, his conception of the part was correct and interesting, and no one could fail to admire his beautiful voice and the ease with which he covered the unusual intervals. What was lacking in his impersonation was that weird fascination and power which the best German vocalists manifest in this part, and for which, it must in justice be added, they are largely indebted to the dramatic excellence of their support. Mme. Albani's *Senta* was the naïve, healthy, northern maiden of Wagner's fancy, whose dreaminess never degenerates into sickly sentimentality. The most critical moment in her part is that when she is left alone face to face with the *Dutchman*. Here, as in other situations, Mme. Albani showed herself a gifted actress. Her only fault was a disposition to alter a cadence or displace a rest in order to secure a special effect of operatic vocalism. There was no great exaggeration in this, but it should have been avoided altogether. Signor Ravelli had the short semi-lyric rôle of *Erik*, and he conceived it entirely in an Italian spirit—that is to say, he spoiled it. "He will do me a poor service," says Wagner, "who sings the cavatina in the third act in a sweet style; it should rather breathe sadness and melancholy." Signor Ravelli also took a great many liberties with his notes, leaving out some and putting in others where it suited his fancy. His *Erik*, in a word, was as unsatisfactory as Campanini's *Lohengrin* always is. Of Signor Clodio's *Steersman* it need only be said that it was the strongest argument against compulsory pilotage ever advanced in this city. When we add to this that the chorus was only good in the second act, and made a terrible hodge-podge of the grand choruses of the other two acts, in so far as the conductor had not cut them out, it may be imagined that the total effect of the performance was painful to one who has heard this opera in Germany. The lyric second act was very well done, but the rest was vandalism, pure and simple. Instead of being dreary, as it seemed, the first act is really wonderfully fine, and full of the most characteristic music. But it is necessary to attend to a thousand details which were neglected at the Academy.

—Gounod's "Roméo et Juliette" is one of those operas which, like Weber's "Euryanthe" and some of Gluck's works, may confidently expect a much greater popularity in the future than they have ever had in the past. There is more good music and a thousand times more dramatic character in it than in a dozen works like "Lucia," "Favorita," and "Rigoletto"; and as the taste of our operatic audiences cannot fail to follow the same evolution as has been going on abroad, there is reason to believe that Gounod's work will figure very prominently on our operatic repertory during the next ten or twenty years. It was written in 1867, seventeen years after the appearance of "Lohengrin," and bears as distinct

evidence of the influence of that epoch-making opera as "Carmen," "Aïda," and countless lesser works. It may not contain as many popular melodies as "Faust," but its dramatic style is even superior to that of "Faust," and the score is so full of beautiful details that one could listen to the orchestra alone for a whole evening without feeling bored for a moment. It is to be hoped that Mme. Patti, whose *Juliet* is said to be among her best rôles, will add this opera to her repertory when she returns to New York next season. The performance by Mr. Grau's Opêra Comique Company at the Casino on Monday unfortunately was not such as to win over many new friends to Gounod's cause, except among those who are experts at reading between the lines. "Romeo and Juliet" of course requires a first-class orchestra, in the first place, and not a small operetta band which is out of tune half the time, and showers down wrong notes as a storm does hailstones. The next requisite is a good chorus. The one actually employed was very inadequate to its task, except in the great duel scene, where it was surprisingly good. The smaller characters were all admirably acted and indifferently sung, as was to be expected in a French company. Mlle. Derivis presented an interesting *Juliet* to the eye. Her acting might be studied to advantage by some *Juliets* on the dramatic stage, and her singing would have been acceptable if her voice had not been usually a quarter of a tone above the pitch, for it is otherwise of good quality. M. Capoul acted with his well-known dash and fire in the duelling scene, which he rendered quite exciting; but his love-making scenes were spoiled by his over-sentimental attitudes and his constant transitions from fortissimo chest-notes to pianissimo falsetto notes.

ENGLISH POPULAR BALLADS.

The English and Scottish Popular Ballads. Edited by Francis James Child. Part 1. Boston: Houghton, Mifflin & Co.

ALL lovers of our ballad literature are familiar with the collection of English and Scottish ballads which came out in 1857–8 under the editorship of Prof. Child. In the eight volumes which made up that work were first brought together, from widely scattered sources, the most famous pieces of the kind existing in our tongue. Nor was it the only distinguishing excellence of the collection that it was fuller than others: it had the special peculiarity that the poems included in it were given in the most authentic form then attainable. Genuineness of text was an object, indeed, that lay near to the heart of the editor. The impossibility of securing it in the condition of things then existing was a source of constant regret, and justified an occasional lapse into wrath. There is a suggestive note to the preface, in which the editor gave vent to his latent indignation by asserting that in retaining certain pieces from Buchan's collection which he believed to have been tampered with, he had been under the necessity of exercising a good deal of resolution, and suppressing a great deal of disgust. For, as a matter of fact, a genuine text was in most cases not then attainable. All previous editors had been possessed with the devil of emendation and so-called improvement. Alterations made by them could be suspected, but without the sight of the original manuscript they could not be proved. Still less could the early authentic form be ascertained; for the original manuscripts had passed in most cases out of sight, and in some cases out of existence.

Twenty-five years have gone by since the collection spoken of was published, and we now see the first instalment of a work which will do for the ballads of our tongue an office too long postponed. The delay was inevitable, but none the less has it been unfortunate, for much has doubtless perished which years ago could have been recovered and permanently preserved. The schoolmaster is abroad, and the goodness of the work he has done need not be denied; but it is one of the indirect results of his omnipresent activity that the ballads of English speech, like the words of English dialects, have passed away for ever, or are in process of passing away. The songs of the people are no longer handed down from generation to generation by word of mouth. The old women who once made the hair of children stand on end with stories of desperate doing and daring have found their vocation gone, and have ceased to remember what no one cares to hear. "The spinsters and the knitters in the sun" chant no more what England's great dramatist characterized as the plain and antique songs that dally with the innocence of love. The mind of the boy is now rarely thrilled, as in the old age, with tales of heroic achievement which, even in maturer years, Sidney confessed stirred his heart more than the blast of a trumpet. We have changed all this: our children need no longer resort to the rude devices of unlearned times. Besides the annual overflowing Christmas supply of literary milk-and-water, they have now plenty of monthly and weekly publications specially devoted to their intellectual nutriment, and it is merely a question of time when a daily paper will be printed solely for their use. Fortunately, they have already learned to take on the habits of their elders, and are saved from the worst effects of reading the things they do, by not remembering anything they read.

The necessity of preserving these ballads, not as they have been printed, but as they were written—or at any rate handed down by oral tradition—has therefore been long a pressing one; but the work could not be done, because there were no means of ascertaining the form they originally had. The Percy folio, the most important collection of all, had been for a long time in hands which denied even the sight of it to the most eminent English scholars. For any apparent benefit resulting from its existence, it might as well have been returned to its place under the bureau in Humphrey Pitt's parlor, whence, dirty, tattered, and used by the maids for kindling the fire, it had been rescued by the youthful antiquary. But well-directed, energetic, and persistent importunity, coupled with the use of money, at last rescued this literary treasure from any further chance of destruction. In 1867–8 it was brought out in four volumes, edited with most scrupulous fidelity and intelligence by Mr. Hales and Mr. Furnivall. The text was then for the first time printed in all its original purity—or impurity, if one so chooses to consider it.

The publication of this book enabled all students to know at once, and positively, what was the genuine ballad, and what was the article that had been masquerading in its guise. As an illustration of Percy's method of dealing with his material, two examples will suffice. The story of "The Child of Ell" is a form of one of the most widely-spread tales of northern Europe. As it existed in the manuscript, it was a fragment of thirty-nine lines. These Percy took as the basis to form a complete ballad of his own, which appeared in the Reliques as a poem of some two hundred lines; and even in this, very few of the original thirty-nine appeared in their authentic form. In a similar way, he polished "The Heir of Lin," and did his work so thoroughly that, according to the editors of the folio, "he could see his own face in it." In this case, also, the one hundred and twenty-five lines of the manuscript came out two hundred and sixteen under his multiplying hand; and, as usual, there was little or nothing to indicate certainly what was ancient and what was modern. These are, to be sure, among the extreme instances; but they make clear the light in which ballads were regarded, and show the spirit that presided over this attempt to bring them before the public. Percy, indeed, can be pardoned for failing to print but one-fourth of the matter contained in the manuscript, for he printed the best; but he cannot well escape blame for the unwarrantable liberties he took with the text. To borrow a phrase which the speculative transactions of our time have made too familiar, he was constantly engaged in watering his stock; and he had as little conscience in the operation as any modern railway director. The result was that the diluted expression and mawkish sentiment which were added to the directness and rude vigor of the original, made often a mixture which the modern editors very appropriately call "a flood of ballad-and-water," from the most copious draughts of which little intellectual sustenance or poetical inspiration can be derived.

One can easily, however, be too hard on Percy, and that, moreover, most unfairly. It was a venturesome undertaking—and he fully felt it to be so—for any man in that age of paint and periwigs and powder to treat as worthy of print "these old things," as in one place Percy deprecatingly termed them. His preface was almost painful in its apologetic tone. These ballads, he said, were written merely for the people, and he recognized the fact that great allowances would have to be made for them by the men of the polished generation he was addressing. He did not disguise his apprehension that in the highly improved state to which literature had then attained, the artless graces and pleasing simplicity of these productions would not be deemed worthy of the attention of the public. He doubtless felt that he had, and perhaps he actually had, to dress them up, in order that they should be received at all: and if he did sometimes dress them up so that they would hardly have known themselves, let us not forget the polite society in which it was his lot to introduce them. Even in the new attire, sometimes gorgeous and sometimes sentimental, in which they appeared, it was hard to get any recognition for them from the arbiters of the reigning taste. It was, perhaps, partly due to a vague feeling of prudence on their part; for these ballads, even in the "improved" condition in which they saw the light, were to be one of the main agencies in overthrowing the principles of the literary dynasty that then held supreme power. Much unfairness is often shown to the eighteenth century by men who, not simply content with abandoning the poetical faith it cherished, feel it incumbent to revile unqualifiedly its poetical achievement. But it is doing it no injustice to say that naturalness and unconsciousness are not the qualities that specially mark its literary character. These, however, are the very qualities which most distinguish the genuine ballad. It may be uncouth, but it is always simple and spontaneous, and therefore strong. It goes straight to its mark. It is written under the pressure of absorbing emotion, in which the poet surrenders himself to his inspiration, and is not consciously practising his art. It is the more effective because it is not aiming at effect. The ballad-writer, in fact, produced his verse as Porson said that Fox produced his sentence: he threw himself into the middle of it, and left it to God Almighty to get him out again. No one needs to be told that it is not in this way the poetry of the eighteenth century was usually written.

Considerations like these show of what essential importance it is that the ancient ballads of our tongue should be secured and preserved in the earliest and most authentic form attainable. In one respect the delay has been fortunate, for the work has fallen into hands the most capable in the long line of editors of doing it with the most absolute accuracy and completeness that are now within reach. It is no secret to students of our ballad literature that, ever since the publication of the Percy folio at least, Prof. Child has had this undertaking in mind. It is doing the simplest act of justice to say that in his qualifications for this self-imposed and most laborious service to literature he finds no superiors among the living or the dead; nor would it probably be doing any injustice to any belonging to either of these two classes to say, further, that he finds no equal. His zeal and industry have, moreover, brought to light treasures that but for him would probably have perished. When the Percy folio had been secured and printed, there still remained several other manuscript collections which had been used by previous editors. These belonged mainly to the north of Britain. Scotland can justly be proud of her ballad poetry, and, in the consideration of its quantity and excellence, one can feel pity rather than express reproach for the patriotism, equally profane and inane, that ventures to compare Barbour with Chaucer. It is gratifying to learn, as we do from the advertisement, that several of the manuscript collections of these ballads, as well as versions of individual ones, have been secured. The generous help of many is amply acknowledged, but it needs no special insight to see that the success in procuring unused material has been due mainly to the indefatigable exertions of the editor, and to the enthusiasm which his own enthusiasm has communicated to all who were interested in this kind of literature.

Of the execution of the work, so far as it has already been done, it is scarcely possible to speak in terms of too high praise. The present part is but a slight instalment of the whole. It consists, in fact, of but twenty-eight ballads; yet these, with their illustrative comparison of the story, and with their variations of version, take up more than two hundred and fifty double-columned pages. The amount of study put upon the work, the amount of investigation displayed in it, are, indeed, such as to appall veteran scholars who have been wont to attack the most formidable literary strongholds. When completed on the scale on which it has been begun, we feel justified in saying that it will be the most important contribution that American scholarship has yet made to any subject concerned primarily with literature.

It hardly needs to be added that a work of this kind is not intended for the ordinary reader, even if he be a man of letters. It is, in truth, a storehouse to which the student of language, the student of poetry, the student of fiction, and the student of folk-lore must resort for information of a special kind, which can be found collected in its pages, and, so far at least as our own language is concerned, in its pages alone. Its value will therefore increase rather than diminish with time; yet even now he who reads mainly for amusement will not fail to find much in it to entertain and instruct a man of literary taste. It remains to add that the work is published by subscription, and that the publishers have done their part in making its external appearance as attractive as the internal is valuable. It will not be to the credit of the American people if a collection like this—the fruit of earnest and unselfish devotion to literature for its own sake—does not meet with adequate appreciation and encouragement.

McMASTER'S HISTORY OF THE AMERICAN PEOPLE.

A History of the People of the United States, from the Revolution to the Civil War. By John Bach McMaster. In 5 vols. Vol. I. D. Appleton & Co. 1883.

The striking passage in which Macaulay refers the differences in the historical methods of Herodotus and Thucydides to the change in the characteristics of their countrymen, was evidently written not alone for Greece or for Great Britain, but for America as well. Here, also, the stage has been passed in which feeling is of supreme moment in the narration of history, in which we transfer to former times all the characteristics of our own, and, consciously or unconsciously, attribute our own prejudices to men who were as foreign to them as Brahmin is to Parisian. Here, too, we "aspire to know, where our ancestors were content to doubt, and begin to doubt, where our ancestors thought it their duty to believe." The attitude of the reader has changed; so far as he can get, he most desires full and exact statement, accurate definition, and a faithful projection of the real actors in the story, without any disguise of their elements of weakness as well as of strength. The consequence has been that the basis of historical narration has changed very considerably within the memory of men now living. The historian's business is no longer mainly with kings and presidents, with the negotiation of treaties and the planning and fighting of campaigns, with the discussions of the senate and the comparative merits of rival statesmen. These are but the bubbles on the surface of the mighty river—the people—that underlies them and governs their course. To this the historian must give its due proportion. He must not be satisfied until he has made the people of the past as definite and clear to view as the people of the present, until the reader has as exact a notion of what action or feeling would have been natural or unnatural to the men of the past as he has in the case of the men of the present. The great events of history will not then come to the reader "like supernatural inflictions, without reason or cause." History will then take on a complete and natural symmetry, and the historian, like an inspired census-taker, will hold up a mirror which reflects the portraiture of the times, not of himself.

If this is to be the scope of history, the volume under consideration is the beginning of that which bids fair to be the authoritative history of the United States for the period which it covers. It is such a book as John Richard Green would have written if he had been able to devote an entire volume to the history of seven years. It is the history of the people of the United States, thrown upon a larger canvas than Green could afford to use, and, therefore, making visible more minute lines than can be found even in the 'History of the English People.' It is a storehouse of facts concerning the life, feelings, and limitations of the people, attractively grouped, and stated with precision and masculine energy. There may be, probably will be, lacking in subsequent volumes something of that wonderful grasp of the nation's environment, of the influence of other nations upon it, and of it upon other nations, which gives Green's work its unique position in its own school. But this lack would hardly be noticeable in the history of a people like that of the United States, whose life has as yet been comparatively self-contained, and is but just growing into its full influence upon the life of the world. Prof. McMaster's work, so far as it has gone, deals with a time when nobody read an American book, and the American people was living its own isolated life. It is, therefore, fair to ask only how far it has followed those modern canons of historical criticism which are applicable to the history of a people so situated.

The first hundred pages of the volume are given to a very full and successful delineation of the American as he was in 1784. If any fault could be found with the details, it would be that they deal perhaps too closely with the New-Englander at the expense of the Southerner, the people of the Middle States receiving about a fair share of attention. It may very well be that the author's intention is to leave the more exhaustive treatment of the Southern social system until it has taken permanent shape, after 1793. With this exception, hardly any fault can be found with this part of the work, which is not at all confined to the first hundred pages, but continues at intervals throughout the volume. The average American's poverty of books, his difficulties of travel, his isolation from all the outside influences which so powerfully affect his descendants, are all stated minutely and clearly, and cannot fail to awaken the reader's attention to the strangeness of the country he is entering. Constant comparisons between past and present enforce the contrast. The history is that of a time when fewer letters were distributed in all the thirteen States in a whole year than are now distributed at New York city every twenty-four hours; when newspapers were not admitted to the mails, and were only carried for a special fee by the post-riders; when postmasters and post-riders habitually opened and read the letters in the mails at their pleasure; when every political leader was compelled to write in cipher; and when the output of the whole periodical press of the country did not equal in amount that of a single modern daily newspaper. And the quality of the newspaper of the time was very much on a par with the quantity:

"The student of history who seeks in the *Packets* and *Advertisers* of that day for information on matters which it concerns him to know, will in all likelihood search long and find but little. He will read much about the sin of idleness, about the value of economy, about the wretchedness of the wicked woman whose feet take hold on hell; but he will meet with nothing, or next to nothing, on many of the most exciting topics and important events of the time. He will, for instance, look in vain for any extensive information on the abhorrence which the people felt for the Cincinnati, on the proceedings of the Middletown Convention, on the action against the Mayor's Court for its decision in the case of Rutgers against Waddington, on the formation of the State of Franklin, or the rupture of the Committee of the States, whereby the country was left without a government for many weeks. These were matters concerning which an editor two hundred miles away had no direct means of knowing. He had not in every city and town a well-paid correspondent whose duty it was to collect the freshest bits of scandal, to interview the latest public character, and to send accounts of the course of public opinion. For all this he was indebted to a source now rarely, if ever, used even in a backwoods village or a prairie town. Any gentleman who was so fortunate as to receive a letter from a distant part of the country was expected to display his public spirit by sending to the printer such portions of it as were likely to be of interest to the community. Scarce a week, therefore, went by but the *Gazettes* contained many scraps of valuable information under such headings as 'A Letter from a Gentleman at the Falls of the Ohio to his Friend in New England,' 'A Letter from a Gentleman resident in Virginia to his Friend in this City.' Sometimes these communications would fill a column, and almost always they were well worth a careful perusal."

The faithfulness of this and other descriptions will be recognized by those who have had occasion to recur to such original sources. But the mass of readers have had no such occasion. To them the things and events of the past are unconsciously associated with those of the present,

and the man of 1784, who had fought out the war of the Revolution, who framed the Confederation and the Constitution, is much the same personage, albeit with a singular taste in dress, as the man of 1883, who telephones from New York city to Cleveland, telegraphs around the world, crosses the continent in a week, and pays a national debt of three thousand millions in a generation. For any such unconscious cerebration there will no longer be any excuse, if this work is carried out in the manner in which it has been begun. At every step the reader is guarded against any danger of confounding the country of the present with the country of the past. He is cautioned that if he could look upon the country as it was in 1784 he would not recognize it:

"The hamlets of a few fishermen would mark the sites of wealthy havens now bristling with innumerable masts, and the great cities themselves would dwindle to dimensions scarce exceeding those of some rude settlement far to the west of the Colorado River. Of the inventions and discoveries which abridge distance, which annihilate time, which extend commerce, which aid agriculture, which save labor, which transmit speech, which turn the darkness of the night into the brilliancy of the day, which alleviate pain, which destroy disease, which lighten even the infirmities of age, not one existed. Fulton was still a portrait-painter, Fitch and Rumsey had not yet begun to study the steam-engine, Whitney had not yet gone up to college, Howe and Morse, McCormick and Fairbanks, Goodyear and Colt, Dr. Morton and Dr. Bell were yet to be born. A narrow line of towns and hamlets extended, with many breaks, along the coast from the province of Maine to Georgia, but fifty miles back from the waters of the Atlantic the country was an unbroken jungle."

The sparseness of population, and the lack of facilities for the interchange of intelligence, were aggravated by the difficulties of travel:

"While Washington was serving his first term, two stages and twelve horses sufficed to carry all the travellers and goods passing between New York and Boston, then the two great commercial centres of the country. The conveyances were old and shackling, the harness made mostly of rope; the beasts were ill-fed, and worn to skeletons. The ordinary day's journey was forty miles in summer; but in winter, when the roads were bad and the darkness came on early in the afternoon, rarely more than twenty-five. . . . Even a trip from Brooklyn to New York, across a river scarce half as wide as that separating the city from New Jersey, was attended with risks and delays that would now be thought intolerable. Then, and indeed till the day, thirty years later, when the rude steamboats of Fulton made their appearance on the ferry, the only means of transportation for man and beast were clumsy row-boats, flat-bottomed, square-ended scows with sprit-sails, and two-masted boats called periaguas. Every week small herds of steers and flocks of sheep were driven to the ferry, shut up in pens, and brought over the river, a few at a time, on the scows. The calmest days, the smoothest water, and a slack tide were, if possible, chosen for such trips. Yet even then, whoever went upon a cattle-boat took his life in his hands. If a sudden gust of wind struck the sails, or if one of the half-dozen bullocks became restless, the scow was sure to upset."

The political history of the years covered by the first volume is full, minute, and accurate. There is no attempt to disguise the fact that the success of Dr. Cutler's Ohio Company, and the passage of the Ordinance of 1787, were intimately associated with a gigantic land-jobbing scheme, in which all the influential members of Congress were "let in on the ground floor." There is no attempt to disguise other similar features of contemporary politics, which, if they should occur now, would brighten the faces and lighten the labors of the Washington correspondents, and supply a battery from which to shock the country with the revelation of official scandals. The details of social life, too, are given with painstaking completeness. The misery of the poor man's life; the horrors which armed his ever-watchful enemy, the law of imprisonment for debt; the formal courtesies of the higher classes, their amusements, relaxations, and business methods; the wilder life of the State of Franklin and the county of Kentucky—all these are so fully covered that the scrutiny which could suggest missing details would be severe indeed.

But, after all, however interesting these may be and however spirited the manner of their narration and grouping, the great and crowning excellence of Mr. McMaster's work is its faithfulness in picturing the enormous difficulties of national action in 1784 and the succeeding quarter of a century. If the work is completed as it has been begun, its reader will never be assailed by the insidious temptation to clothe the characters of which he is reading with the attributes of the present, to transfer to the American of 1784 the characteristics and advantages of the American of the present. He will feel no surprise at occasional suggestions of secession in various parts of the country, for he will have been already completely acquainted with the social and political limitations of which they were the fruit; nor will he remember them as an excuse for later suggestions of secession, when the original limitations had disappeared. To him the history of the United States will not seem a succession of inexplicable cataclysms provoked by the bad temper or folly, the wisdom or good luck, of the people of one section or the other, but an orderly succession of natural events, the inevitable effects of moving causes which have already taken their places in his memory and judgment. For these reasons, this first volume is a most encouraging promise of the standard history of the people of the United States.

A single criticism, if it be a criticism, might be made upon the promise that the work is to be completed in five volumes. If it has taken one volume to cover the years 1784–90, it is difficult to see how the remaining seventy years, down to "the beginning of the Civil War," are to be covered, after the same method, in four volumes. The work ought not to be written for the reader of 1883 or 1890 alone, and, if it is to be of permanent value, it must cover the expanding social conditions of 1830–60 as fully as it has done those of 1784–90. But any such criticism would be premature, and the increasing homogeneity of modern society will probably obviate it.

THE IMPERIAL DICTIONARY.

Imperial Dictionary of the English Language. By John Ogilvie, LL.D. New edition, edited by Charles Annandale, M.A. Illustrated. 4 vols. London: Blackie & Son; New York: The Century Co.

THIS work, of which we have here what might be called either the second or third edition, has been for thirty-six years in vogue on the other side of the water. First published in 1847–50, it was distinctly the offspring of Webster's Dictionary, of which it became the parent when it introduced the practice of inserting illustrations in the text—a most legitimate mode of definition. To adopt the reckoning of the title-page, the present edition contains 3,000 woodcuts, or, as exactly as possible, an average of one for every page. The length of the printed page is nearly the same as that of Webster, the width less by one and a half inches, so that each of the three columns is considerably narrower than in the American work. The type is substantially the same, but that of the catchwords is rather more distinct in the 'Imperial Dictionary,' to which on the whole we should give the palm for convenience to the hand as well as to the eye of the searcher. The binding, of a blue-black cloth, is simple and tasteful. The four volumes have the compensation of lightness when consulted individually, but add to their obvious disadvantage that of being divided in the midst of a letter (though not of an article). The third volume, however, begins with L, as the first volume with A.

The prime cause of the bulkiness of this work is that it encroaches upon the cyclopædia. This has been the tendency even in our American dictionaries: consult the definition of *morris* as given by Webster. The 'Imperial Dictionary' purposely expands some of its definitions so as to include details commonly reserved for technical or historical works. Compare *bile*, *blow-pipe*, *chauvin*, *heliotype*, etc. Under *steelyard*, the principle of this balance is set forth; under *steam-engine* and *steam-whistle*, the accompanying diagrams are explained by references to the lettering; under *perfectionist*, we read, truly, "The founder of the sect was John Humphrey Noyes, and the principal community is established on a farm at Oneida Creek, in the State of New York. The followers of Noyes call themselves also *Bible Communists*," and much more, both historical and doctrinal. A second source of great fulness is in the illustrative quotations from standard authors. There are more in all than in Webster, and where the latter gives only the significant part of a verse of Shakspere or Milton, for example, the 'Imperial Dictionary' often rounds out the couplet or stanza—compare *deck* (of cards). The editors have also had the good thought to introduce as many "familiar quotations" as practicable. Finally, their use of American writers has been very liberal. The third begetter of length is the vocabulary, and here the editors have not only profited by the most recent supplements to Worcester and Webster, but have incorporated Scotch words to an extent that should disturb the rest of Dr. Johnson. They have, finally, added a supplement of their own to the last volume, in which we find such neologisms as *bell-punch*, *boycott*, *circumnutation* (Darwin), *closure*, *ego-altruistic* (Spencer), *ensilage*, and many more not given by Webster, together with a much greater number common to the two works. Proper names like *Asura*, *Accad*, *Benthamism*, *Danite*, etc., abound in both, but on no clear principle of selection, and have a questionable title to be included, apart from their undoubted convenience. Americanisms, like *greenback*, *hoodlum*, *interview*, *lacrosse*, *phenomenal*, *record* (political), *repeater*, *ticket*, *underground-railroad*, etc., are well represented. *Boss*, in its political sense, is not recognized. The nice point in the metaphor which gave birth to *carpet-bagger* is quite missed in the statement—"because regarded as having no more property than might fill a carpet-bag"—and the subsequent definition—"a needy political adventurer who goes about the country," etc. Worcester's definition is much better. The carpet-bagger was one who had only a transient interest in the country he infested—a sojourner, who meant to stay only till he had filled his pockets with the spoils of politics. His opposite was the bona-fide settler.

The etymologies may be trusted as among the best now accessible. They have had the advantage of Skeat's Dictionary (compare *bludgeon*, *whitlow*), but they do not slavishly follow that author's conclusions (compare *havoc*, *hurlyburly*, *mate*, *picnic*). The synonyms are, perhaps, not superior to Webster's. The definitions are of unequal merit, and in one department, for which preëminence is claimed in the prospectus, so deficient that we think proper to dwell on them, in order that the editors of the new dictionary projected by the Century Co., and based on the 'Imperial,' may take warning in time. We

refer to zoölogical terms, of which we must give a few examples:

"*Agouta* (a-gō'ta), *n.* [Native name.] An insectivorous mammal peculiar to Hayti, of the family Talpidæ, and the sole member of the genus Solenodon. It is so puzzling to naturalists that it has received the name of *S. paradoxus*. It has the fur, ears, and tail of the opossum, but the teeth and elongated nose of the shrews. . . . It is of the size of a rat, and not unlike one."

The agouta does not belong to "the family Talpidæ," but to another widely distinct one; it is not the "sole member of the genus Solenodon," but has a congener in Cuba much better known; it is no longer "puzzling to naturalists," but for twoscore years its relationships have been understood and generally admitted; it has not "the fur, ears, and tail of the opossum," but its own—that is, those parts are characteristic; the teeth, far from being those "of the shrews," are so different as to have compelled recent naturalists to place it in a different *primary* division of the order; its elongated snout is better simulated by other insectivores than the shrews; and the final remark not only is untrue, but contradicts the previous ones.

"*Agouti* (a-gō'ti), *n.* The Indian name of several species of rodent mammals, family Caviidæ, genus Dasyprocta or Chloromys. The common agouti, or yellow-rumped cavy (*D. Agouti*), is of the size of a rabbit. The upper part of the body is brownish, with a mixture of red and black; the belly yellowish. Three varieties are mentioned, all peculiar to South America and the West Indies," etc.

The etymological statement is not only indefinite, but actually wrong; the agouti does not belong to the family Caviidæ (not Cavidæ), but to a peculiar one (Dasyproctidæ); Chloromys is an obsolete synonym, and not a true alternative name, as might be supposed; *ten species* of agoutis are now recognized, and not "three varieties" (in a dictionary wherein definitions are the principal feature, such loose interchange of words as "species" and "varieties" is a grave fault); agoutis range northwards into Mexico, and are consequently not "peculiar to South America and the West Indies."

"*Ape* (āp), *n.* [A. Sax. *apa*; the word is widely spread; comp. Icel. *api*, D. *aap*, Dan. *abe*, G. *affe*, O. H. G. *affo*, Ir. and Gael *apa*, W. *epa*, O. Bohem. *op*, Mod. Bohem. *opec*, an ape; an initial guttural has been lost in all these words seen in Gr. *kēpos*, Skr. *kapi*, an ape.] One of a family (Simiadæ) of quadrumanous animals found in the torrid zone of both continents, including a great variety of species. The word ape, as well as the terms monkey and baboon, were formerly applied indiscriminately to all quadrumanous mammals; but it is now limited to such as have the teeth of the same number and form as in man, and which possess neither tails nor cheek-pouches. The family includes the chimpanzee, gibbon, gorilla, orang-outang, Barbary ape, &c., and has been divided into three genera, Troglodytes, Simia, and Hylobates," etc.

The first sentence is badly constructed, and its meaning ambiguous; the termination "adæ" is a defiance of etymology not tolerable in a dictionary of etymologies; the statement that Simiidæ are found in "both continents" is at least misleading: the family is represented in two continents—Africa and Asia—but not in both the Old and New World, as might be supposed by many from the words used; the family cannot be properly said to "include a great variety of species"—compared to others it has but few. The word ape has been used in several ways: (*a*) our Aryan as well as less remote ancestors apparently used the cognate term for a cercopithecoid monkey; (*b*) it has been also employed with the extended sense indicated above; and finally (*c*), it has been misapplied to forms unknown to the "ancients," and is now much used as the English synonym of the family name Simiidæ—that is, for the large tailless quadrumana. The family does not include the Barbary ape—that species is a true monkey.

"*Camelidæ* (ka-mel'i-dē), *n. pl.* A family of quadrupeds, including the true camels of the eastern hemisphere, and the llamas of the western. They are the only ruminants with canine and incisor teeth in the upper jaw."

The Camelidæ are by no means "the only ruminants with canine and incisor teeth in the upper jaw." Very many others have upper canine teeth, and some have *very large* and tusk-like ones—such are the water-deer, the musk-deer, and the Tragulids—while many extinct forms of ruminants had a full complement of *both* "canine and incisor teeth in the upper jaw."

Another fault is the constant use of anatomy ("*anat.*") for anthropotomy. For example, the "anat." terms, *anus* and *aorta*, have definitions and descriptions applicable to the manifestation of the parts in man, but not to their development in other animals. Occasionally we miss the zoölogical application of terms employed in many senses. Thus, *boot*, in addition to the meanings given, is used to denote the continuous front sheath of the tarsus of most oscine or singing birds, like the robin: *booted* is a correlated adjective.

There remains one defect for which the 'Imperial Dictionary' is not conspicuous, but which characterizes all in a greater or less degree. We can best express it by saying that the editorial point of view is too exclusively that of one to whom the language is vernacular. This is shown particularly in the want of pains taken to indicate the prepositions of relationship, as *to* and *with* after *comparison*, *to* and *from* after *averse* or *different*, *upon* after *dependent*, *of* and *upon* after *independence*, and the like—words in the choice of which the native often hesitates. This principle might be greatly extended so as to show words usually found in conjunction. For example, what verb shall be used with *autopsy*—to *have*, *hold*, *make*, or *perform*? We put the question as a foreigner might. If the new editors bear this in mind, and scrutinize every word in the light of its relationships, giving copious illustrative examples, we believe they will do more to make the 'Century Dictionary' preëminent than in any other way. In the meantime the 'Imperial Dictionary' is a very valuable addition to our books of reference.

WALKER'S POLITICAL ECONOMY.

Political Economy. [American Science Series.] By Francis A. Walker. Henry Holt & Co.

General Walker departs widely from the traditional methods of elementary books on political economy. His view is that the principles of pure or *à priori* political economy should indeed be traced out and systematized, but less as an end of study for their own sake than to serve as a framework or skeleton on which to impose "the flesh and blood of an actual, vital political economy, which takes account of men and societies as they are, with all their sympathies, apathies, and antipathies." His wide reading and familiarity with industrial affairs supplied him with ample materials for the task of dealing with the subject in this spirit. His book abounds with fact and illustration taken from daily life. It discusses current questions with fearless vigor. Whatever may be thought of General Walker's conclusions, we apprehend that no one who reads his book will be likely to find it lacking in vitality.

That there was need of a fresh statement of the principles of political economy, most students and teachers of the subject are painfully aware. Whether they will accept General Walker's book as suitable and satisfactory for their purposes, we shall not venture to predict. The orthodox school will undoubtedly find much in it to criticise. They will be likely to say that the author does not make the fundamental principles sufficiently prominent, and does not explain with sufficient fulness their play one upon another. They will probably reject the notion of a changeable or "final" utility, and also that conception of wealth which finds in improvements in production a tendency to diminish wealth. They will be likely to say that Mr. Walker gives undue prominence to demand and supply in his law of value, and ascribes far too little importance to cost of production. They will pretty certainly reject his theory of wages and profits. His apparent leaning to the heresy of the bimetallists will not be likely to conciliate their good opinion. And yet, even where they dissent entirely from the doctrine, they will probably find much in his book to stimulate thought and reflection.

The portions of his book on which General Walker would, we suppose, lay most stress, are those portions in which he develops his theory of wages. He rejects with emphasis the so-called wage-fund theory, and all theories which make wages the outcome of any ratio or relation between the amount of capital and the number of laborers. His own view is that production, not capital, is the measure of wages; that every act of productive labor is, in fact, rewarded out of its own product. Rent and the rewards of capital are determinate, being regulated by definite laws; under free competition they cannot exceed their normal amount. Wages alone are indeterminate. They are the residue of production left after paying the fixed charges; they vary, therefore, and vary at once, with every change in the productiveness of industry.

As against some statements of the wage-fund theory, it may be admitted that Mr. Walker has a case. That theory has undoubtedly been stated by some with too much rigidity and narrowness, as if it recognized nothing beyond a purely arithmetical process in the determination of wages. So stated, the theory is easily assailed. Yet we cannot but believe that the wage-fund theory, properly stated, rests on a sure foundation of industrial fact and sound reason; and that General Walker's contribution toward a better understanding of the law of wages, will turn out in the end to be whatever involuntary help he may have given toward a better statement of that theory. So far as may be done in a brief article, we wish to indicate the grounds of this belief.

The wage-fund theory starts with a few simple assumptions which we think no man will controvert. It assumes: (1) that there is in existence a body of wealth, known as circulating capital, which has been saved from past production, and is designed by the owners of it for use in gaining more wealth; (2) that nothing but fresh savings can increase this capital; (3) that high profits stimulate and low profits discourage fresh savings; (4) that the possessors of circulating capital will wish to keep it always employed in making gain.

Now, there is only one way in which circulating capital can be employed so as to make gain. Except to advance wages to laborers and rent to landlords, there is absolutely no room for it in the industrial system. If laborers and landlords always waited for their pay until the consumers of their commodities paid for them, there would be simply no function for circulating capital. The laborers would then, beyond question, be paid for every act of labor in the product of the labor itself, or rather its value; production would then in truth be the measure of wages. In that case, except the landlords

and owners of fixed capital, none but actual laborers would have any claim upon the products of industry. Wages would therefore be higher than at present—higher by the whole amount that now constitutes the gains of circulating capital. True, the gain would be accompanied by great risks for the individual laborer: a fall in the value of his product before it reached the consumer might lower very much, or even destroy entirely, the returns for his labor.

The mere existence of circulating capital is proof positive that laborers do not in fact wait for their rewards until the consumer pays for their products. The question here is one of fact—not what might be, nor what ought to be, but what is. Circulating capital exists, it pervades all industry, and everywhere, under proper management, it brings gain to its possessors. General Walker points to the fact that laborers were formerly hired by the year in this country, and were not paid in full till the end of the year; also to the fact that farm laborers quite commonly wait for their wages till the crop is harvested, or even sold. So far as this implies a real waiting for wages, and not a mere substitution of advances to laborers out of the circulating capital of the butcher, the grocer, and the dry-goods merchant for advances by their actual employers, the fact could not fail to have an important influence on the rate of their wages. We admit freely that all such real waiting has its reward; it leaves less for circulating capital to do. But against the wage-fund theory it proves nothing. Unless laborers wait for their pay until the consumer pays for their products, their pay must come out of capital. There is a vast mass of farm produce in store on both sides of the Atlantic at the present moment. General Walker will scarcely contend that the laborers who produced it are still waiting for their pay. The mere transfer of the supply from one capitalist to another proves nothing. Whence, then, came the wages paid to those laborers? Whence, further, came the wages paid to laborers for producing all the other commodities that are now in warehouses and on the shelves of the dealers all over the country? It is futile to answer that these commodities themselves have been paid to laborers, or that laborers have been paid out of them; for here are the commodities to refute the assertion. Their wages, then, must have come from the saved products of previous labor—in other words, from circulating capital.

Now, the wage-fund theory assumes that the wages so paid to laborers in any given period cannot exceed the total amount available for the purpose. Further, it assumes that, in the ordinary course of things, the whole amount so available is in fact paid to laborers, since that is the only way in which any part of it can be used so as to make gain. But now we must notice a point which has been too frequently overlooked. Circulating capital, as its name implies, is wealth in motion. Much the larger part of it consists of commodities at one stage or another of their long progress from their first condition of crude nature to their final reception as finished products by the consumers. The other part consists of money received from consumers, and is, so to say, on its way back to the labor end of the double chain, to be there converted into commodities again through the agency of labor. There is thus a double movement going on in the circulating capital; it is the result of division of labor and exchange of commodities. Now, obviously, the effect on wages of a given mass of circulating capital will depend not simply on its amount, but also on the rapidity of its circulation. A capital of $1,000 paid out for labor and recovered again from the consumer twice in a year, will act as powerfully on wages as double the amount paid out and recovered only once in a year. Any circumstance, then, that affects the rapidity of circulation of the whole mass of circulating capital cannot be without an effect on wages. Anything that quickens the conversion of commodities into money at the consumer's end, will increase the amount of circulating capital in the form of money that awaits conversion into commodities at the labor end. This increase of money-capital will constitute an increased demand for labor, and wages will tend to rise. Similarly, any obstruction to trade, any increased difficulty in the sale of goods to consumers, will check the rapidity of circulation and tend to depress wages. A law of wages which overlooks this essential quality of circulating capital is no better than a law of prices which should fail to take account of the rapidity of circulation of money.

Secondly, the fact that exchange of commodities is carried on, not by barter, but through the medium of money, is not without an important bearing on the law of wages. The source of profits is undoubtedly, at bottom, the fact that laborers produce more than they consume. But to the employer profits are strictly a money question—a question of receiving more dollars for his commodity than he paid out to laborers for producing it. Anything that disturbs prices disturbs the basis of his operations. A fall of general prices, from whatever cause arising, lessens his margin for making profit—may even destroy it altogether. The wage-fund theory clearly does not imply that, in such a case, the employers must go on paying out money without the prospect of gaining by it, or even with the prospect of loss. On the contrary, it assumes that money-wages must, in such a case, speedily decline. The fall of prices indicates, of itself, a slower conversion of commodity-capital into money-capital. Even if employers had the will to go on paying the old rate of wages, they would presently find themselves unable to continue it. The proportion of their capital locked up in commodities being increased, they have less to offer to laborers. The wage-fund theory was not suggested to account for changes such as this; but there is nothing in such changes at variance with it.

In the opposite case of a rise of prices, the gains of circulating capital will be increased, unless the rise of prices be accompanied by a corresponding rise of money-wages. Would it be so accompanied? The wage-fund theory answers, No, unless previously there was an abnormal accumulation of money-capital waiting for the proper inducement to seek labor. If the old rate of wages was such as to absorb all the circulating capital as quickly as it returned to its possessors, higher wages will not, and cannot, be paid until additional means of payment are forthcoming. Such additional means may be looked for from two sources: (1) a more rapid conversion of commodity-capital into money-capital, through the quickened purchases of consumers; (2) additional savings, attracted by the unusual opportunities for making gain. In either case, and both are probable, wages would tend to rise. Here it is that General Walker's theory and the wage-fund theory are most pointedly at variance. His theory is that in such a case wages must rise at once, without waiting for the increased pressure of money-capital. Employers can afford to pay higher wages, and under free competition they will pay, or will be compelled to pay, higher wages. We confess ourselves at a loss to discover how, in the first place, additional wages *can* be paid before additional means are at hand to pay with; or how, in the second place, competition can accomplish anything in the case. Competition is the great leveller. It will remove inequalities of wages, but it is powerless to raise or to depress the general level of wages. If, indeed, it were open to every penniless upstart to undertake productive enterprises; if laborers could and would really wait to be paid out of product, then we should certainly have a very different state of things. Outsiders could then enter into competition with employers, and, by their added demand for labor, raise wages. But it does not do to forget that, except as against new capital, the possessors of old capital have a strict monopoly. It is futile to speak of what they can afford to do; they will not pay higher wages until they must. But General Walker's view may be that, by their own more urgent competition for the control of labor, they will raise wages. With what motive shall they compete more urgently? To increase production? Clearly not, because to increase production, as production is now carried on, involves the possession of additional plant and materials, and these, by his own assumption, they do not yet possess. If they should increase capital by new savings, or if a more rapid sale of goods to consumers should quicken the circulation of capital, then certainly wages would tend to rise; but that would be a different case from the one under discussion, and would conform to the wage-fund theory. We simply contend that while capital remains unchanged in amount and rapidity of circulation, there can be no rise of wages. The high profits would make men wish to have more circulating capital, or have it return to them more quickly, but would not make them willing to pay higher wages, so long as, at the existing rate, they can reinvest all the circulating capital they have, as quickly as it returns to them.

General Walker finds a serious obstacle to the working of his theory in the fact that wages are always fixed by agreement before production begins. Nothing that happens during or after production can affect the terms of that agreement so far as production has actually gone. The agreement may no doubt be revised, but not so as to apply to the past. Yet he holds that this is but the formal relation of employer and employed. To us it seems the real and final relation in the case. General Walker holds that every mechanical invention, every improvement in production, has the immediate effect of raising wages. We should prefer to say that any improvement which cheapens articles used by the laborers or their families, benefits them quite as effectually as a rise of wages would do. But it is not a rise of wages; such a benefit the laborers share in common with all consumers of the cheapened commodity—they gain, not as laborers, but as purchasers of that commodity. It is difficult to perceive how laborers are to gain by the cheapening of an article that they do *not* purchase.

Finally, General Walker admits—he could not well avoid admitting—that scarcity of capital is attended by a high rate of interest. This is substantially all that the wage-fund theory contends for; in fact, it may be said that it is the wage-fund theory. High interest must, even on General Walker's theory, come out of the products of labor, and leave correspondingly less for the laborers. Wages, then, depend on capital, whether measured by it or not.

The Right and Wrong Uses of the Bible. By Rev. R. Heber Newton. John W. Lovell Co.

It was the opinion of Voltaire that it is not the costly folios, but the thirty-sous books, that serve the purposes of the intellectual reformer. Mr. Newton is evidently of the same opinion, and makes his appeal to the general public in paper covers. There is, again, abundant evidence that he has read the literature of his subject

widely and carefully, but the results at which he has arrived are reproduced with a remarkable freedom from bookishness. A more frequent reference to his technical apparatus would have given a more scholarly appearance to his argument, but it would have been likely to defeat the principal object which he has in view, which is to present a rational doctrine of the Bible in such a form that it will be easily apprehensible by any person of good natural intelligence. To this extent at least he has succeeded. His book is fresh, earnest, hearty; easy to read, and pleasant. However much it may offend the conservative instincts of the majority of Christian people, it cannot be justly charged with the least irreverence. Its enthusiasm for the Bible is its most conspicuous trait. Its most obvious limitations are a certain scrappiness throughout and a remarkable disproportion in the treatment of the Old and New Testaments. "The Power of the Bible is Christ," he tells us, but the amount of space assigned to the New Testament in his seven sermons is insignificant. It is unquestionable, however, that the new readings of the New Testament are quite as significant as the new readings of the Old. The apparent implication of Mr. Newton's sermons is that the Jesus of the New Testament is entirely simple and accessible, which he is not to those who know the ways of the New Testament critics. The unequal and insufficient emphasis which he has given to the New Testament as compared with the Old is doubtless owing to the fact that his later studies have been more especially with the Old Testament scholars. He is under their spell. There is a unity and integrity in their results, an order of development, which the New Testament criticism has not so obviously attained. And so it happens that the impression left by Mr. Newton's sermons is that the Old Testament is much more to him than the New—an impression squarely opposed to his theory of an evolution of religion of which the New Testament is the culmination.

The sermons are seven in number. The first, upon "The Unreal Bible," and the third and fourth, upon "The Wrong Uses of the Bible," are the most clear and definite. The unreal Bible is the "immaculate, infallible, oracular" Bible of the Westminster Confession. Its unreality is shown by such various considerations as that it has little sanction from the Church, as little from the Bible itself; that its growth discredits it; that the theory of it cannot be stated without self-contradiction; that other peoples have held a similar theory concerning other Bibles. The sermon on "The Real Bible" claims for the Bible our natural reverence, because it contains the literature of a noble race, a race preëminently religious, whose literature is as religious as its life, which pressed forward for many centuries, till it realized its ideal in "Christian Israel." The two sermons on "The Wrong Uses of the Bible" should not depend for their acceptance on the entire agreement of the reader with Mr. Newton's critical conclusions. Their considerations are for the most part obviously just, though they are generally disregarded. The sermons on "The Right Critical Use of the Bible" and "The Right Historical Use of the Bible" show that Mr. Newton cordially accepts "the results of the Dutch school," as they are still commonly called, though to-day they are no more characteristic of Kuenen and Oort in Holland than of Reuss and Wellhausen in Germany, Smith and others in Great Britain, Toy and others in the United States. Be it right or wrong, the set of Old Testament criticism is evidently toward this conclusion: that the Prophets, the Law, the Psalms, and not the Law, the Psalms, the Prophets, represent the true order of Israel's religious development.

Mr. Newton's closing sermon, on "The Right Ethical and Spiritual Use of the Bible," is a sufficient answer to the many voices that have charged him with an irreverent assault upon the Holy Scriptures. And yet it may be fairly questioned whether these voices have not a certain logical justification. Mr. Newton would fain believe that rational understanding of the Bible can develop a reverence for it equal to that which it has hitherto enjoyed. With a studious few it may do this. But for the great majority the ethical and spiritual uses which Mr. Newton has set forth are bound up pretty closely with the traditional view of its character. In simple truth, his Bible is the Word of Man, and, as such, it is hardly possible that it should have the influence and authority which has been accorded to it as the Word of God.

The Great Epics of Mediæval Germany. An Outline of their Contents and History. By George Theodore Dippold, of Boston University. Boston: Roberts Bros. 340 pp.

Mr. Dippold's work, though not exhaustive, is a very valuable one. It is an excellent basis of study, and is at the same time of interest to the general reader. In Germany everybody reads the 'Nibelungen Lied,' and to be ignorant of its contents is a disgrace. During the past hundred years a whole army of German scholars have been busy in editing in the original language, in translating and in criticising, commenting and lecturing on, the Nibelung literature. If all the editions of the four prominent versions, the appendages and the fragmentary poems and sagas belonging to the Nibelung cycle, were collected, they would make a large library, and, if to this were added all the translations into modern German, all the commentaries and treatises, and all the dramas and poems based on Nibelung traditions, the result would be a most formidable collection of books. In the English tongue, comparatively little has hitherto been written. We have, of course, very readable essays by such writers as Carlyle and Max Müller. We have metrical and prose translations of the Middle High German version, by Birch (published in London in 1848), by Lettson (1850), and by Auber Forestier (1877); and William Morris has given us both an excellent translation of the most prominent Norse version, and a long original poem based on all the traditions combined and harmonized. But any comprehensive work on this subject the English language did not heretofore contain. We are therefore able to apply a trite phrase to Mr. Dippold's book, and say that it fills a gap in our literature. The author has evidently made a careful study of the German literature pertinent to his theme, and presents in a very convenient form an entertaining synopsis of the contents of the 'Nibelungen Lied,' interspersed with a liberal allowance of spirited metrical translations from the various adventures. To this he has added a tolerably full account of the Northern traditions, with a discussion of their relations to the German version. The mythological elements are pointed out, and the different theories in regard to authorship and historical influences are satisfactorily presented. Much information, also, is imparted in regard to the manuscripts, the metre, the translators, and commentators. In chapter v., which tells of the poetry and art based on Nibelung traditions, Wilhelm Jordan, Morris, Geibel, and Julius Schnorr von Carolsfeld are mentioned, but we miss many important names which ought not to have been omitted.

The work also contains chapters on the charming epic, 'Gudrun,' with outlines of 'Parsifal,' 'Tristan and Isolde,' and 'Iwein,' and an admirable sketch of the development of the Arthur saga and its connection with the legend of the Holy Grail. The author's indebtedness to the leading German scholars in this field of study is fully acknowledged. The mode in which Mr. Dippold has collected and arranged his material deserves especial commendation.

On the Desert. With a Brief Review of Recent Events in Egypt. By Henry M. Field, D.D. Charles Scribner's Sons. 1883.

Dr. Field's journey for this book was from Suez to Mt. Sinai, and thence northward across the desert to Palestine. As he himself says, "the peninsula of Sinai has been a favorite ground of Biblical explorers." He therefore disclaims any intention of writing more than a few notes of sketches on the desert. Of such notes there has also been no lack, for his route was not only long since described by Murray, but has now a well-established place among Cook's regular tours; so that not only for Biblical experts, but for ordinary travellers, it is familiar ground, of which nothing new can be written except the mere personal experiences of the traveller and the varied thoughts and emotions with which he is inspired by the sight of holy places. Such experiences and such thoughts make up this book. The former are such as accompany any ordinary journey in the East with camels; the latter it is difficult to characterize, for they will be judged entirely according to the bias of the reader and the amount of reverential awe possessed by him. There are certain passages whose diction and tenor command attention, but, on the whole, the book is hardly up to the grade of many of a similar character which have preceded it. The eulogy upon Moses seems to have been written as a defence against the attacks of Ingersoll, and the long disquisition on Hebrew polity would form an interesting lecture before a Bible-class during the Lenten season, but is hardly worthy of an enduring place in permanent literature. The two chapters on recent events in Egypt are not directly connected with the journey, and are not superior to the best correspondence of the daily journals of a few months since. Altogether, the book is one of a numerous class which possess chiefly a personal interest for the friends of the writer on his return from a distant land.

Contested Etymologies in the Dictionary of the Rev. W. W. Skeat. By Hensleigh Wedgwood. London: Trübner & Co.; Boston: J. R. Osgood & Co. 1882.

This is an interesting little book, convenient for original workers in English etymology, and full of appetizing curiosities for amateurs. Mr. Wedgwood is well known as one of the liveliest contributors to early numbers of the "Transactions of the Philological Society," and the author of an etymological dictionary, a second edition of which was published by Macmillan & Co. in 1872. It was full of learning and ingenuity, but the author attempted to use the onomatopoetic theory of the origin of language to explain English words, and that threw doubt on the soundness of the whole work.

It is pleasant to find that Mr. Wedgwood takes objection to no more than about two hundred and twenty-five words in Professor Skeat's dictionary, and that the objection to a large number of these relates merely to some far-off deduction or some supposed connection of thought. *Amerce*, for example, is by both derived from the Latin *merces;* but Mr. Skeat takes the meaning as *reward*—to *reward* for ill-desert being to *fine* or *amerce;* whereas Mr. Wedgwood goes to the secondary meaning, *mercy*, and regards to *amerce* as *to put at the mercy* of the court, and he gives quotations from early authors to show

that to have been the original meaning. Abundant quotations like these from rare sources, and parallel forms and phrases from little-known dialects, give the book its principal value to the scholar. But it is a choice collection of etymological puzzles, with many amusing solutions.

Etyma Græca: An Etymological Lexicon of Classical Greek. By Edward Ross Wharton, M.A. London: Rivingtons. 1882.

THE plan of this little book seems to be a good one. It contains first an alphabetical list of Greek words such as are not palpably formed from some other Greek words, with references in most cases by number to the particular phonetic change illustrated, which is given in the following part; this covers 120 pages with some thirty-five words on a page. The second part, giving the phonetic modifications under the three heads of growth, change, and loss, covers twenty-three pages. Two appendices, one on onomatopoetic words and one on loan-words, complete the book. Of the execution of the plan it is difficult to give a just idea without taking too much space. It is not a book fit for a beginner in Greek or for an ordinary college student; and even an advanced student would find other sources of information necessary on account of the extreme conciseness of treatment. To a conservative etymologist it will appear that the writer knows a great deal more than anybody has a right to know on this subject. Stems which most of us are content to regard as primitive, are here confidently analyzed. Many rare words are given from fragments or grammarians' notices, which often add just so much obscurity instead of throwing light on other words. Any one who will look at the words ζάψ, ζωντεῖον, νῶκαρ, σά, and at ἀγανακτέω, ἄναξ, βλάβη, ἕρκος, ἑταῖρος, θεός, κερτόμιος, σφῶι, will see some of the grounds of this opinion. No one could profitably use the book who did not know already enough to judge independently the value of its statements, but to such a man it might be of some use as a handy little compendium.

The Philosophy of Kant in Extracts. Selected by John Watson, LL.D. Kingston: William Baillie, Printer. 1882.

THIS little manual, prepared for facilitating the study of Kant among his own students, by Prof. Watson, of Kingston, Canada, might well find a more extended use. The clumsy redundancy of Kant's style has always seriously hindered readers from getting at his main drift, and the several attempts to make the path clearer by restating the meaning in orderly sequence, abandoning the form, have not met with much success. Indeed, a book of this sort very properly excites suspicion, the reader being unable to determine what proportions of Kant, and what of alien matter, the mixture contains. Prof. Watson's plan is to print the *ipsissima verba*, but to reduce their number. In 200 pages of judicious extracts he lucidly presents the current of thought which meanders through eight or nine hundred pages of Kant's 'Critiques' of Pure Reason, of Practical Reason, and of Judgment. The translations used are those of Müller, Stirling, Abbott, and, in the case of the 'Critique of Judgment,' Prof. Watson's own. For college use, such a series of extracts has many advantages over the full text. For a first reading, private students will find it convenient; and that it has been done by a competent hand the learning and ability of Prof. Watson's earlier book on 'Kant and his English Critics' are a sufficient warrant.

Der Pessimismus und die Sittenlehre. Von Hugo Sommer, Amtsrichter in Blankenburg am Hartz. Haarlem: De Erven F. Bohn. 1882. Pp. 170.

THIS little volume is a clear and timely exposition of the irreconcilable antagonism between modern pessimism, especially Hartmannism, and every sound and practical theory of conscience. Morals, it is argued, is far less a matter of the intellect, or even of the will, than of the heart. A "feeling of oughtness" arises in us long before the concept of *what* we ought, and survives a very high degree of volitional decay; nor can we will without first feeling the value of the end willed. Conscience, or the instinct of "self-preservation of the higher ego," are only other names for this feeling. In feeling of all kinds, and chiefly in this, is found what is general and common to all as opposed to the individual and accidental found in intellect. The final end is what we *really* are; and although, like all views of the whole, we can have no adequate standard of measurement for it—so that it must remain miraculous and poetical, holy—our chief moral aim is to subordinate everything in us and in nature to it, till it appears to us as it truly is, central, final, supreme. The pessimism of E. von Hartmann is based on a false hypostasization of Force, as Schopenhauer's of Will. Blind, impersonal, alogical, anti-rational though it be, it is yet made central and supreme, so that the final end of the universe is made to appear vain, illusive, and nugatory.

From this it follows that the ethics of pessimism, so often regarded as sublime enough to counteract the absurdity of its metaphysics and psychology, must be rejected as chaotic and false, because opposed to the fundamental supposition upon which alone either conscience or the religious feeling can have any authority. "We must pity, love, and redeem the transcendent suffering of the Unconscious," says Hartmann. "Impossible," replies Sommer, "for, just because it is quite unconscious, it is less capable of exciting pity than the lowest of sensitive organisms, while it is by no means apparent how pity can be made the ground of ethics, either theoretically or practically." The complacency with which Hartmann tells those who differ from him that if their stomachs are better fitted for pork and cabbage than for nectar and ambrosia, it is not his fault, is exceedingly offensive to our author; and yet he quite wrongly declares that evolution and materialism culminate in Hartmannism, when the fact is, that the philosophy of the Unconscious is far more a product of the metaphysical than of the scientific spirit. We are far from convinced of any so radical opposition between the Aristotelian standpoint of Dr. Sommer and that of Hartmann, but commend his book to those interested in a vigorous discussion of the subject.

La Botanique. Par J. L. De Lanessan. Paris: C. Reinwald; New York: F. W. Christern. 561 pp., 12mo.

THE author is Associate Professor of Natural History in the Faculty of Medicine, Paris, and is well known as a careful translator of certain English and German scientific works. He is, moreover, an author of a good treatise on zoölogy and of several papers favorable to Darwinism. From these facts it can be easily believed that this work is characterized, firstly, by the incorporation of a good deal of what forms the subject-matter of the larger English and German treatises on botany; secondly, by a broad grasp of the phenomena common to animals and plants; thirdly, by a decidedly evolutionary cast given to the whole; and lastly, of course, by French clearness. Much of what the author's extensive reading has placed him in possession of is here given without any critical comment whatever, and hence there is a good deal of trash mixed in with what is worth keeping. But it may be said to be trash for which he is not directly responsible, except that he could have left it out. As a whole, the work is convenient, very readable, and up with the times; but a volume so crowded with facts, no matter how well arranged, needs a copious index: this has none.

BOOKS OF THE WEEK.

Practical Hints on Rifle Practice, with Military Arms. Orange Judd Co.

Preble, Rear-Admiral G. H. Chronological History of the Origin and Development of Steam Navigation. 1543-1882. Philadelphia: L. R. Hamersly & Co.

Price, A. Who is Sylvia? A Novel. Harper's Franklin Square Library. 20 cents.

Public Health Papers and Reports. Vol. vii. Presented in Savannah in 1881. Boston: Houghton, Mifflin & Co. $5.

Racinet, A. Le Costume Historique. Part 15. J. W. Bouton.

Ritter, F. L. The Realm of Tones. Edward Schuberth & Co.

Robeson, H. J. Diagrams of Parliamentary Rules, according to both Cushing and Robert. Ann Arbor, Mich.: John Moore.

Rolf, W. J. The Two Noble Kinsmen, written by Fletcher and Shakespeare. With engravings. Harper & Bros.

Romanes, G. J. Animal Intelligence. D. Appleton & Co. $1 75.

Schönberg, Dr. G. Handbuch der Politischen Oekonomie. 2 vols. Tübingen: H. Laupp; New York: B. Westermann & Co.

Shakspere's Works. Parchment edition. Vol. iv. D. Appleton & Co. $1 25.

Smiles, S. James Nasmyth. Harper's Franklin Square Library. 20 cents.

Smith, R. B. Life of Lord Lawrence. 2 vols. Charles Scribner's Sons. $5.

Smith, J. A. (State Geologist). Report of the Development of the Mineral, Metallurgical, Agricultural, Pastoral, and Other Resources of Colorado, for the Years 1881 and 1882. Denver: Chain & Hardy. 35 cents.

Street's Indian and Colonial Mercantile Directory for 1882-3. London: G. Street & Co.; New York: S. M. Pettengill & Co.

Taylor, Helen Louisa. Out of the Way. E. & J. B. Young & Co. $1 25.

Zimmern, Helen. The Epic of Kings. Stories Retold from Firdusi. Henry Holt & Co. $2 50.

Zöckler, Prof. O. Handbuch der Theologischen Wissenschaften. 3d half-volume. B. Westermann & Co.

Henry Holt & Co.

HAVE READY:

The Epic of Kings.

Stories Retold from Firdusi. By Helen Zimmern. With a Prefatory Poem by Edmund W. Gosse. 12mo, $2 50.

"The book is charming from beginning to end. A notable addition to the libraries of those who care to know the great classics of the world."—*London Saturday Review.*

Gideon Fleyce.

By H. W. Lucy. 16mo (Leisure-Hour Series), $1. IN LEISURE-MOMENT SERIES (well-made paper, covered boards), 30 cents.

Yale Lectures on Preaching.

Delivered to the Students of Theology at Yale College. By President E. G. Robinson, of Brown University. 12mo, $1 25.

HENRY HOLT & CO., New York.

Binder for the Nation

(RUSSELL'S PATENT).

To receive the current numbers in a convenient form. Substantially made, bound in cloth, with *The Nation* stamped on in gold. Holds one volume. Papers easily and neatly adjusted. Sent, post-paid, on receipt of $1.

Address Publisher of the *Nation*, Box 794, New York.

Fourth Old Book Catalogue

Of SCARCE early editions of STANDARD and ILLUSTRATED BOOKS, etc., etc. (many selected by Mr. LAURIAT during a ten-weeks' trip to Europe, and handsomely bound to order in London), *just ready*, and will be mailed to any address.

ESTES & LAURIAT, 301-305 Washington St., Boston.

The Nation.

NEW YORK, THURSDAY, APRIL 5, 1883.

The Week.

ACCORDING to reports received from Washington, the President seems to be more interested in the question how he can, under the existing law, prolong the interregnum in the Post-office Department a few weeks longer, than in the far more important question whom he will take into the Cabinet as Postmaster-General. It seems the President has not yet learned the great lesson that in such things procrastination creates embarrassment. Of course the choice for so high a place as the Postmaster-Generalship should not be hastily made. But every day's delay invites more advice and encourages more importunity; and after too long a siege and too much confusion of counsel, it is not unfrequently the poorest kind of advice that is followed. The President might have profited by his experience in the matter of the Custom-house appointments, which were put off till the last moment and then landed him between two chairs.

The removal of General L. S. Trowbridge, the Collector of Internal Revenue at Detroit, Mich., is as gross a violation of the principles of civil-service reform as can well be imagined. It is not alleged that General Trowbridge was deficient in the performance of his duty. There seems to be no pretence that the interest of the service required a change. But Senator Conger demanded it, and the other Republican members of the Michigan delegation put their names to a paper asking for it, for no other reason in the world than that Senator Conger asked for it. They were at the same time so fearful of the political consequences of the removal, considering the general esteem in which General Trowbridge was held, that they all desired it postponed until after the last Congressional and Senatorial elections. It seems to be a flagrant case of Senatorial dictation—just that kind of dictation which the Executive must resist at any cost if a thorough and genuine reform of the service on business principles is to be carried through.

Reports are multiplying in the papers that the leading Stalwarts are turning away from President Arthur because he is not "aggressive" enough, that is to say, because he does not turn out all the Half-Breeds still in office and give the places to working politicians of the Stalwart persuasion. Although this defection is probably not as general as is asserted, yet it is undoubtedly quite considerable. There is, for instance, plenty of evidence of dissatisfaction among the Stalwart politicians in this city. The Custom-house appointments did not satisfy them. While the removal of Colonel Burt delighted them, the appointment of General Graham, who, although in no way a sympathizer with thorough reform, is not an efficient party machinist, did not come up to their wishes. The appointment of Mr. Benedict and Mr. Ketcham was still more disappointing. Thus it turns out that while President Arthur forfeited the confidence of the reform element by the ignoble trick employed to get rid of Mr. Burt, the most exemplary man in the service, he failed to attach to himself the Machine politicians. It has been a matter of speculation, upon whose advice he acted in these cases. At Washington Col. George Bliss is pointed out as the potential counsellor. It requires no prophet to predict that the President, if he continues to follow such mentors, will not have a political friend in the world by the time his administration comes to an end.

Every day or two now there are published civil-service reform views of an extraordinary character emanating from Judge Thoman. The latest is a plan attributed to him, under which there is to be "a standard" fixed by the Commission; and all those who reach it, if they number twenty-five or more, are to be recommended to the appointing power, "but there will be nothing to indicate which of the twenty-five had passed the best examination above the standard." It may be that most of the civil-service oddities ascribed to Judge Thoman are invented, some of them perhaps as feelers by those who want to block the reform at the outset. But it is well to say to all whom it may concern that it is useless now to concoct any little devices for not doing it. The subject has been too thoroughly discussed to make it possible to nullify or evade the law by any sort of imposition or subterfuge. If it is to be done, it will have to be done in brazen and open defiance of public opinion. Judge Thoman probably sees as well as we do that the presentation of candidates in batches of twenty-five or more who had come up to "a standard," would soon be in practice the old pass examination of 1852 over again—that is, a humbug and delusion, with all the old abuses of patronage and political favoritism.

There has been a further improvement in the general aspect of money and business affairs during the week. The weather has been more favorable to business throughout the country, and more encouraging accounts of trade are reported from the West. Merchants are selling more goods and making more satisfactory collections. Statistics of the railway traffic centring in Chicago, for the month of March, show a larger business than was ever known before at this season of the year. Seeding of spring wheat has begun in Nebraska and Dakota, and it is now beyond question that the preparations made last autumn for the planting of spring wheat in all the spring-wheat region of the Northwest were on a much larger scale than ever. In the money market there has been a further progress toward ease. The operations of the Treasury have brought in about $4,000,000 for April interest, with $3,000,000 more of the April interest to come within the next few days, and also $5,000,000 to come on the 4th instant in payment of called bonds. During the week, too, there have been imports of about $1,000,000 in gold, and a considerable amount is still in transit. Foreign exchange has, however, advanced beyond the gold-importing point, and it is therefore not probable that imports will be renewed for the present. Within the past week the domestic exchanges in all parts of the United States (which a week ago were against New York) have turned in favor of this city sufficiently to make a decided movement of currency in this direction probable. The general features of the money market, therefore, point to an abundant supply in New York in May. For several days past there has been manipulation of the supply of money for call loans on the Stock Exchange, and the rates have been bid up every afternoon for the purpose of depressing the prices of stocks; but these artificial rates have no effect on the general money market for mercantile purposes. The stock market has been very dull, though prices have been firm, and have even advanced a little; but there seems more disposition to buy good railroad bonds than stocks. This is especially the case with foreign capital. Money is plenty on the Continent, and there is a good foreign demand for American railway bonds, but none for the shares.

The Merchants' Marine Insurance Company of Baltimore has begun proceedings in the Court of Claims to recover money paid for losses incurred through the depredations of the Confederate privateer *Florida*. This brings up the whole question of the claims of the insurance companies to the Geneva Award in a new form. Although Congress has steadily refused to recognize the validity of the demand, the claimants can recover if they can make out that the United States is bound by anything which the Court will recognize as a "contract" to pay them—the Court of Claims having jurisdiction over all claims of this nature. The United States got the $15,500,000 from Great Britain by presenting, among others, these very insurance claims. They got the insurance companies to send them in, they took them to Geneva and there presented them, and the award unquestionably represents them. Now the insurers say: Does not this put the United States under a contract obligation toward us? If not, what is the relation? To give the Court jurisdiction, it is enough that the contract should be what lawyers call "implied"—*i. e.*, made out from all the circumstances of the case.

The *Pall Mall Gazette* treats Dr. Dix's Lenten lectures, on what it calls "the shocking depravity of the American girl," to a somewhat elaborate examination, as in some sense an authoritative view of the condition of the female portion of American society. His picture certainly is a dreadful one, but its effect is so completely neutralized by its extravagance and exaggeration, and let us add, by its great age, that we have not ourselves thought that it called for serious discussion. As the *Pall Mall Gazette* truly remarks, the sins of which he accuses American women "are not specially Ame-

rican sins. They have characterized some portion of the sex ever since the world began, and they have afforded themes for satirists and preachers in all ages; and a good deal of what Dr. Dix has to say has been said long ago in every country under the broad sky." This is true, and it is also true that Dr. Dix has often before now said the same things himself, for the condition of woman has long been a favorite topic with him. In fact, it is not often that a volume of clerical lectures or sermons appears containing so little new matter. His views of the character and duties of woman do not differ greatly from those set out in the Laws of Manu, which, according to the Hindu theologians, were drafted thirty millions of years ago. They are, in fact, the views by which every step in the elevation of woman, from the beast of burden of the savage to the mistress of the modern drawing-room, has been contested by conservative or timid males, lay and clerical. They are the views by which Mussulman theologians would to-day oppose the appearance of woman unveiled in general society. It would, therefore, seem, without meaning any disrespect to Dr. Dix, a waste of time and space to traverse them. They may have been useful to his congregation, but they contain little food for the world at large.

The reason why they attracted so much attention here was that Dr. Dix, when he delivered his lectures, was a member of the Committee of the Trustees of Columbia College which had under consideration the petition for the admission of girls to participation in the instruction given by the College, and because in his lectures he took upon himself, with what it seems to us his colleagues must have considered some want of discretion, to couple the desire for the mysterious thing called "higher education" with the desire which he ascribed to the young women of the day to escape from the fundamental duties of their sex. He, in fact, took the ground that women who wanted the higher education were either openly and consciously, or secretly and unconsciously, inclined to frivolous views of life, to low views of matrimony, to hostility to the great end of marriage, and to general neglect of home life. From a Lenten preacher of a melancholy turn these insinuations would not have startled people or excited much comment, but coming from a Trustee of Columbia College at that particular juncture, such bold defiance of the soundest, most enlightened, most religious, most conscientious judgment of the day in all lands on the condition and needs of female education naturally made a good deal of stir. It would be a great mistake, however, to suppose that Dr. Dix could produce any such sensation speaking either as a theologian or social philosopher simply.

Some rather clumsy attempts are being made to justify Police Justice Smith in discharging Conkling (who shot his sister's paramour in their rooms in this city a fortnight ago), by citing the Code of Criminal Procedure, which gives the magistrate power to discharge the defendant on the preliminary examination, "if it appear either that a crime has not been committed, or that there is no sufficient cause to believe the defendant guilty thereof." But killing a man by assaulting him is always *prima facie* a crime. The presumption of the law is that it is murder; it is the business of the accused to upset this presumption, and the place to do it is before a jury. All that the Police Justice had to do was to ascertain, therefore, whether Haverstick had been killed by an assault. If it was proved that he had been, then it was obligatory on the Justice to find that a crime had been committed. On the point whether Conkling had committed it, there was no question, for he acknowledged the killing. The notion that killing a man with a deadly weapon is not to be considered a crime till the State succeeds in proving that it was *not* done in self-defence, is doubtless an attractive one for the criminal classes, but we hope it will be long before it obtains recognition in our courts. Pistol-carrying ought to be made a costly and dangerous proceeding under any circumstances. In nine cases out of ten the man who saves his life by the use of a pocket pistol, would never have had his life endangered if he had not had the weapon about him. It not only makes him easily provoked but highly provocative, and often leads him into bad company.

Judge Donohue, of the Supreme Court, has been indulging in the strange performance of laying down the law about the Conkling case, and overruling the District Attorney and Recorder Smyth, in an interview with a newspaper reporter. The rulings were worthy of the occasion. Justice Smith, it seems, had a right to discharge Conkling, because he had a right to ascertain whether a crime had been committed, and homicide is not always crime—*e.g.*, when the Sheriff hangs a prisoner it is homicide, and yet not crime. Our esteemed contemporary the *Herald* supports this with a still more powerful and pat illustration—viz., when a soldier kills a foe in battle it is homicide, and yet not crime. The Judge produced another, which is still more staggering—the case of a man breaking into a house to extinguish a fire, who is to the carnal eye a burglar, but to the spiritual eye of a police justice a saviour of property. This is all very entertaining, but it does not get rid of the fact that killing a man with a deadly weapon is always presumably unlawful, and that its lawfulness has to be extraordinarily plain to justify a police magistrate in recognizing it on his own responsibility. A case where an unarmed man is slain in his own house by an armed visitor is, in any civilized country, a case for a jury to pass upon, and not for a police justice, even if he were far wiser and more learned than Justice Smith pretends to be. If such performances as Justice Smith's were tolerated no homicidal brawl need ever reach either the District Attorney or a jury; or, if the McGlorys and McGloins had a friend in court, ever involve more than a night's detention in prison. The people of this city are, however, not yet prepared for this free-and-easy criminal jurisprudence, in spite of the license enjoyed by the Sheriff in hanging criminals, and by the soldier in killing enemies in battle.

General Butler is altogether too sprightly for so dignified an office as the Governorship of Massachusetts. In a recent veto he upbraided the Legislature for having passed the bill in question carelessly and without due consideration, and, by way of reinforcing his argument, he quoted "the Christian emperors of Rome in the third century as having found it necessary to pass decrees against certain methods of holding land." All these things and some others were very tartly expressed in the Governor's veto message, and flung at the head of the Legislature. But it would have been much better for Governor Butler not to do it, for the Judiciary Committee of the Senate has undertaken to look into this veto message, and in a report dissects it most mercilessly. It shows that while the Governor, contrary to all correct principle and precedent, arrogantly presumes to lecture the Legislature for having carelessly passed a bill, he himself in his veto message has proved by the grossest blunders and misrepresentations that he never knew what was in the bill, and probably had never read it when he vetoed it. But, worse than that, the Judiciary Committee teaches the Governor a most humiliating lesson in ancient history, in this wise: "And your Committee are again pained to report that though Rome had been ruled by nearly a hundred emperors before the close of the third century, no Christian emperor had as yet succeeded to the imperial throne of the Cæsars." The Committee gives free vent to its grief over the disgrace thus brought by the blunders of its Governor upon the ancient Commonwealth of Massachusetts, which "from an imperative sense of duty" it has pointed out, at the same time expressing the hope "that in future messages, if there are to be more, we shall be relieved from the necessity and pain of calling attention to such unaccountable mistakes in a Massachusetts state paper." But, to cap the climax, the Committee reminds the Governor, that "the Commonwealth at great expense has purchased and furnished an extensive library conveniently located next door to the Governor's private room, which might be interpreted as a quiet intimation that she will accept no excuse for mistakes and errors of such a character on the part of those who are from time to time called upon to fill her highest office." Thus General Butler is sent back to his school-books.

Columbia College has awakened, after a slumber of more than a century, to the need of taking the public into its confidence. Regarded as an educator merely, it has not by any means been asleep during recent years. It has bestirred itself with zeal and intelligence, adding to its scope and efficiency a law-school, if not the best in the country, certainly not inferior to any, a school of mines and civil engineering of the highest repute, and a school of political science of the highest promise. In other ways it has made itself felt as a prime factor in the educational forces of the United States. But whether it has been too proud or too modest to make its wants known, it has kept its finances very much to itself, and consequently has not shared in the windfall of bequests and donations which have fallen to other institutions of learning in the United States, or only to

the very smallest extent. In the appeal for additional funds made by the Trustees on Monday it is stated that only two gifts of substantial value have been received by the College since its foundation in 1754—one of $25,000 from Mr. Frederick Gebhard, and another, of uncertain amount, from Mr. Stephen Whitney Phœnix, which will not be available for many years to come. The great property of the College, consisting of up-town city lots, was obtained by a trade with the State Legislature more than forty years ago, the College exchanging for these lots other lands which were a part of its original endowment. Neither the one nor the other of these tracts was then deemed of any considerable value, but the up-town property has now come to yield the large sum of $214,849 in ground rents, free of tax, which is equal to a capital of over $4,000,000 at 5 per cent. Large as this sum looks on paper, it is much less than the needs of the College, if the design is taken up of making it a university akin to those of Germany, where post-graduate education may be had to the highest attainable degree, or even if the present march of improvement is to be followed up. Columbia, therefore, comes before the public, hat in hand, like other colleges, and asks for $4,000,000 to complete its endowment.

Poor Lady Florence Dixie has been going through a process nearly as trying as being stabbed by Fenians—namely, the process of having the attack on her investigated. The first accounts of the assault, including her own in the London papers, have now come out, and they are, in the light of the later discoveries, very amusing reading to the public, though doubtless serious enough to her. In the first place, the assault was at first committed in a secluded and remote plantation. It now appears it was in an open grove, in full view of the road, the sidewalk of which looked down on it from a distance of about nine yards. At first, too, the ground on which the horror took place was scored heavily by the marks of the fearful struggle, some of the tracks being evidently made by "brogues," and everybody knew what kind of people they are who wear "brogues." But now not even the most suspicious and searching gaze has been able to discover a trace of the struggle in the soil. Moreover, the assailants were two tall men dressed in women's clothes, one of them who did the dreadful work being clad in green, and everybody knew to what nationality murderers belong who wear green clothes; but, remarkable as such persons would have been on a much frequented highroad, and in a thickly-peopled neighborhood, not a soul can be found who saw them or anything like them. At first they escaped for certain in a yellow dog-cart, which was seen driving past about that time, but the man who drove it has appeared. He was a groom taking his wife to visit her sister. And then a gardener, a soldier, a woman, a hotel-keeper, who were all near the spot when the crime was committed, and in full view of it, say they saw and heard nothing. The dog, too, a huge Newfoundland, fails to show a single scratch, and, worse than all, so does Lady Florence, although she says "the man who bent over me with a dagger had an awful look of determination stamped on his face. His features were livid, and his white teeth firmly clinched." To work himself up in this way simply to cut a lady's corsets was a ridiculous thing, even for an Irish assassin. To crown her misfortunes, there now appears a "gentleman from Eton, in a high position, and deposes that he saw Lady Florence Dixie the whole time she was standing on the spot where the alleged outrage was committed, and saw her walk away without anybody accosting her."

The revelations which the Spanish courts and police are making about the operations of the secret society called the Black Hand, in Andalusia, show that it far surpasses, in power and extent, anything which the anarchical movement has produced either in France or Russia or Ireland. The province appears to have been honeycombed with secret societies acting under a central head, and executing its orders with blind obedience. These orders involved every variety of crime, such as murder, assault, house-burning, the destruction of vineyards, and the mutilation of cattle. Obnoxious persons, such as landlords, bailiffs, shopkeepers, tavernkeepers, or others suspected of giving information to the police, were tried at the monthly meetings of the League, and, if condemned, the task of murdering them or burning their houses was formally committed, as in Ireland, to a committee of the initiated. Nor does the membership appear to have been confined to one class of society. The 360 prisoners who were recently brought into Xeres by the police were not only of all ages, but included small landholders as well as simple peasants, and smugglers, and escaped or discharged criminals. The sending of threatening letters to landlords and employers, as well as to judges and police officers, appears to have been, as in Ireland, a part of the regular business of the malcontents.

Opinions vary as to whether the Black Hand has any connection with the International or other foreign Anarchists. There are Socialist organizations among the workingmen in many of the large towns in Spain, but there does not appear to be any good reason for believing that either they or the foreign societies have done much to propagate their ideas among the peasantry. Some of their documents have been found in the hands of members of the Black Hand, and some of the prisoners talk Collectivism, and Anarchism, and Nihilism, but apparently without having got hold of the true inwardness of these movements. The better opinion is that the Black Hand is a purely agrarian and purely Andalusian movement, without any inspiration from the outside. The Andalusians are very ignorant and superstitious, and very suspicious of everything foreign, and therefore very unlikely to offer a good field to agents of the International, although, of course, the chiefs of the International are eager enough to claim the operations of the Black Hand as a fresh illustration of their power, just as O'Donovan Rossa likes to claim all the Irish outrages as his doing. There are plenty of reasons, too, in the condition of the province for believing these disorders to be of purely local origin. The land is held almost exclusively in very large estates, the owners of which live in Madrid or other cities, and manage their property through agents or factors. The cultivation of the soil carried on under these conditions is of the most wretched description. The laborers employed on it are poorly paid, so poorly as to get even in good times a bare subsistence, and the farmers are not much better off. For several years back the crops have been ruined by drought, reducing a large part of the country population to absolute want. Under the patriarchal or feudal constitution of society, it was the custom in the province, when such crises occurred, for the landlords to take care of the poor, and although they did not take very good care, they took enough to prevent wild discontent. Of late years, however, the rich have felt themselves absolved from this duty by the growing power of the Government and the importation of foreign ideas. They have had less and less to do with the peasantry, and, when this last dearth came, left them to take care of themselves.

The Lords Justices of Appeal in England have decided probably the most curious club case that ever came before a court. Two brothers of Mr. Chamberlain, the President of the Board of Trade, were blackballed at the Reform Club, to the great disgust of Mr. Bright, the Marquis of Hartington, and other prominent Liberals, who thereupon attempted to get the constitution of the club amended, so as to substitute admission by the committee for election by the ballots of all the members. This was defeated, however, and the Messrs. Chamberlain ascribed its defeat to a story reflecting on their character, set afloat by a member of the club named Boyd. They therefore sued him, and he demurred, on the ground that the damage he had done them, if any, was too remote to be appreciable, inasmuch as what he had deprived them of, if anything, was the chance of being admitted to the club in case a certain change in the constitution was effected, which is something which could not be estimated by a jury. The Court sustained the demurrer. The damage was even more indirect than any that was alleged in the *Alabama* case.

The legal newspapers in London have been recording a new attempt on the part of the courts to resort to practical tests of the truth of testimony, such as created so much interest in the case of Belt against Lawes. In that lawsuit a sculptor was allowed to model in court, to show what kind of a sculptor he was. In the last case two German firms were disputing the exclusive right in certain patents for improvements in the production of coloring matter suitable for dyeing and printing. Experts swore that a certain combination of chemicals was dangerous to life, and the Judge allowed an experiment to be made to see whether this was true. The result was such that the Judge, counsel, witnesses, and bystanders fled for their lives; but as they all escaped, the test cannot be regarded as conclusive. There seem to be limits to the utility of evidence of this sort.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 28, to TUESDAY, April 3, 1883, inclusive.]

DOMESTIC.

MUNICIPAL elections were held in many Western towns on Monday. Cincinnati elected a Democratic Mayor by about 1,700 majority. The Republicans elected some of the minor officers. Dayton went Democratic, and Cleveland elected a Mayor of the same party by nearly 4,000 majority. In Toledo the Republicans elected a Mayor by 83 majority, and the Democrats many of the other officers. In Dubuque, Iowa, the entire Democratic ticket was elected. In Chicago the election for Mayor on Tuesday resulted in a majority of about 10,000 for Carter Harrison, the Democratic candidate and present incumbent. This is an increased majority.

The President on Friday appointed Mr. E. O. Graves to be Assistant Treasurer of the United States, to fill the place of Mr. A. U. Wyman, promoted to be Treasurer. The latter took formal possession of the Treasury on Monday. A committee was appointed to count the funds, and on Tuesday it was announced that there was an overplus of one cent in cash.

President Arthur, his private secretary, Mr. Chandler, Secretary of the Navy, and several other friends will start in a few days for an island in one of the Florida rivers, where they will spend a short vacation in fishing.

Secretary Folger is so much improved in health that his friends think he will be able soon to start on a voyage to the Bermudas. On Friday he appointed as Chief of the Bureau of Engraving and Printing Captain T. M. Burrill, of Penn Yan, N. Y., who for four years has been the Purchasing Agent of the Bureau.

During the month of March the reduction of the public debt was $9,344,826 27.

An act passed by Congress at its last session, to prevent the importation of adulterated teas, authorized the Secretary of the Treasury to appoint an Examiner of Teas, at an annual salary of $2,500. James R. Daves has been appointed to the place by Secretary Folger. Mr. Daves is a well-known member of the Republican Machine of this city. He was for many years engaged in the tea business, in which he is regarded as an expert.

The Acting Secretary of the Treasury has decided that the rate of duty, as between the old and the new tariff, is to be fixed by the date of the arrival of the importing vessel at the exterior port of entry; and that goods imported before the new act takes effect and shipped to Western ports under the Immediate Transportation Act will be dutiable under the present tariff, unless they remain in public store or bonded warehouse when the act goes into operation.

Judge Lawrence, First Comptroller of the Treasury, has decided that Congressman Ochiltree, of Texas, is entitled to his regular salary, notwithstanding the fact that the Government holds a judgment against him for $6,890. The decision is made on the ground that the Constitution imperatively orders that a Congressman shall receive compensation as fixed by law. As regards Territorial delegates, their salary may be withheld for judgments, because the office is not created by the Constitution.

Postmaster-General Howe's funeral took place at Kenosha, Wis., on Wednesday. The services were exceedingly simple. The Rev. Robert Collyer made an address. At Green Bay, Wis., on Thursday, the body was interred.

The Naval Advisory Board appointed—pursuant to act of Congress—for the purpose of investigating and reporting if, in their judgment, it be advisable to close up or sell any of the existing Navy-yards, will, it is said, report in favor of equipping the League Island Yard with all the plant and machinery necessary for the construction of iron and steel ships.

The *Jeannette* Court of Inquiry reconvened on Friday in Washington, and examined the three seamen of that expedition who have recently returned from Siberia. They all said they had no complaints to make against the officers of the expedition, and awarded high praise to Lieutenant Danenhower. That officer has just been granted a year's leave of absence. Another session of the Court was held on Tuesday, at which it was announced that the charges of Dr. Collins would probably be investigated.

Ex-President Diaz, of Mexico, and party, visited Mount Vernon on Thursday with a distinguished party of Government officials. In the evening he was entertained at the Mexican legation in Washington. On Friday morning he came to New York, where he will remain for some time.

Ex-Representative Butterworth, of Ohio, has been appointed a Government Commissioner for the Northern Pacific Railroad.

In the Star-route trial the most important event of the week was the continuation of Dorsey's testimony. On Wednesday he testified in regard to the Clendenning letter, in which that postmaster was cautioned not to allow certain prominent mail contractors to know of his (Dorsey's) request for the approval of the bonds. This he explained by saying that he feared they might knowingly underbid for the service. General denials were made of nearly all of Moore's and many of Rerdell's statements in regard to witness. On Thursday Dorsey emphatically denied that he had ever given a check for $2,000 to J. B. Belford, of Colorado, or told Rerdell to charge a check for that or any other amount to J. B. B., upon the books. The cross-examination on Friday disclosed nothing new, the witness taking every opportunity to deliver an evasive answer.

The eighteenth week of the trial was begun on Monday. The defence refused to produce certain letter-press copybooks. The Court decided that in the present case the notice for the production of the books was confined to strictly secondary evidence—letter-press copies—and even if more specific, the other side could not be called upon to produce it. Dorsey's cross-examination was concluded on Tuesday.

Judge J. B. Bissell, of Colorado, insists that he received a $2,000 check from Dorsey, notwithstanding the latter's denial, and asserts that it was paid as the result of a game of poker. This is supposed to be the famous "J. B. B." check testified about by Rerdell.

Ex-Senator Kellogg is very indignant that the Grand Jury have found indictments against him on the new Star-route cases. He asserts that Walsh's stories originate entirely in an attempt to blackmail. Brady's counsel make light of the new indictments.

Serious Indian troubles have broken out in southeastern Arizona. Twenty-one people have been murdered there in seven days. There are also dangerous bands in New Mexico, which have committed outrages.

The Rev. Jonathan Blanchard, President of Wheaton College, in Illinois, in preaching a funeral sermon in Washington, on Sunday, over the body of a young man who in life had been a prominent member of the Grand Army of the Republic, the Knights of Pythias, and the Independent Order of Mechanics, made some remarks denunciatory of secret societies. The sister of the dead man became excited, and fainted. Her husband asked the preacher to desist, but he would not until requested by the father of the dead man. The societies were present at the services.

N. L. Dukes has declined to accept his seat in the Pennsylvania House of Representatives, owing to the intense feeling against him, and it has been declared vacant by the Speaker and a new election ordered.

At Albany the Democrats of the Legislature are seriously at variance on questions pertaining to prison management. In the Senate this class of bills has been obstructed by Democratic votes, and in the Assembly there is no prospect of harmony in respect to them. On Wednesday there was a lively discussion of a proposed amendment to the code, allowing fishing on Sunday in New York Bay and contiguous waters. The Assembly refused, by a vote of 50 to 47, to order the bill to a third reading so amended, and it went back to the Committee of the Whole. The Niagara Falls Park Bill was adversely reported in the Senate. This report was disagreed to, and by a vote of 20 to 11 the bill was committed to the Committee of the Whole. A long debate on the resolution proposing a prohibitory liquor amendment to the Constitution then took place in Committee of the Whole. On Thursday the Senate passed the bill to repeal the act of 1881 for the removal of the Forty-second Street Reservoir in New York city. After two hours' debate on Friday, the Assembly passed the bill regulating the charges of grain elevators, by a vote of 79 to 30. It was favorably reported in the Senate on the same day.

The Senate on Tuesday passed the Political Assessment Bill, after amending it so that it prohibits the giving of money or any valuable thing "for appointment or election to, or retention in, office," instead of "for any political object whatever," which was the original reading. The bill now goes back to the Assembly.

Governor Cleveland on Friday signed the Capitol Commission Bill, and nominated for the Commissioner Isaac G. Perry, of Binghamton. The nomination was a surprise to the politicians of both parties. Mr. Perry is said to be a competent architect, and was not an applicant for the position. He is a Democrat, but is endorsed by leading men of both parties as thoroughly fitted for the place. It is said that he will soon assume the duties of his position, and that there is no intention of changing the architecture. Some poorly-supported charges have been made against Mr. Perry by party factions.

A special committee of the Board of Trustees of Columbia College presented a report to the full Board on Monday in regard to the financial needs of the institution. They recommended that steps be taken to thoroughly equip the College for higher and complete instruction, equal to that of the foreign universities. President Barnard said that an additional endowment of $4,000,000 would be necessary to give to Columbia the character of a well-equipped university. The report of the committee was adopted.

The Grand Jury for the March term of the Court of General Sessions in this city on Friday presented an indictment against George W. Conkling, jr., charging him with manslaughter in the first degree in shooting Wilbur H. Haverstick. It will be remembered that he was recently discharged by Justice Smith. The prisoner was admitted to bail in the sum of $5,000.

Salmi Morse gave a so-called private rehearsal of the Passion Play in this city on Friday evening. The building was crowded.

Frank Byrne, recently arrested in Paris on suspicion of being concerned in the Dublin assassinations, but discharged from custody by the French Government, arrived in this city on Wednesday. He was Secretary of the National Land League of Great Britain up to March 17.

A resolution providing for biennial elections of State officers and biennial sessions of the Legislature was passed by the Massachusetts House on Wednesday, and Senate on Tuesday.

A report has been made by the Judiciary Committee of the Massachusetts Senate upon

Governor Butler's veto of the Somerville Land Company Bill. In his message the Governor took both branches sharply to task for careless legislation. The report criticises with equal severity the Governor's action, terming it "undignified and unbecoming," and calling attention to many errors and blunders which the message contained.

Conductor E. L. Hosley, of the New Haven and Northampton Railroad, was found guilty of manslaughter in the Superior Court at Greenfield, Mass., on Thursday, for disobeying orders and causing a collision on the State Road last September, in which three persons were killed and others wounded.

By a displaced rail on the Cincinnati Southern Railroad, a train was thrown down a high embankment on Friday, and sixty persons were seriously injured.

The Supreme Court of Illinois, the full bench assenting, has filed its opinion declaring in substance that the Pullman Palace Car Company and like corporations are common carriers, placing them in the same category as railroad companies.

The bill fixing saloon licenses in the State at $500 a year has passed its second reading in the Illinois Legislature.

Lewis L. Delafield, a well-known lawyer of this city, died on Wednesday morning, in the forty-ninth year of his age. He was one of the founders of the Bar Association, and was prominent as counsel of the Society for the Prevention of Cruelty to Children.

General A. B. Buford died in Chicago on Wednesday night, at the age of seventy-six. He was a graduate of West Point, and was a distinguished officer of volunteers during the civil war. At its close he was brevetted Major-General of Volunteers for gallant and meritorious conduct during the Rebellion.

FOREIGN.

A man named Dennis Deasy, who carried a box containing explosives and infernal machines, and a railway porter named Patrick Flanagan, supposed to be his accomplice, were arrested at Liverpool on Thursday. They had just arrived from Cork. They were arraigned on Saturday. At the examination it was put in evidence that a letter was found upon the person of Dennis Deasy commending him to the other conspirator, Patrick Flanagan, as a person who might be intrusted with any post of duty. At Flanagan's lodgings a variety of explosives were discovered, besides a revolver, a false beard, and other equipments for dynamite war and for disguise. The most interesting evidence given during the examination was that of expert scientific witnesses, who testified that the explosive material in question was known as "lignine dynamite," an article that could not by any possibility be connected with commercial or business transactions, and which was not made for any legitimate purpose.

An American named Featherstone and a Parnellite named O'Herlihy were arrested at Cork on Thursday charged with conspiracy to murder. Carmody, a plasterer, was also arrested. It is supposed that Deasy, arrested at Liverpool, gave the information. The Liverpool police were informed that the arrests prevented the destruction of public buildings, with a possible great loss of life. On Friday morning the three men under arrest at Cork were arraigned for being members of a secret society, the object of which was to commit murders wherever it was believed that such a course would advance the interests of their organization, and to blow up buildings in the principal cities of the British Isles. Upon a preliminary examination bail was refused, it being strongly intimated by counsel for the prosecution that a number of witnesses were ready to testify in support of the charges.

The police of Cork have reason to believe that an infernal-machine manufactory has been established in that locality. On Monday it was announced that the British War Office had taken the question of explosives in hand vigorously, and had ordered that experiments be undertaken with a view to preparing an analysis of the various forms and component parts of all substances that are capable of being employed as explosives. The knowledge thus gained will be given to the police. Measures have also been taken to guard buildings in London, and especially the gas-works.

A letter, purporting to be from Fenians, is in possession of the London police, threatening to blow up the Central Telegraph office in that city unless the men charged with the Phœnix Park murders are at once released. The passage which underlies the London residence of Mr. Gladstone is now closed at sunset, as a precaution against Irish plots.

An anonymous letter has been published in London which asserts that the Fenians are engaged in sending packages containing linen infected with smallpox to persons who are obnoxious to the Irish National party.

Judge Lawson sentenced twelve of the convicted members of the Armagh, Ireland, Assassination Society on Wednesday to terms of penal servitude varying from five to ten years.

The police inquiry into the alleged attack upon Lady Florence Dixie has so far been futile. A gentleman from Eton, of high position, has deposed that he saw Lady Florence Dixie the whole time she was standing on the spot where the alleged outrage was committed, and saw her walk away without anybody accosting her.

It is said that Minister Lowell will not intercede in the case of Michael Boyton, recently rearrested in Ireland, as it has previously been proved that he is not an American citizen.

One hundred and fifty persons have left the Island of Achill, County of Mayo, on the west coast of Ireland, and sailed for America. They were driven from their homes by famine.

Mr. Parnell has received a letter from William Redmond saying that his work of organizing the Land Leaguers in Australia is succeeding far beyond his expectations.

The Vatican is displeased with Archbishop Croke, of Cashel, Ireland, for opening a subscription list for the relief of Mr. Parnell.

During a debate in the House of Commons on Monday Mr. Parnell urged that further executions in Ireland should be suspended until the Court of Criminal Appeal had been established and put in operation.

The returns for the financial year ending March 31 show that the revenue of Great Britain was £89,004,000 and the total expenditures £89,086,000.

Queen Victoria is rapidly recovering the use of her knee, but she will not quit Windsor Castle for Osborne until the end of this week.

John Brown, the personal attendant of Queen Victoria for many years, died at Windsor Castle on Wednesday. He was the favorite Scotch gillie of the Prince Consort in the early years of his marriage.

The Most Rev. Edward W. Benson was enthroned as Archbishop of Canterbury, England, at that place, on Thursday, with appropriate ceremonies.

Louise Michel permitted herself to be arrested in Paris on Friday rather than subject her mother to any further annoyance from the police. The specific charge brought against her was that she had entered bakers' shops at the head of an armed band and had plundered them of their contents.

Prince Napoleon's manifesto was again posted in Paris on Friday, but was immediately removed by the police.

The French Minister of the Interior and the Minister of Justice have signed a contract with the Crédit Foncier, by which the latter engages to build dwellings to alleviate the crisis caused in Paris by high rents.

M. Léon Say, speaking at Lyons, France, last week, advocated the opening of fresh outlets for commerce, which he said would be of more advantage to France than protection.

Count de Lesseps asserts that his recent explorations make it plain that the inland sea in the Desert of Sahara is practicable, and that it can be accomplished by using 100 excavating machines equal in their aggregate capacity to the labor of 100,000 men.

By a boiler explosion at St.-Dizier, France, on Sunday, thirty-five persons were killed and sixty-five injured, many of them fatally.

The recent speech of Signor Mancini, Italian Minister of Foreign Affairs, in the Chamber of Deputies, in regard to the existing relations between Italy, Germany, and Austria, is believed to refer to a defensive triple alliance against France, with whom all agreed to endeavor to maintain friendship. On Tuesday it was officially denied in Rome that such an alliance existed, but it is believed that a similar agreement exists in an informal shape.

The fourth centennial of the birth of Raphael was celebrated at Rome with great pomp on Wednesday.

The Vatican, it is said, is inclined to facilitate a settlement with Prussia, and a Cardinal who is regarded by the latter as a hindrance is soon to leave Rome.

It is officially announced that the Emperor William of Germany has virtually recovered his usual health. Prince Bismarck is suffering with neuralgia.

There was a brilliant celebration in Berlin, on Sunday, of the sixty-eighth birthday anniversary of Prince Bismarck. The Emperor William visited him in person.

It is currently reported in Hamburg that Bismarck intends to revive the Prussian State Council, by which all bills proposed by the Government must be passed before they are introduced into Parliament. This is regarded as a reactionary measure.

German artists have petitioned their Government to intercede with the United States regarding the increased tariff on works of art.

The Spanish Government has consented to the release of Castillo and Rodriguez, the Cuban refugees, owing to the request of Great Britain. Maceo, the other refugee, will still be held in confinement, but will be leniently treated.

Count von Majláth von Szekhély, President of the Court of Cassation, was found murdered at his residence at Ofen, Hungary, on Thursday. He had been strangled, and his tongue had been cut out. The house had been robbed. A hussar stationed near was arrested on suspicion. It is known that he has been holding secret relations with two persons in no way connected with the Count's household.

The St. Petersburg Prefect of Police has unearthed a band of Nihilists at their rendezvous in that city. When the police attempted to capture them a stubborn fight ensued. Three officers were wounded, and one Nihilist, rather than submit to be captured, committed suicide. The eight remaining conspirators were arrested. One hundred and forty-four pounds of dynamite were found.

A secret report was recently presented to the Sultan, in which it is charged that several of the Turkish Ministers and high officers of the Government had entered into an arrangement by which they were to receive bribes in connection with the collection of the tobacco taxes. The Ministers accused tendered their resignations, but the Sultan refused to accept them.

The message of the Mexican President, sent to that Congress on Monday, announces that the Guatemala question is definitively settled. He will present the draft of a commercial treaty with the United States to the Senate for ratification when he deems that the proper time has arrived.

AN ENGLISH DREAM OF "AMERICANIZATION."

THE Rev. F. Barham Zincke is an English clergyman and "Chaplain in Ordinary" to the Queen, who travelled a good deal in this country some ten years ago, and showed himself a careful and competent observer. He has since been a prominent and able advocate in the English reviews of peasant proprietorship in land, and a warm opponent of landlordism and the social system based upon it in England, which, he agrees with Matthew Arnold in thinking, "has materialized the upper, vulgarized the middle, and brutalized the lower classes."

He has now published in pamphlet form a paper which, he says, he prepared two years ago, and which is the first formal attempt we have seen from an English pen to give expression to the speculations in which so many Englishmen are secretly indulging, as to the probable effect on the world, within the next century, of the continued growth at its present rate of the English-speaking democracy, or "Englishry," as he prefers to call it. He calculates that by 1980 the United States will contain a population of 800,000,000; Canada, 64,000,000; Australia, 48,000,000; South Africa, 16,000,000; and the United Kingdom 70,000,000—in all about 1,000,000,000 of English-speaking men, living under substantially the same institutions, and cherishing the same social and political ideals. Of course the 800,000,000 which he assigns to the United States will not be confined to the American Union as it now is. They will overflow into Canada at the north, and into Mexico at the south, and occupy it, and also Guatemala, Colombia, Bolivia, and Peru, and will afterward pour into the valley of the Amazon, and spread along the whole range of the Andes, and into the islands of the Pacific, across which they will join hands with their kindred in New Zealand and Australia. More than this, they will flow back into England and take their places, under the new land régime in that country, among the restored yeomanry to which their forefathers belonged, and which will again become, landlordism having disappeared, the foremost class in English society. In like manner the English settlements in South Africa, which are now essentially American in their manners and ideas, will spread over Southern Africa, pushing the native tribes back toward the Equator, and for the first time in history opening "the dark continent" to civilization, and placing its enormous resources at the disposal of the most advanced portion of the human race. When all this is accomplished, it may be said that one thousand millions of the flower of the species will have taken possession of and be living happily on the most favored portion of the globe.

What kind of society will it be which this "Englishry" will establish? What will be its social and moral standards, its notions about life and death and judgment, things present and things to come? There's the rub. Census and customs "returns" are great and wonderful things, in which the eye of the modern man delights, but they tell only a very small part of a nation's story after all. That must be sought in its manners and ideas. What kind of manners and ideas, then, will these one thousand millions have? That their manners and ideas will be fundamentally the same throughout, Mr. Barham Zincke assumes, although he maintains that difference of climate and soil will produce enough variety to prevent that dull and dreary monotony which the enemies of democracy are fond of predicting as the consequence of its triumph. He thinks the American farmer will furnish the type of the new society, and we must quote his own account of the general result:

"Among these thousand millions there will be none without any civilization at all; none with an incapacity for getting beyond a low state of civilization; none whose civilization suffered an early and permanent arrest; no savages, no serfs, no slaves; not many drones or Sybarites. They will be 1,000,000,000 who will not only be able to read and write, but also be disposed to turn these instruments of knowledge to excellent account. They will have homes of their own, and property enough of the very best and most educative kind—that is, in land—to yield to their intelligent industry sufficient means of support. They will have no social or political superiors, and therefore will manage themselves their own affairs. Society, and legislation, and the administration of affairs will be to them, as nature intended them to be, most effective means of education. Nor will there be among them any considerable percentage who have received, or are receiving, or who are looking forward to receive, a pauper's maintenance, and who therefore are intellectually useless and morally injurious to society. The lives of the vast majority of them, that will be spent in the cultivation of their own land with their own hands, will be in harmony with nature; and that not on the hard terms of the European peasant, but in the well-provided fashion of the open-handed American farmer. It will then be clear to every one's apprehension that it is not merely the faculty of speech and the formation of the hand that constitute a man, but in addition the possession of a portion of this earth, the common inheritance of all, at least for a home upon it of his own, if not more or less for his support; and that men are not so truly men as mere drudges when they are obliged to spend their lives without ever attaining to homes of their own—the home being the chiefest of Nature's humanizers; and in cultivating other people's land without hope—life without hope being death in life. The settlement in this fashion of vast continents will, indeed, be a moral renewal of the face of the earth. It will even give a new aspect to man's relations to the unseen world. It will be the bringing in of a new dispensation, of a new earth, and of a new heaven."

Morality, Mr. Zincke thinks, will in this society have a tremendous force, because there will be only one morality for all, and not as now a separate morality for each class, and it will be supported by the opinion of all. The conscience of the community will be a power such as has hitherto been unknown in the world. Women will play a larger part in the work of society than they have ever done. No pursuits will be favored by endowments or bounties, so that none of the talent of the community will be diverted into useless or false channels. It will stand constantly waiting for the real and natural demands on it. The competition between nations will be intellectual, not military, competition; and the human intellect will be under a stimulation such as has never before acted on it. The applause and admiration of 1,000,000,000 will rouse the faculties of the capable to their very highest efforts. Oratory, painting, sculpture, and architecture will grow under it as never before, and poetry will certainly be as needful as ever to satisfy the cravings of a society which has substituted freedom, increased knowledge, and improved morality for slavery, semi-slavery, poverty, and social injustice. Money will be in greater use and the precious metals have a higher value than ever. Religion, too, will have as strong a hold as ever on the human heart, for what is religion but knowledge organized for the regulation of conduct? At the head of this mighty community the United States will stand morally though not politically. The President of the United States will be its foremost man; "the predominant power" will be the press; and "none will have so wide and deep an influence as great writers and great speakers, who will be reported by the press."

The dream seems in places a wild one, but we doubt if any one can read it without, when he lays it down, finding it very hard to furnish a good reason for doubting it.

THE MARKET FOR ACCUSATORY FICTION.

THE case of Lady Florence Dixie is interesting as a fresh illustration of the certainty with which strong popular hostility to or suspicion of a class produces trumped-up charges against it. The law of demand and supply seems to work in this field almost as effectively as in the market for commodities. As soon as the popular readiness to believe discreditable stories about somebody shows itself unmistakably, men and women step forward with the stories all ready made and adapted to every taste. When Titus Oates, who has now become the typical informer of history, began his career in the seventeenth century, it was suggested to him by the popular distrust of the Catholics, and the popular fear that the Court was "going over to Rome." His first tale, that the Jesuits were going to kill the King and abolish the Protestant Church, did not take, but he was not discouraged. He knew that the demand existed, and that all he had to do was to try new styles in his goods till he hit the popular taste. So he enlarged and improved his story, and when the magistrate who issued warrants on it was found dead one morning, Oates's fortune was made. The whole kingdom was in a blaze, and he found that he could not make his accounts of the designs of the Papists too hot or strong. He received a large salary and free lodgings, and went on amending and embellishing his news every day. Several persons were convicted and one peer was executed on his testimony before the public got sick of him, and yet he had been all his life a man of notoriously bad character, and had been expelled from the ministry for perjury before he took up the trade of an informer.

The witch craze in New England not long after was another exemplification of the efficacy of popular credulity in producing false testimony. There was a crowd of witnesses—many, if not most of them, respectable people—to the doings of the witches; and, what is more extraordinary, the popular demand for witch stories acted so powerfully on some women that they confessed that they were witches, and that they practised the black art on their neighbors. And this was not in the dark ages: the New England witches were contemporaries of Isaac Newton and John Locke.

We had phenomena of somewhat the same

character here during the reconstruction period at the South. The popular mind at the North was very much excited about the condition of the negroes and the ill-treatment to which they were exposed at the hands of the whites. There was a good deal of foundation for this feeling in the Ku-klux movement and in the resistance of the whites everywhere to the appearance of the blacks in the political arena. But as soon as the Northern readiness to believe stories of outrages was well ascertained, a regular manufactory of them seems to have sprung up at the South. They came on by the dozen, especially during political campaigns, and at last began to lose all semblance of probability. One political club of colored men in Mississippi finally issued an address, in which they asserted that it was not uncommon to see long rows of colored people, including pregnant women, hanging to trees by the roadside in certain parts of the South, and one Southern correspondent of a morning paper in this city mentioned gravely, as a piece of news, that Christmas Day and the Fourth of July were every year set apart by Southern young men for shooting negroes.

Mr. Harrison, who has been writing very interesting and instructive articles in the *Atlantic Monthly* on the condition of Southern society, reports a visit to one of the concoctors of these tales living in Alabama at present. He acknowledged laughingly that his were mostly fictions, but justified them on the ground that they gave Northern people a fair idea of the state of things at the South. Titus Oates would have justified, and probably did justify, his inventions in the same way. Even if not true, they gave Englishmen a good idea of the kind of people the Papists and the Jesuits were, and of the kind of designs of which they were capable.

In like manner, when colored cadets began to find their way into West Point, and encountered there also the color prejudice which existed everywhere else in the country, the public mind was much impressed by the hardship it must entail on a colored youth when shut up, in close contact at every hour of his day, with whites who despised him. There accordingly grew up rapidly a feeling of strong hostility to West Point, and to every white person in it, from the Commandant down, and a corresponding readiness to believe anything that might be told of the capacity of the officers and cadets in the matter of arrogance, cruelty, and unfairness. This state of feeling had not lasted very long before Cadet Whittaker produced a justification for it in the extraordinary story—so like Lady Florence Dixie's—of his being set upon, cut, and bound; and he had proved such an excellent judge of his market that, in the teeth of glaring improbabilities of all sorts in his tale, it took two elaborate and prolonged and expensive inquiries to spoil his wares. He, however, was far more adroit than Lady Florence, because he lay in his swoon till he was found. She foolishly recovered from it alone, and walked home. He cut his ears, too, in a liberal and manly way, while she, womanlike, was afraid to let the knife touch her skin. The failure in both cases shows, however, the value of the press at times of popular excitement. Titus Oates's stories could not have survived a week the criticism which, doubtless, scores of writers even at that day could have given them, had they had any means of reaching the public.

NATIONALITY STRIFES IN AUSTRIA-HUNGARY.

Never since the creation of the dual system on which Austria-Hungary rests have the wranglings of the various nationalities of the Empire with each other been so constant and so acrimonious as now. In the Eastern or Transleithan division the mob fury which lately raged against the Jews has largely subsided, owing to strenuous interference and unequivocal declarations on the part of the Government of M. Tisza; and race contention is now mainly confined to the Transylvanian field, where the Saxons feel themselves sorely aggrieved by the school legislation of the Hungarian Parliament, aiming at a gradual Magyarization of all the educational institutions. The Magyars are undaunted in their resolution, and though the Minister of Education, Tréfort, a man of European and chiefly German culture, offers concessions and works for conciliation, the cause of the Germans of the formerly autonomous "Saxonland" seems to be doomed to utter defeat, in spite of the vehement protests and calls for interference raised in their favor in Germany. The Hungarian Government knows well enough that Bismarck is averse to sentimentalism in international affairs, and that he will be as little tempted to deviate from his line of policy toward his ally, Hungary, on account of her lording it over an isolated German "Stamm," as he is to interfere in favor of his less isolated and more grievously oppressed German brethren in the Baltic provinces of Russia. And the spokesmen of the "national" cause at the Parliament of Buda-Pesth have long outgrown the habits of moderation which the leadership of such statesmen as Eötvös or Deák once taught them. The arguments of the defenders of the legal rights of the Transylvanian Saxons remain unheeded, and the accusations of tyranny hurled against the Magyar race from Germany are answered with scorn.

It is, however, chiefly Cisleithania, with its incongruous mass of semi-autonomous provinces, which presents a distressing picture of dissension and strife. Of the central power which once ruled these provinces—in the times of Metternich, Bach, or Schmerling—not a trace remains. Centrifugal tendencies rule the hour. The Federalists have a majority in the Reichsrath, and the administration of Count Taaffe is supported by a coalition based on common, though heterogeneous, hostility to the nationality to which the capital and the court belong—the German. The German party, whose motto was liberal constitutionalism, has been demoralized and almost disintegrated by bad defeats and worse blunders. A vehement pro-Germanism, a Pangermanic patriotism, has taken hold of a portion of the party in the capital. Its manifestations culminated, a few days ago, on occasion of a Wagner celebration, in violent and indecent brawls, in a score of duels with advocates of Austrian principles, and in riotous demonstrations bordering on treason. Bohemia and Moravia are distracted by the old feud between Czechs and Germans, and the recent dissolution of the venerable University of Prague into two rival institutions—one Czechic and one Germanic—which was a triumph of the Slavic party, has, instead of removing animosity, only envenomed it by stimulating the Czechs to further imperious demands in the same direction. Their example and the manifest inclination of the Cisleithan Government, arising from the necessities of its situation and composition, to yield to their demands, embolden the Slovenes of Carniola and Carinthia to press demands of a similar character with turbulent vehemence, while the Dalmatians are conspiring with Croats, Herzegovinians, and Montenegrins for the creation of a Slav realm of the South, and a part of the Triestines are mourning the death of Oberdank, who paid with his life for an attempt to blow up the "Austrian tyrant" of *Italia irredenta*.

More virulent, perhaps, than anywhere else is the strife in the Cisleithan province of Galicia, between Poles and Ruthenes, who, though equally branches of the Slavic race, are divided both nationally and denominationally, the former belonging to the Roman Catholic and the latter to the United Greek persuasion. Both in regard to race and religion the Ruthenes—whose brethren in Russia are known as Malorussians, or Little-Russians—occupy a middle ground between the Catholic Poles and the Orthodox Greek Muscovites, or Great-Russians. As long as Polish patriotism in Galicia was deemed a danger to the integrity of Austria, the organs of the Vienna Government did all in their power to stir up in the rural districts of the eastern half of the province, where the Ruthenes have their seats, sentiments of tribal opposition to the Poles, who predominate in the western half and, through the higher classes, rule the cities. Russia soon availed herself of the nascent dissensions, and, through her tools among the clergy and with the help of secret associations, began an active propaganda among the masses for her own ulterior purposes. This has been kept up till now. But the radical change in the organism and tendencies of Austria wrought by the compromise with Hungary in 1867 has made the Poles masters of the situation in the northeastern province, and they are working with might and main for the permanent establishment and extension of their predominance. On this battleground Polish patriotism and Jesuitism are in a fierce grapple with Panslavism and the organization of St. George. Nihilism tries to glide into both camps, and Dragomanoff, the exiled chief of the "Ukrainophil" party, now in Switzerland, openly works for a reconciliation of Ruthenes and Poles, with the object of revolutionizing all Southern Russia and establishing a Malorussian republic side by side with a Polish.

WASHINGTON IRVING.

Irving's centenary has produced few attempts to estimate critically the strength of the foundations on which his literary fame rests. That he was in his day a very popular writer is a fact that cannot be disputed, any more than can the fact that interest in him has greatly

waned since his death. But this change of itself proves little. The same thing may be said of the reputation of Scott, of Cooper, of Byron, even of so recently famous a writer as Dickens. In Byron's case, the generation now on the stage has witnessed two changes of opinion—one to his disadvantage, and a second, within a few years, toward the rehabilitation of his fame. It is impossible to say how long a period the world will take, in the case of any given writer, to make up its mind as to the permanent position it is willing to accord him; but a hundred years is probably too short a time, and neither in Irving's case nor in that of his rivals or successors is it safe to assume that our present estimate of them will be confirmed by those who come after us.

There is no doubt that the feeling about Irving in this country is still, to a certain extent, affected by considerations which will, as time goes on, lose their influence altogether. He was one of the first of a little band of writers who redeemed this country from the reproach of being without a literature. When he appeared on the scene there was not only no literary class in America, but hardly a belief that the country could produce any. The United States had emancipated itself from English control in politics, but mentally it was still provincial. Cooper, when he began to write, was considered to have done a very sensible thing in taking the materials of his first novel from English society, of which he knew absolutely nothing, and his subsequent innovation of drawing upon America was viewed at first with alarm and distrust by his friends. At the same time it was certain that, could a literature be produced, it would, as the politicians say, be "hailed with delight" by the nascent patriotism of the country. This was Irving's opportunity. His success, when it came, was immense, because he proved to everybody's satisfaction that there really could be American authors.

But Irving did something more than this. He showed, in a certain sense, that there could be such a thing as a New York author—that the local legends and traditions could be used in literature. There were not many of them, but certainly Irving turned them to good account. The history of New York has been for the most part the prosaic and material history of a commercial capital. In our own day we are fond of reproaching it for its materialism; but at the beginning of this century it was far more open to the charge than it is now. Irving himself could do nothing with its history but make a burlesque of it; but in the Hudson and its half-mythical, half-historical associations he found material for the exercise of his imagination and fancy. If the Hudson is to us something more than a mere waterway and convenient natural agency for "moving the crops to tide-water"; if the Catskills are something more than a good place for establishing summer hotels, it is to Irving that the fact is due. If there is a touch of poetry, or romance, or human interest, about the background of New York, a mellow suggestion of myth and superstition, a legendary halo that soothes the sight tortured by the flaring, garish noon of our materialism, it is Irving who put it there. To the world at large, it may make very little difference whether the sketches of which Rip Van Winkle and the legend of Sleepy Hollow are the best remembered, were or were not added to literature; but to a community as scantily supplied with literature as ours, it ought to make a good deal.

Irving's reputation, so far as it rests on this, ought to be entirely discriminated from his repute as an essayist and historical writer. In the latter fields it is quite clear that he had no originality, and that his friends and admirers, had they desired to make sure that oblivion should overtake his fame, could not have set about it in a better way than by holding him up as an American Addison. Irving lived at a time when the old imitative theory of style prevailed, and led young writers to "form" themselves upon acknowledged masters. Franklin, if we remember right, mentions in his autobiography that he prepared himself to communicate with the public in this way. In Irving's case it is difficult to make out how much his similarity to Addison is the result of conscious imitation and how much of inborn literary sympathy. In our day we have pushed the natural theory of style—the theory that it must be a growth, and not a manufactured product—to the opposite extreme, so that our grandfathers' and grandmothers' habit of praising new writers as they appeared for their resemblance to classics strikes us as little less than ludicrous. Possibly we have gone too far. Perhaps we have fostered originality in expression to an excess, as they fostered imitation, until we have confused the grotesque with the original, and given vogue to writers whose chief claim to attention is not what they say, but their saying things in such a queer way.

Irving offended his neighbors and friends by turning into burlesque the Dutch annals of New York; but for this, too, New York owes him a debt of gratitude, for if the city was to redeem itself from the provincialism of its early days and become a great capital, it was absolutely necessary that it should learn to get a proper perspective for its past. Ridicule is the only test by which we get the true measure of the unimportance to the world at large of local celebrity. We are accustomed now to a humorous view of New York, of its society, of its government, of its literature, of its art. It does not offend us, because we are so secure in our position. The Knickerbocker tradition is fair game for all the world. But Irving was a pioneer in this field. The New York of his day was a small provincial town, which thought itself a city, and to make fun of it was a bold thing to do. Irving perceived that the thin stream of provincial history was very slender capital for self-glorification, and refused to connive at the attempt to make grand historical figures out of the phlegmatic, hard-fisted Dutch founders. In this respect he may be regarded as the father of a long line of American humorists who have persisted in exhibiting the reverse of the heroic view of American history and tradition to our generation.

THE RESTORATION OF ST. MARK'S.

FLORENCE, February 22, 1883.

I AM sorry to see Mr. Russell Sturgis joining in the outcry about the recent restoration of St. Mark's, as, in his letter in No. 919 of the *Nation*, he has done.

I went to Venice at the time of a former outcry, some years ago, on this matter, with my mind quite prepared, from what I had seen in the scraping and restoring of the Duomo here, to join in it, and scarify in the columns of the journal I represented the perpetrators of the barbarisms I believed were also being committed at Venice. But before going to work I made the acquaintance of the architect and told him I had come to investigate the charges made against him. He gave me his time, his plans, his personal attendance, his old photographs of the parts restored; he went with me to the cathedral, into the mosaic shops, and never left me until I was satisfied that I knew substantially the merits of the whole question, and he expressed sincere and cordial gratitude for the opportunity I had given him to contradict in the leading English journal the statements made in England about his work. I found him full of the most fervent reverence for the building he had charge of, and utterly removed from any idea that it could be other than injured by the best restoration. He had passed his whole life in the service of St. Mark's—his brother had been the architect before him; and he now for thirty years had been practically responsible for all the reparations. He had a touching regard for every stone which had ever formed part of the church. Such a man is not justly to be identified with the "modern engineer or architect, brought up and taught in the Italy of 1830 to 1860, to whom Palladio was a demigod."

The condition of St. Mark's is not to be measured by that of any other building in the world. It is literally built on mud, and is still slowly sinking into the mud—sinking as a mass and some parts sinking more rapidly than others, so that the piers at the side of the central doorway have gone down twenty or more centimetres more than other parts originally on the same level. In the centre of the church and beneath it is the foundation of the first church, a portion of which, forming the crypt, has been walled in and cemented so that it can resist the pressure of the water which flows and ebbs through the other portion, the sea actually coming up under the central dome of the church. The piers of this subterranean church were probably demolished to the original level of the floor of the actual church; and as the enormous mass of the modern structure goes down into the mud more rapidly than the older, slighter structure, these piers, on which the present floor rests at points, are pushing up the pavement in places, causing those undulations which fanciful people thought were meant to imitate the waves of the sea.

That no adequate foundation for the church was ever prepared may be judged from the fact that the southwest pavilion, which Mr. Sturgis says has been rebuilt, had as a basis piles six feet long, with three feet of loose rubble laid on them as the only preparation for the masonry. As this is the only part of the substructure which has been renewed, we cannot tell how far this example illustrates the whole structure. The material of the church is a very bad friable brick, of which I saw and handled samples which were rubbed easily into dust by the fingers. This was in many places split and opening to the weather—an enormous crack had opened along the vault of the southern aisle, menacing the fall of the whole southern wall, and, although repaired to the best of engineering ability, may still be seen widening slowly over the southern

inner doorway. The outer wall of the Treasury, which bears on its face the façade toward the lagoon, was split within from east to west its whole length through the brickwork, and was gradually approaching a fall, inevitably bringing down as mere débris the entire façade, including the now reconstructed pavilion, and removing the support of the southern wall of the church proper, which is buttressed by the wall of the Treasury, as is that by the southwest pavilion; and the fall of one would, in all probability, have brought down the other. If *then* the piers of the nave would have been competent to bear the new strain and push of the vault of the nave, the domes, and the roof, we cannot say; if not, the nave followed, and all that would have remained standing of the church would have been the north aisle, the wall of which was reconstructed by the Austrians before the present architect had charge of the building. I do not say that the southern aisle *would* have followed the Treasury, or that the nave would have followed that. The latter consequence was possible and the former was most probable, as the great cleft shows any one who will look for it; but the southern wall of the Treasury was doomed, and might have fallen any moment, with whatever effect might be caused by the removal of all external support from the southern wall of the church. The southwest pavilion, which serves as a sort of flying buttress to that corner of the church, was cracked and sinking as the northwest is now, the latter only being kept together by such a number of bolts and iron braces that the disfigurement is very serious.

The marble veneering, which was only about an inch to two inches thick, was so far disintegrated by the sea-damp and frosts that it was in places reduced to a crumbling, amorphous sheet which came off to the touch, and the whole was only kept in place by bolts and hooks and rivets of iron, which in their turn were rusting away with the salt air; and I myself saw large pieces in the portions now under repair which came off in my hand at the least pressure. This veneering was a mere shell of fragments kept there by all sorts of devices until the very wall had to come down. There are plenty of pieces of the veneering still *in situ* which will illustrate what I say, and which, if necessarily removed to-day, would not bear the process of removal without so crumbling that their replacement would be impossible. Moreover, this south façade, being most exposed to the sea, was most attacked. When it was decided to renew the brickwork of this wall every piece of external marble which would hold together was carefully put away—the veneering was necessarily condemned. When the masonry was opened, it was found that the builders had used to fill up and bind the central portions of the piers, etc., quantities of fire-wood, which answered as strengthening material for a time, but became dust finally and left a void.

The brickwork reconstructed, every fragment of the ornamentation of the façade and pavilion, every piece of sculptured stone, with the exception of one or two of the minor capitals in the upper tier, was replaced, one of them being in seven pieces and requiring to be held together by bolts to be kept in its place. Every column went back to its place, only the sea side being turned inward to show the side which had not suffered from the damp so much. Not one piece of sculptured stone (except the small capitals mentioned) has been lost, rejected, or left out of its original place. To prove this it is only necessary to examine the stones as I did, and compare the photograph of the façade before the restoration with that made since. Mr. Sturgis says that "none of the numerous commentators upon these restorations have denied the haste and recklessness of the demolition." I declare, confident in my ability to maintain it to any fair-minded body of men who will look into the evidence shown me, that nothing better than was done could have been done—*with one exception*. In this sinking process of the church, the cornice of the portico façade (front of the church) had taken a wavy line which was curious and told the story of the church—going down by slow degrees into the mud which had been the foundation and greatness of Venice. There was a pathetic motion indicated by this wavy line which need not have been corrected, and the architect brought it into line as far as he restored, and so broke this curved front, so bad architecturally, but so picturesque and pathetic that I should like to have preserved it.

Mr. Sturgis intimates that a change has taken place in the direction, and that in future a different course will be followed from that which he has condemned; but I am assured, on the contrary, that the plans for the restoration of the whole portico façade were prepared years ago, are still approved by the authorities responsible, and will be followed out exactly to the end, as they really were made, on the basis of doing what was necessary to prevent what is worse even than restoration, and only doing it as it became necessary. The repairs of the south flank became imperative to prevent the building falling; those on the southernmost doorway of the front were made in my own knowledge, and the veneer of marble was in some places so broken and disintegrated that there was no process by which it could be restored to its place. The under brickwork was decayed away from the columns, leaving them in some places detached, and they had for years been kept up by balks and braces of timber and iron, more disfiguring to the church than repairs. As I have said of the south flank, so of the doorway—every fragment of sculptured work was preserved and carefully restored to its exact place; the columns not repolished, but merely turned round. As for the thin slabs of veneer (absolutely the only new material visible), they could not be replaced, nor could they be always renewed in the same kind, for where the original was in verde antique the nearest approach to it that could be found was the Genoa green, the locality of the verde-antique quarries being now unknown; the Venetian supplies were taken from ancient temples. When, as in the gray marble, the material is Italian, it has been renewed with the same, no possible pains to replace the old by a similar new material having been spared. In short, I found that there was no foundation for a single one of the terrible accounts of barbarism and neglect which were told me by outsiders, antiquaries, and artists, who hate the restorations because they look new—as if any method existed, except that of time, of harmonizing new stone with old. One antiquary, indeed, had a process of rubbing all the new marbles with lead to provoke a more rapid discoloration.

But the gravest part of Mr. Sturgis's charge—viz., that concerning the mosaics—I am in a position to contradict by the evidence of my own eyes, for I saw the restorations being made. The facts are these. The wall of the Treasury was in many places cracked and cracking, the fissures extending with the settling of the masonry. At all these fissures the humidity attacked the "mastic" which held the cubes of mosaic in their places, so that there was a disintegration going on of the whole work, slowly extending from every fissure; and this had been going on for years, the floor being at any time covered with the little cubes which dropped down. So long as the decay on the walls was going on, it was manifestly useless to fill up the crevices in the mosaic; but once the walls had been so repaired that no further cracking was to be feared, the mosaics were put under repair. Careful tracings were made of every portion attacked, and these were used in the preparation of colored drawings in which the cubes of glass were all reproduced with a care which was absolutely unsurpassable. These memoranda prepared, the cement was cut away as far as it was decomposed and endangered the fall of the cubes, and then the cracks were filled up and the mosaic restored according to the drawings, as far as these went; but there were many vacant places in these drawings, due to the destruction of the mosaic along the cracks and the space created by the cracks themselves. These had to be filled up in the only possible way, by the judgment of the most experienced mosaic workers following the adjoining work. Not one fragment of the work which was firm on the wall was touched, and many people, unable to perceive that there has been any alteration, abuse the whole as an entire restoration. I certainly, standing on the platform by the side of the workmen, could scarcely find the line between the old and the repairs in many places. Compare this, which I give as my own direct testimony, with the reports which Mr. Sturgis heard and says "all agree to"—viz., "that the mosaics of these two apartments (Zeno Chapel and Bapistery), both walls and vaults, were torn down with pick-axes and without attempts to preserve even parts of them." The floor of the church, again, with its billowy insecurity to the visitor, although beyond question the result of a bad construction, is left undisturbed; but the portion of the flooring of the south aisle nearest the transept was in utter decay, the cubes loosened or worn out, and the pattern quite gone and indistinguishable. The restorers, therefore, took up the corresponding portion on the north aisle, without any change whatever, carried it bodily over to the south side, and relaid it, replacing it on the north side by a new copy of the old as close as possible to the original, but made of cubes five times as deep.

At least in one instance, Mr. Sturgis says, sections of mouldings have been changed, "as if the old work had been plucked down and carted off, etc." This must, I imagine, apply to the only change made in the south side—*i. e.*, in the little easternmost window. The change here was made back to the original moulding, of which traces remain in the window which had been altered in the sixteenth century. The tomb which stood in the middle of this wall was a late and ugly one, and of no importance, so it was simply left out in the restoration. What was there originally, there is nothing to show.

I have written at great length; but I should not be a friend of justice if I did not bear my most energetic and prompt testimony in favor of the authorities in charge of St. Mark's, who deserve all credit for their work, and their reverent manner of doing what we all regret the necessity of having done. W. J. Stillman.

P. S.—The present restorations have lately brought to light the fact that repairs are not merely the work of our time. An inscription brought from Crete, and relating to the alliance of two chief Cretan cities, which was known and incorrectly transcribed 200 years ago and then lost to all search, has just been found built into the façade of the portico.

Correspondence.

THE REASON WHY.

To the Editor of The Nation:

Sir: You say that you cannot make any other explanation of B. F. Butler's election than that of a political debauch on the part of the people of the State. As I am jealous of the

reputation of the people of Massachusetts, and believe that when any considerable number of them agree upon a thing, they have a reason for it, I desire, with your permission, to state what I believe to be the reason in this case.

The political history of Massachusetts, like that of every other State and city in the Union, turns upon a process by which the Legislature has reduced the Executive to insignificance. In Massachusetts it has surrounded him with a council without whose permission he can hardly go out of doors. It has deprived him of all share in directing the government, except a simple aye or no as to whatever the Legislature may put before him. It has made all the chief executive officers separately elective by the people, and thus wholly independent of the Governor and of each other. But as administration in this way is wholly impossible, the Legislature proceeded to set up a secondary executive in the shape of a number of commissions, still independent of each other, whose policy and pay are provided by the Legislature, the nomination of the members being left to the Governor, so that the appearance of responsibility may rest upon him. These commissions work absolutely in the dark, the public hardly knowing their names; and of course that which is unknown easily becomes an object of suspicion.

In this state of things, the Republican party nominated Mr. Bishop, a man of the highest character, but whose name had no more meaning for the State than a text of Sanscrit. With such a candidate, and no policy, enthusiasm in the ranks was hardly to be expected. On the other side appeared a man who declared this government by commissions to be all wrong, and that if he was elected he would set it right. Grant, if you please, that 90,000 Democrats voted for him partly from discipline, and partly because he is a vulgar blackguard, and 20,000 Republicans because they longed for some change from the meaningless monotony of recent years, yet he was really elected by the large number of Republicans who, while they would not vote for him, were yet so disgusted with the empty farce which had been called politics that they refrained from voting at all.

Governor Butler has so far kept his promises that he has got into a violent quarrel with the Legislature, conducted in his peculiar manner. With a cynical defiance of opinion, he leaves his post and goes off to try cases at Washington. It seems as if his downfall were certain. But there is another danger to be reckoned with. Our people are apparently unable to understand that the world always has been, and always will be, governed by *men*. You cannot arouse enthusiasm in multitudes about measures which involve complex details, but you can do so about men. And so, while the virtuous are proceeding solemnly with their "platforms" and their "theory of our institutions," the rascals lay hold of human nature by setting up men. The remedy lies in appealing to the better part of the country on behalf of legitimate power and responsibility in individuals, and stronger administration. The logical and inevitable outcome of this legislative anarchy, unless corrected, is civil war—not immediately or suddenly, but by slow gradations of faction and disintegration. The election of Butler is an unmistakable symptom, and if he and his fellows are keen enough to follow up the scent they have struck, it may become a very serious one. G. B.

Boston, March 31, 1883.

WHITTIER AND CLAY.

To the Editor of The Nation:

Sir: In a notice of Kennedy's 'Whittier,' in the *Nation* of March 15, you speak of "such characteristic and, in the main, such beautiful and elevated poems as those preserving the traits of Mr. Whittier's contemporaries—the Calhoun, Webster, Silas Wright, Garrison, Follen, Channing, Shipley, Pierpont, Leggett, Storrs, Torrey, Neall, of the earlier period; the Sumner, . . . Joseph Sturge, of the later." How is it that the name of Clay does not appear in this galaxy? Is it because the highly (some would say extravagantly) laudatory sentiments of the poem "preserving the traits" of the Western statesman contrast so strangely with the wail of the poet, sixteen years later, over the "dead fame" of his Eastern contemporary?

"So fallen, so lost," begins the latter.

> "Not fallen: no, as soon the tall
> And pillared Alleghanies fall,"

is the indignant outburst of the former against the exultation of a political antagonist over the fall, never to rise again (so he thought it), of the Whig leader in the conflict of 1832. And, further on:

> "Star of the West, a million eyes
> Are turning gladly unto him;
> The shrine of old idolatries
> Before his kindling light grows dim."

I am not sure of the adverb in the second line, for I quote from memory; it may have been *fondly* or *proudly*. I found the whole poem, while sojourning in Illinois in 1841, in a stray copy of a Chicago newspaper, in which it was represented as written of Benton! Returning to the East the following year, I called on the poet, whose acquaintance I had had the pleasure of making the year before, while temporarily in charge of St. James's Church, Amesbury, and asked him about it. He said, as I had no doubt he would, that it was written of Clay; but, he added, "the sentiments are not my present ones." Even at that early period he had cast in his lot with Garrison and the handful of doctrinaires that sided with him. Garrison himself had had a similar experience: witness the lines addressed by him (see Cheever's 'Common-Place Book of American Poetry') to Senator Frelinghuysen some years earlier, winding up with

> "How could we bear resignedly thy loss?"

E. J. Stearns.

Faulkland, Del., March 28, 1883.

BYRON AND THE CHORAGIC MONUMENT OF LYSIKRATES.

To the Editor of The Nation:

Sir: The reviewer of Boetticher's 'Olympia,' in your issue of March 15, accuses his author of making a slip "when he speaks of the choragic monument of Lysikrates, a windowless building some six feet in diameter, as having been Lord Byron's 'Wohnzimmer' when he was in Athens." I do not know Boetticher's authority for the statement, unless it be the familiar tradition at Athens, where many remember the monument as it appeared when built into the southeast angle of a French Capuchin monastery, now destroyed; but in Dodwell's 'Classical and Topographical Tour through Greece,' opposite page 289 of vol. i., a steel engraving of the habitable room formed by the monument, as it appeared at the time of Dodwell's stay (1805), will be found. In the text he says:

"The choragic monument of Lysikrates, which is partly immured in the southeast angle of the convent, is so well known, and has been so fully described by Stuart, that little can be added to what has been already published upon that subject. . . . The upper part of this monument is hollow, and contains a space of nearly six feet diameter, which is at present the library of the superior of the convent. . . . I was assured by the superior that during the dilapidating mania in 1801 proposals had been made to him and to the Voivode for the purchase of the entire monument, which was to have been conveyed to a northern country, and that it owes its present existence to the protection which it derived from its position within the precincts of the monastery."

The cut shows the prior at his desk in the interior of the alcove room formed by the monument, which is accessible by an open doorway in its side, and lighted by a window in its street-wall.

In Nichol's 'Byron,' page 64, the poet is rather vaguely said, in 1811, to have "studied Romaic in a Franciscan monastery." His own 'Hints from Horace' is dated "Athens, Capuchin Convent, March 12th, 1811."

Alfred Emerson.

Johns Hopkins University, Baltimore, March 23, 1883.

IRISH AND GAELIC.

To the Editor of The Nation:

Sir: On reading a review of the 'Imperial Dictionary,' in your number for March 29, I was reminded, from its repetition in the "Imperial," of a curious philological error which appears in "Webster" and "Worcester." Your reviewer quotes a certain definition from the "Imperial," containing, among other etymologies, this one: "Ir. and Gael. *apa*." Here "Ir." evidently stands for "Irish," so that a person not knowing better would be led to suppose that there is an "Irish" language *and* a "Gaelic" language. Bayard Taylor also, describing a trip from Belfast to Glasgow, evidently distinguished two languages when he mentioned Scotch deck-hands as talking "Gaelic," and on the same page referred to Irish harvest-hands as talking "Irish." The mistake is common enough, but it ought not to occur in a dictionary that professes to trace etymologies. I am not a Celt, yet I cannot help a feeling of astonishment that such vague or erroneous notions of the language that once held sway over all the West of Europe should prevail among people interested even to a slight degree in philological studies.

Now, the fact is, this so-called "Irish" is Gaelic *par excellence;* it is the purest form of Gaelic. It is true that a phonetic system of spelling was adopted in Scotland in the last century to take the place of the ancient, but more cumbrous, system to which the Irish still adhere; and it is also true that the Scotch, and the Irish too, have some unimportant dialectical variations of their own. But the language of the Celts of Ireland and Scotland is one language substantially, *when spoken*, and that language is *Gaoidhilg*—phonetically written, *Gaelic*. If the makers of these dictionaries, who apparently have no acquaintance with Gaelic in any form, must distinguish, where practically there is no distinction, why not distinguish as "Irish-Gaelic" and "Scotch-Gaelic"?

T. F. Galwey.

New York, March 30, 1883.

[The following extract from Mr. Skeat's "Brief Notes" upon the languages cited in his 'Etymological Dictionary of the English Language' contains the necessary comment on the above: "'Celtic' is merely a general term, and in itself means nothing definite, just as 'Teutonic' and 'Romance' are general terms. To prove that a word is Celtic, we must first show that the word is borrowed from *one of the Celtic languages, as Irish, Gaelic, Welsh, Cornish, or Breton*," etc.—Ed. Nation.]

Notes.

FIVE years ago Messrs. R. M. Johnston and Wm. Hand Browne published, through J. B. Lippincott & Co., an authorized life of the late (then living) Alexander H. Stephens. For this they are now preparing a supplementary chapter to cover the close of Mr. Stephens's career, and they call the public's attention to the fact that other biographies, announced since his death, must inevitably be of a kind which he strenuously deprecated.

Thomas Whittaker has nearly ready 'Stories from English History,' by Louise Creighton, with quaint illustrations from old prints, frescoes, etc.

The following are the principal spring announcements of the Boston publishers: *J. R. Osgood & Co.*:—A 'Life of H. W. Longfellow,' by his brother, the Rev. Samuel Longfellow; a 'Life of Nathaniel Hawthorne,' by Julian Hawthorne; Mrs. Burnett's 'Through One Administration,' and Mrs. Mary Hallock Foote's 'The Led Horse Claim.' *Houghton, Mifflin & Co.*:—A 'Life of Daniel Webster,' by Henry Cabot Lodge, in the "American Statesmen" series; a large-paper edition of Emerson's works, from new electrotype plates; a new edition of the poems of Jones Very; 'Ten Great Religions,' Part 2, by the Rev. James Freeman Clarke; 'The Freedom of Faith,' by the Rev. T. T. Munger; 'The Quaker Invasion of Massachusetts,' by Richard P. Hallowell; 'From Ponkapog to Pesth,' by T. B. Aldrich; and 'But Yet a Woman,' by Prof. A. S. Hardy, of Dartmouth College. *Lee & Shepard*:—'Travels and Observations in the Orient,' by ex-Gov. Walter Harriman, of New Hampshire; a 'Life of Longfellow,' by Dr. G. L. Austin and John Owen; and the second and concluding volume of Dr. Coues's 'Bird Life.' *D. Lothrop & Co.*:—'The Imagination, and Other Essays,' by George Macdonald. *Roberts Bros.*:—'Living English Poets'; 'Thirlwall's Letters to a Friend,' with additions to the English collection; and 'Early Christianity,' being the first part of a work entitled 'Christian History in its Three Great Periods,' by the Rev. Joseph Henry Allen. *S. E. Cassino & Co.*:—'The History and Uses of Limestones and Marbles,' by S. W. Burnham; a 'Handbook of Entomology,' by Prof. Charles V. Riley; a 'Manual of Taxidermy, for Beginners,' by C. J. Maynard; 'Letters of Indian Travel,' by Prof. Ernst Haeckel; and 'Oliver Wendell Holmes as Poet and Scientist,' by Wm. Sloane Kennedy.

The New York announcements are as follows: *Robert Carter & Bros.*:—A 'Life of Robert Moffat,' the African Missionary, father-in-law of Dr. Livingstone. *T. Y. Crowell & Co.*:—A 'Dictionary of Poetical Quotations,' based on H. G. Bohn's. *Dodd, Mead & Co.*:—'Selections from the Poetry of Robert Browning,' with an introduction by Richard Grant White. *Fords, Howard & Hulbert*:—'Books and How to Use Them,' by John C. Van Dyke; 'The Housekeeper's Year-book,' by Helen Campbell; and Judge Tourgée's 'Hot Ploughshares.' *Henry Holt & Co.*:—A 'History of the United States,' by Alexander Johnston; 'Outlines of the Constitutional History of the United States,' by L. H. Porter; Paul Lacombe's 'History of France,' of which we have had but a poor translation hitherto; E. A. Freeman's 'Impressions of America'; 'Early Law and Customs,' by Sir H. S. Maine; 'The Human Body,' by Prof. H. H. Martin; 'Botany,' by Prof. George Maclerkie, and a briefer work on the same subject by C. E. Bessey; 'Folk Etymology,' by the Rev. A. Smythe Palmer—a dictionary of verbal corruptions and perversions of words; Jean Paul Richter's 'Invisible Lodge,' translated by the Rev. C. T. Brooks; 'Classic Mythology,' by Prof. C. Witt, and 'What Shall We Act?' by M. E. James. *W. R. Jenkins*:—'Le Voyage de M. Perrichon,' by MM. Labiche and Martin, being the first of a "Théâtre Contemporain," selected from the best modern French plays, and guaranteed fit for school use or general reading. *Macmillan & Co.*:—'Some of Æsop's Fables, with Modern Instances,' designed by Randolph Caldecott; a 'Life of G. F. Handel,' by W. S. Rockstro; 'Philip and James van Artevelde,' by W. J. Ashley; 'Caucasian Experiences,' by Yuz Bashi; and 'Investigations in Currency and Finance,' and 'Methods of Social Reform, and Other Essays,' both by the late W. S. Jevons. *Scribner & Welford*:—'Memoirs of the Court and Family of Napoleon,' by Mme. Junot; 'Mexico To-day,' by T. U. Brocklehurst, and 'People I Have Met,' by E. C. Grenville-Murray.

To the foregoing should be added: *Warren F. Draper* (Andover, Mass.):—'The Hebrews and the Red Sea,' by Alexander W. Thayer. *Fergus Printing Co.* (Chicago):—A 'Pioneer History of Illinois,' by the late Gov. John Reynolds—a reprint with corrections and notes. *Townsend MacCoun* (Chicago):—'The British Constitution,' by Amos Dean, a posthumous work; and a 'History of Pianoforte Music,' by J. C. Fillmore. *J. B. Lippincott & Co.* (Philadelphia):—'The Wisdom, Poetry, and Pathos selected from the Works of Ouida,' by the Rev. F. Sidney Morris; and 'The Miracles of the Saints,' by E. Cobham Brewer.

Funk & Wagnalls have issued the second volume of the Schaff-Herzog 'Encyclopædia of Religious Knowledge' (Gabbatha-Ozanam), of which the first volume was reviewed at length in these columns.

Mr. Howells's 'Sleeping-Car Farce,' which so enlivened *Harper's Christmas*, has been republished in pocket-shape by J. R. Osgood & Co., and is now available for home amusement by amateur performers.

Mr. Henry James's 'Daisy Miller,' 'An International Episode,' 'The Diary of a Man of Fifty,' and 'A Bundle of Letters,' make No. 303 of Harper's Franklin Square Library.

The twenty-four days' proceedings last summer at the Concord School of Philosophy are given in abstracts, approved by the several speakers, in 'Concord Lectures on Philosophy' (Cambridge: Moses King). An historical sketch of the foundation of the School, with a summary of the courses of the three previous years, is prefixed; and biographical notes convey considerable information concerning the philosophers who held forth in 1882.

The annual report of the State Geologist of New Jersey for 1882 is one of the most interesting of a series always instructive, and for the most part level with the popular comprehension. Professor Cook devotes himself particularly to a discussion of the sandstone region, with great thoroughness and detail, supplying numerous lithographic illustrations from original photographs of rock exposures. There is also a section on the clay product, which furnishes 80 per cent. of the architectural terracotta made in the United States, a new industry in fire-proof "terracotta lumber" having sprung up which leaves no excuse for death-traps in our great cities. The seaside developments are attractively described, and a surprising list of them from the Highlands to Cape May prepares one to trust Professor Cook's prediction that their further multiplication involves an ultimately continuous line of *beach* railways between the points named, thus affording "one of the grandest railway rides on the continent." Already "there is not a point on the coast line more than ten miles by navigable waters from a railroad station." The agricultural prospects of the southern part of New Jersey brighten yearly. Its climatic advantages are also rapidly becoming appreciated. Cotton and sugar-cane are profitably cultivated in Cape May County, whose winter temperature corresponds to that of West Virginia and western North Carolina and Georgia, while its climate is more even than theirs. Large space in this Report is given to water supply and drainage, the basins of the State being indicated on a small map. The large colored geological map, with additions and emendations, accompanies the Report as usual.

The first (April) number of the *Interchange*, published by Howard Challen, Philadelphia, is before us—nine octavo pages in double columns, giving the contents of leading periodicals, notes on current periodicals, and book notices: a beginning which will be improved upon, doubtless, in subsequent issues.

The April *Wheelman*, Boston, begins a second volume. The tasteful cover, the numerous illustrations, of good quality, and the text itself, rank this among the most attractive of the monthly magazines. The bound volume i. makes a very handsome appearance, and has a permanent usefulness in its descriptions of bicycling tours by which the adventurous may be guided.

With the February issue the *Bollettino* of the Italian African Society entered upon its second year. It promises at least a quarterly appearance hereafter.

An Alsatian photographer, M. Meyer, says the March *Polybiblion*, is about to employ his art in preparing an Alsatian iconography, for which distinguished subjects abound. Some of the portraits to be thus reproduced are great rarities; but M. Meyer will also take account of living celebrities. The late M. Stoffel was engaged, at the time of his death, upon a 'Dictionary of Alsatian Biography.'

The rubbishy 'Hypnerotomachia Poliphili,' which has just been literally translated for the first time ('Le Songe de Poliphile,' version of Claudius Popelin, Paris: Isidore Liseux), is summarized, with numerous illustrations, in *Le Livre* for March. But by far the prime attraction of this number is the opening tribute of M. A. Quantin to his fellow-publisher, M. Alfred Mame, head of the great establishment at Tours—a model establishment for the world, one may safely say. M. Mame's enterprise, his pride in his art, his typographic masterpieces, his magnificent business, his care for his employees, his benevolent foundations, are set forth in a way to command universal respect and esteem for so fine a character. An etched portrait of M. Mame shows a countenance in full accord with the good that is related of him. We commend M. Quantin's article to every American publisher who takes a philanthropic interest in his calling.

We have been puzzled by the ante-dating, post-dating, and non-dating of books. A European novelty in this field is the double-dating instituted—unless others wish to claim priority—by the publisher of the eminently respectable series of "Deutsche Zeit- und Streit-Fragen" and "Sammlung gemeinverständlicher wissenschaftlicher Vorträge" (Berlin: Carl Habel). Franz von Löher's 'Das neue Italien' (No. 175 of the former series), and Dr. M. Alsberg's 'Die gesunde Wohnung' (No. 407 of the latter), which are before us, both bear "1883" on the cover, while the title page gives "1882" as the date of publication (or delivery of the "Vortrag"?). There is certainly no deception intended in this case, but the practice is nevertheless reprehensible and misleading, as we have experienced in the reference in Herr von Löher's pamphlet to the 16th of July, "two years ago."

Announcement has already been made of the

illustrations to Poe's "Raven" made by Gustave Doré, and shortly to be published by Harper & Bros., with a preface by Mr. Stedman. We should think that some American publisher would also find his account in bringing out an edition of the very curious designs made for the same poem by another French painter, the impressionist Édouard Manet—designs at once mystic and realistic. Next to Cooper, Poe is perhaps the best known in France of all American writers, and we have had occasion recently to see a French edition—undated, but probably not old—of one of his most characteristic tales, 'The Thousand and Second Night,' freely turned into French, and illustrated by quaint and characteristic drawings by the late André Gill.

Mr. Kurtz's 'Illustrated Art Notes' for the fifty-eighth Spring Exhibition of the National Academy of Design has promptly made its appearance (Cassell & Co.). Excellent features of the present issue are the biographical summaries appended to each contributor's name, and diagrams showing the position of each picture as actually hung upon the walls of the Academy.

One of the pleasantest pieces of Italian news is that relating to the Corsini Palace in Rome. The Government decided to purchase it, and make of it a *palazzo delle scienze*—a sort of Roman Somerset House. Depretis, with the Minister of Education, Torlonia (the Roman syndic), the presidents of the *lincei* and other scientific societies, met with Prince Corsini to complete the contract. The terms included the palace, with all the land adjoining as far as the Janiculum, the price paid being $625,000. After the papers had been signed, the Prince informed the assembled parties that he made a gift to the new establishment of the Corsinian library and gallery of pictures—both of great value.

Mr. Stillman's letter on another page, defending the restorations of St. Mark's Church, Venice, will doubtless lead some of our readers to turn back to the communication of Mr. Sturgis with which issue is taken. We believe that, for the purpose of understanding and reaching an intelligent conclusion in a controversy which in English circles has been attended with much heat, no better material exists than these two letters afford. This is no slight recommendation, considering the small library of pros and cons in pamphlets and articles in periodicals which an exhaustive study—not of the facts, but of the arguments and epithets—would require one to examine.

—The sale of a library described by the London *Times* as having been "originally formed by the famous Admiral Sir Francis Drake, and added to from time to time by his descendants," took place in London on the 11th of March and three following days. The *Times* says that "many of these books and old tracts were, no doubt, collected by the great Admiral, especially those very scarce tracts of the early seventeenth century relating to the English voyages to America"; and it instances Rosier's 'True Relation' as certainly one of "those identical ones which Drake had preserved at the time of their publication." To say that Drake died in 1596, and that Rosier's tract was not printed until 1605, is to question the accuracy of the *Times's* statement; and if we were inclined to be particular, we might ask how it happened that Sir Francis's "descendants" could have any hand in the collection of the library, seeing that the histories put it down that Sir Francis himself "left no posterity." The books, however, by whomsoever collected, were veritable nuggets, and grand prices were bid for them at the auction. Rosier's 'True Relation of the most prosperous voyage made this present yeere 1605 by Captain George Waymouth in the discovery of the land of Virginia,' a tract of only twenty leaves, and unbound, went for £301 to Mr. Bernard Quaritch. A copy of this rare tract, elegantly bound, was in the Brinley sale (No. 280), where it fetched no more than $800. And some years further back the sale of a copy is recorded (Inglis sale) at nine guineas, the work going to the British Museum. Mr. Quaritch also secured Hariot's 'Briefe and True Report of the New Found Land of Virginia,' London, 1588, a work of which only two other copies are known—one in the British Museum, the other in the Bodleian; £300 was the closing bid for this precious volume. 'Newes from Virginia' (six leaves), by R. Rich, London, 1610, brought £93; 'Good Newes from Virginia,' by A. Whitaker, London, 1613, £90; 'Good Speed to Virginia,' by R. G., London, 1609, £30; and 'True Declaration of the Estate of the Colonie of Virginia, with a confutation of scandalous reports,' etc., London, 1610, £80. For all the works relating to America large prices were paid; and as among the buyers we notice the names of Mr. B. Quaritch, H. Stevens, and Ellis & White, gentlemen who buy largely "upon orders," it is not unlikely that some of their purchases will find their way to this country.

—Lovers of Old-English literature in this country ought not to let the death of Mr. William G. Medlicott, of Longmeadow, Mass., pass without a word of commemoration, if only to remind the world how rare an example he afforded, and how worthy of imitation it ought to be by those situated as he was. It was Mr. Medlicott's good fortune to possess one of the best collections of Anglo-Saxon and Early-English books in this country, among them volumes which had belonged to celebrated men—to Sir Frederick Mad den, Thorpe, Conybeare, Cockayne—and which were enriched by their MS. notes, with numerous and rare editions of 'Beowulf,' Cædmon, etc. But what was more uncommon was the generous and enlightened spirit with which this collection was placed at the disposal of scholars and specialists working in the field of Anglo-Saxon. Mr. Medlicott freely lent his books, often sending them at considerable risk to great distances, and leaving them in the hands of borrowers for months together. Such liberality in this epoch of jealously-guarded libraries deserves appreciative mention.

—A number of theological handbooks are upon our table. First is the Oxford 'Parallel New Testament, Greek and English.' This handsome volume presents side by side the Authorized Version of 1611 and the Revised Version of 1881, each with its marginal notes, and the Greek text as adopted by the Revisers; the displaced readings being preserved in the margin among the notes proper. The work also contains the Revisers' preface and the translations preferred by the American Committee, and thus leaves nothing to be desired as regards the body of the New Testament. Next in order are two concordances to the Revised Version—the 'Complete Concordance,' by John Alexander Thoms (Chas. Scribner's Sons), and the 'Students' Concordance' (D. Appleton & Co.). Like the Parallel Testament just mentioned, Mr. Thoms's Concordance is published under the joint authorization of Oxford and Cambridge Universities. It includes the more important marginal readings of the English and American Revisers. The 'Students' Concordance' is anonymous, but is the work of several hands (English). Its typography is the more inviting of the two and the easier for reference, but its references are less complete than Mr. Thoms's. For instance, under *belly*, the latter gives three more texts, one of which, to be sure, is the preferred American, but the other two are to be found in the 'Students' Concordance' under other words in the same connection. Mr. Thoms has sixteen entries under the pronoun *I*, which the rival concordance takes no account of. He, again, inserts proper names in the main alphabet, which is certainly better than to group them by themselves. A fourth volume is Dr. John F. Hurst's 'Bibliotheca Theologica: a Select and Classified Bibliography of Theology and General Religious Literature' (Scribners). This very intelligent and conscientious guide cannot fail to be of great usefulness to the students, ministers, and teachers for whom it was designed. Bibliographically, it is sufficiently minute, giving the size of each book, the number of pages, the edition, the publisher's name, and the date. It is liberal in its inclusiveness, admitting Unitarians and Universalists to the equal company of the evangelical denominations, as a glance at the title "Sermons" will show. It has two excellent indexes, of authors and subjects, and is beautifully printed.

—Among the contributions to the fifteenth volume of the 'Encyclopædia Britannica,' ninth edition (Boston: Little, Brown & Co.; New York: Charles Scribner's Sons), two have the dimensions of good-sized volumes: "Mammalia," by Professor Flower, and "Mechanics," by Professor Tait. "Magnetism," by Professor Chrystal; "Measurement," by R. S. Ball; and "Medicine," by Drs. Creighton and Payne, are also extensive scientific articles. Geography and history are treated in notices of generally moderate dimensions and little attractiveness, the geographical ones—like the notices of Louisiana, the Isle of Man, Manchester, and Maryland—being often particularly remarkable for dryness, while many an interesting title, such as Lusitania or Lützen, is forgotten. Among the more valuable contributions of this class are Rev. A. H. Sayce's "Lydia," Rev. C. W. Boase's "Macedonian Empire," Rev. J. Sibree's "Madagascar," and Professor Robertson Smith's "Mecca" and "Medina." This scholar has also a good article on Malachi, while Professor Harnack discourses learnedly on Mark, Marcion, and Manichæism, the Rev. J. Sutherland Black on the Virgin Mary, and Professor Kessler on the Mandæans. Too brief and in every way inadequate are the articles on the Books of Maccabees and the Maronites, and unnecessarily bristling with titles, references, and foot-notes are Dr. Schiller-Szinessy's "Mahzor" and "Maimonides," the Hebrew of which—including such words as "siphethe," "hilekhoth," "dibere"—is not without flaws. The latter article is almost purely bibliographical, and the *life* of its interesting subject is all but completely forgotten. Incomparably more attractive lives of authors are those of Lotze (by Merz), Lucian (F. A. Paley), Lucretius (Professor Sellar), Macaulay (Rev. M. Pattison), and Machiavelli (Symonds). Professor Lindsay contributes the life of Luther, Gairdner that of Mary Tudor, Swinburne a much longer biography of Mary Stuart, and Professor Villari a connected series of sketches of the Medici family in Tuscany. The French queen Marie de Médicis, however, is forgotten, and so are Marie Louise, Maria Christina of Spain, Maria da Gloria of Portugal, and Mary Magdalene.

—The manner in which many of the biographical sketches of the 'Britannica'—in this volume as in others—open is almost amusing. One of them begins thus: "Lysimachus, son of Agathocles, a Thessalian in the service of Philip of Macedon, was born about 361 B. C. During Alexander's campaigns he was one of his immediate bodyguard. . . ." That the subject of the article is not Philip's Thessalian, but the Thessalian's son, there is nothing in the context

to indicate, and we must read on to find out that we have been so unceremoniously introduced to a famous commander and King of Thrace. Another opening runs thus: "Mandeville, Bernard de (1670–1733), is generally known as an ethical writer of debasing and degrading tendency, but he was at least as much of a humorist as a philosopher, and set up as an analyst of 'what is,' repeatedly disavowing all pretensions as a lawgiver of 'what ought to be.' He was a foreigner by birth, a native of Rotterdam. . . ." This is a rushing *in medias res*, or rather *in ultimas res*, before giving the plainest information to the common reader—as, for instance, *where* Bernard de . . . was a foreigner. Under "Luther," we read of a "First Period (1483–1517)" before reading the name of Martin. These are, however, trifling irregularities, in no way impairing the value of the biographical notices. The greatest defectiveness of the 'Britannica's' biography shows itself in the dynastic portions —excepting the English—and nowhere so glaringly as in this volume under "Louis." The histories of the various countries are generally referred to as almost completely covering the lives of the monarchs, and the notices of the latter mostly present but a few details as to parentage, age, marriage, etc. The reference is, however, always in great part, if not almost completely, deceptive; for, as a rule, the general history of the country tells of the reign, but ignores the prince's personal life and characteristics. The eighteen French Louises are despatched in two pages—St. Louis receiving four lines and a reference to "France"; Louis XVI. five lines and a reference; and Louis XVII. six lines without a reference. Not much more space is allotted to Maria Theresa, though "the events of her reign have been [but] briefly summarized under AUSTRIA and HUNGARY," or to Matthias Corvinus, though only "the leading events of his reign are summarized in the article HUNGARY."

—The method of Mr. Green, of Worcester, Mass., of making the public library a help to the schools by what might be called a course of library lectures—conferences between the librarian and the scholars, at the library, in which they learn what can be done there and how to do it —in which some of them apparently learn for the first time that there is a library—this practice, we say, is slowly spreading. Some small libraries, then Cincinnati, and now Chicago, have adopted it. At Chicago the teachers have fallen in with it readily, and the Saturday mornings have been engaged for weeks ahead. No doubt it will become more and more common, and will succeed wherever the librarian has the faculty of catching the attention of young people. It is an increase of his work—one more added to the long list of qualifications of the perfect librarian, which, as drawn up by the Abbé Cotton des Houssayes and others, is already sufficient to make a bold man hesitate before accepting the place. Knowledge of all languages, familiarity with all sciences, a natural aptitude for classifying, familiarity with and manual skill in all the book-preserving arts, perfect command of temper with the impertinent and overbearing, unwearied patience with the stupid and the ignorant and the scatter-brained, quickness of thought to be able to answer the man who has not a minute to spare, plodding perseverance in the service of those who are searching for a needle in a haystack—these qualities have always been expected of him. Now, it seems, he is to add to his learning the power to impart it, and not only to be able to help those who want to know, but to instill the very desire for knowledge. It is not every one who can do this, and it would be well for the general success of the experiment if librarians who have not the tongue of a ready speaker should depute this part of their work to more fortunate assistants. Some years ago much was said at librarians' conventions and written in the newspapers about professorships of bibliography, with reference chiefly to colleges; the idea being that instruction in the use of books for study and investigation should be given by college librarians to the students. Not much appears to have come of the talk; most of our college libraries, so far as we know, are conducted in the same way as before, with very little effort to train the students in what should be called not so much bibliography (description of books) as bibliochresis (use of books). But the idea has taken root lower down. The public librarian may soon deserve the additional title of Master of Bibliochresis. And if pupils are taught at our grammar and high schools Reading for Profit and the Art of Investigation, there will be no need for the college librarian to instruct any but those who have prepared for college at a distance from the large libraries.

—We referred the other day to the subscription circular sent out by the Cambridge Society for the Collegiate Instruction of Women (Harvard Annex). Two documents also now obtainable of the ladies of the Executive Committee, with Mrs. Louis Agassiz at their head, deserve a very wide circulation, and, wherever they go, will create the disposition to give which the circular just named seeks to profit by. One of these is the Report of the Executive Committee; the other, Extracts from Letters of Pupils. There is little in the Report which we have not communicated to our readers at one time or another, but it is supplemented by the formal testimony of the instructors, who all agree as to the pleasure they have derived from teaching the young women, and the essential mental equality between these and the male students. Professor Dyer has been struck, in his philosophical course in Greek, "with the entire absence of intellectual indifferentism on the part of the young ladies; their questions have been most intelligent, and where the first answer did not satisfy them, persistent—an encouraging sign that they are unwilling to content themselves with words." So Professor Palmer, in philosophy, says: "The girls being keener questioners, I have usually found myself obliged to treat my subject more fundamentally with them than when I have discussed it with my college classes." In political economy, Professor Laughlin observes that "while political and business interest stimulated the men, I think that with the women it was a desire to solve social questions, especially by those who had already known something of charitable movements." All the instructors comment on the eagerness and assiduity of the women; but this was to be expected, under the circumstances. It is pointed out that the system of courses favors the attendance of women whose aim is not teaching or professional employment, but simply the perfecting of their own culture. Finally, as Professor Lane remarks, "Every one of these young women is more or less of a missionary. Therefore, in training one you may be training fifty or hundreds." The extracts from the letters of pupils, in response to a request for their judgment of the value of the Annex, must strike every one as the product of minds deserving the highest training that can be afforded them. The shortcomings they enumerate are mostly if not all easy of correction when endowment gives the Annex a recognized connection with the University. The lack of social relations is one of these, and we presume can only be overcome by the building of a dormitory or hall. Noticeable is the readiness with which the writers inherited, so to speak, the influence of the seat of learning at which their own status was so ill-defined and unsatisfactory. Their pride in the name and fame of Harvard would never suggest the novelty and insecurity of their tenure.

—A document akin to the foregoing, and also useful as a weapon wherever the struggle for the higher education is going on, is a pamphlet, entitled 'The Admission of Women to Universities,' by Mr. W. Le Conte Stevens, whose article on this theme in the January *North American* will be remembered. He presents the replies of various college presidents to stated questions concerning their experience of co-education. The testimony here also is singularly uniform, both as to mental capacity and physical endurance, and as to the humanizing effect of the women students upon the men. On the score of health, indeed, the replies are emphatic. "Fortified as they are," says President Beach, of Wesleyan University, "by the proprieties of their sex, from which they will not and cannot well break away, they ought to be, in college, and I think will be found to be, the hardier sex." There is a single instance of difference of opinion from the Harvard instructors' estimates as to the mathematical capacity of the women. President Le Conte, of the University of California, finds that with few exceptions they "have an aversion to the mathematical studies, and to those branches of exact science which involve the application of mathematics"; and he infers "a reflex influence" of their physical organization on their intellectual manifestations. Against this may be set the fact that one of the Annex students whose letters are quoted chose the department of astronomy, "with private study and practice at the Observatory"; and the explicit assertion of Professor Byerly, that the average marks in his elective mathematical courses have "invariably been higher" with his Annex than with his college classes, though the latter consisted of picked men. Professor Peirce is less laudatory, but among his few pupils have been "some of marked excellence, and all give evidence of ability and a serious purpose." Mr. Stevens's pamphlet concludes with some account of the progress of female education in the English universities. It can be had on application to the Secretary of the Association for Promoting the Higher Education of Women in New York, at No. 53 West Fifty-first Street.

—Mr. Koulouriotis, of Athens, has compiled a modest pamphlet in modern Greek, entitled 'Αλβανικὸν Ἀλφαβητάριον' ('Albanian Primer'). The sources of information respecting the Albanian language are few, and those who are interested in the subject will be glad to be directed to this brief account, by an Albanian, of the language as it is spoken in the Greek kingdom. The little book contains a statement of the sounds of the letters, a collection of popular myths with translation of the same into modern Greek, and a classified vocabulary. Those who are acquainted with modern Greece are aware that there is a considerable Albanian element of population in the immediate vicinity of Athens. Eleusis, Salamis, and Argos are inhabited mostly by Albanians, and the same is true of the islands of Hydra and Spezzia, those nurseries of the Greek marine. Until recently it was the fact that within a short distance of Athens one could meet peasants who understood very little Greek; and though, owing to the improvement of the schools, this would no longer be true of the men, yet it is altogether likely that, if one were to enter a peasant's house in Eleusis, he would find the women chattering Albanian, and the older women unable or unwilling to speak Greek.

The Albanian language is difficult to learn, and it is said to show marked analogy in structure with the ancient language of Lycia, in Asia Minor. It has been reduced to writing, we believe, by the British and Foreign Bible Society, and the New Testament, in whole or in part, has been printed in an alphabet made up of Greek and Latin letters. The different sounds outnumber the letters in either the Latin or Greek alphabet, taken singly. *B* and *v* are found, *g* and *gh*, *k* and *kye*, *d* and *dh*, *z* and *j*, *s* and *sh*, *ch*, as in China, and the sounds represented by the Spanish *ll* and *ñ*. Mr. Koulouriotis has contrived, by turning certain Greek characters alternately to the left and to the right, to represent all the sounds by characters closely resembling the Greek. Σ, for instance, represents *s*, and ϫ represents *sh*. The system seems a good one, for the redundant letters in the Albanian naturally form pairs with certain letters of the Greek alphabet. The compiler claims for his little book that it is the first Albanian grammar printed at Athens, and he also states, we believe correctly, that the idea of making the Greek alphabet, with some modifications, serve as the alphabet for the Albanian language had the approval of the late Mr. George Finlay. On the title-page of the pamphlet is printed the following sentence, which spelling reformers would approve: Ἓν καλὸν ἀλφαβητάριον εἶναι ἡ κρηπὶς τῆς γλώσσης, "A good alphabet is the foundation of a language."

—It is not often that an American audience has an opportunity to hear a native composer conduct a symphony of his own. Such an opportunity, however, was afforded the patrons of the Brooklyn Philharmonic Concerts on Friday afternoon and Saturday evening, on both of which occasions Professor J. K. Paine conducted his second work of this kind, the "Spring Symphony." The immense superiority of spring music over spring poetry will at once strike every one in listening to this fine composition. In choosing this epithet for his symphony, as well as the descriptive titles placed over the different movements —Departure of Winter, Awakening of Nature, May-night Fantasy, A Romance of Springtime, The Glory of Nature—Professor Paine, like Beethoven in the case of his Pastoral Symphony, doubtless intended them to be "more an expression of feeling than an attempt to paint in tones." Nevertheless, there are not a few characteristic passages which are easily recognized as definite descriptive motives. The leading theme of the Introduction indicates the sad feelings inspired by a desolate winter scene. It is worked up with other themes into a stormy climax, suggestive of the boisterous departure of winter, and followed by a calmer spirit, like the arrival of a prophetic breeze laden with the perfume of spring. The allegro paints the awakening of spring by means of a great variety of rhythmic and melodic effects, the soft opening figure being made to flow faster and faster in a crescendo, like a mountain rill, leading into the proper spring motive, which is first announced by the 'cellos and violas. With this spring motive the winter motive is ingeniously interwoven, by means of a variety of contrapuntal devices, producing a mixture of sad and joyous feelings. The ending of this movement is highly poetic. The May-night fantasy is a lovely scherzo—a kind of Walpurgis-night dream, abounding in pretty effects of instrumentation. The spring-time of love is suggested by the adagio, the episode in F minor in which has a sad and almost dirge-like expression. The long pedal point on the dominant makes an ingenious canonic effect with the leading motive. The adagio seems to us less inspired than the other parts, and not equal in beauty to the slow movement of Mr. Paine's First Symphony. The last movement, on the other hand, marks the climax not only of the Spring Symphony, but of its author's creative power. It introduces a sort of hymn of joy in the last movement for full orchestra, the grand harmonies and stirring, vigorous rhythm of which irresistibly make the audience vividly feel the "Glory of Nature."

—Not only Harvard College but America may well be proud of having produced such a musical composition, in which excellent workmanship is combined with originality of invention. A single fault is its extreme length. In this respect a good lesson is taught by Beethoven's Eighth Symphony, which was played at the same concert and only consumed about half as much time—twenty-three minutes. The tendency of modern music is toward concentration of ideas, and this is one of the reasons why symphonic poems seem to be gradually taking the place of symphonies. Professor Paine, too, has written a symphonic poem, "The Tempest," which it is to be hoped Mr. Thomas will give us an opportunity to hear next winter. Attention must finally be called to the brilliant, clear, and effective instrumentation of the Spring Symphony. Professor Paine has the true orchestral instinct, and is in this respect immensely superior to Herr Max Bruch, for instance, who has just left Liverpool to pay this country a professional visit, and who in pure scholarship has few rivals among living musicians. The other features of the Brooklyn concert were Liszt's first concerto, which Mrs. Rivé-King played in a brilliant and quite satisfactory manner; two movements from Spohr's ninth violin concerto, in which Mr. Rhodes displayed the same good qualities heretofore fully commented on, and Berlioz's brilliant and sensuous orchestration of Weber's dashing "Invitation à la Valse," which was prepared as a substitute for the missing ballet music in the "Freischütz" when that opera was first produced in Paris.

LORD LAWRENCE.

Life of Lord Lawrence. By R. Bosworth Smith, M.A., author of 'Mohammed and Mohammedanism,' etc. 2 vols. London: Smith, Elder & Co.; New York: Charles Scribner's Sons. 1883.

Mr. Bosworth Smith has manifestly spared no labor, thought, and study to make his life of Lord Lawrence worthy of its subject; and as a piece of literary workmanship these volumes are worthy of high commendation. As a picture of Lord Lawrence himself, or of India under British rule, they will not be so satisfactory to those who anticipated from Mr. Smith's literary antecedents a certain measure at least of critical discrimination. An excess of enthusiasm is an infirmity from which few biographers are exempt; but the examples are rare in which the malady has been possessed in so acute a form as by Mr. Bosworth Smith. He knows neither weariness nor satiety in enlarging upon the excellences of his hero. Whenever he gets him in a new light, he withdraws his readers, as it were, to a convenient distance, and, "with pointing pole in hand," teaches them what it is proper for them to admire at this stage of his career. He extends these feelings of rapture and enthusiasm—only slightly moderated—to nearly all of Lord Lawrence's friends and official colleagues, with the result, we have no hesitation in asserting, of making his book altogether a disappointment to those who have studied the history of the English in India in a spirit of independent criticism. The book, however, is of great interest. Whatever Mr. Bosworth Smith desires to say, he says well; and it is impossible to deny that here, at last, we have a book on India undefaced by barbarous and unintelligible technicalities, and thoroughly readable from the first page to the last.

The chapters of the greatest interest and importance are those which deal with the great Indian insurrection of 1857, and the long struggle between the mutinous sepoys in Delhi and the handful of Europeans and Punjabees which held the ridge in front of the city. Then it was that John Lawrence became known to the world as a man cast in the heroic mould. He was Chief Commissioner of the Punjab, which had been annexed only a few years before, and he found himself, on the outbreak of the mutiny, cut off from intercourse with the Governor-General in India, without prospect of succor reaching him from England, and compelled to act as the supreme ruler of Northern India, to preserve order in his own provinces, to raise a new army in place of that which had revolted, and to wage war against an insurrection which aimed at, and all but accomplished, the overthrow of British domination in the East. Lord Lawrence, although, like all the other British officials in India, he had had no forefeeling of the insurrection, was the only prominent man in Upper India who discerned at once the gravity of the crisis, and the only means by which it could be encountered successfully. Incredible as it seems, the Commander-in-Chief of the Indian Army and his military advisers were of opinion that an immediate march upon Delhi was not necessary; that the wiser policy would be to collect such troops as they could bring together, with a fortified camp, and stand upon the defensive until reinforcements reached India from England. And but for the earnest advice and remonstrances of John Lawrence there would have been no advance upon Delhi.

"Your Excellency," he writes in one of these urgent epistles to General Anson, "remarks that we must 'carefully collect our resources.' But what are these resources but our European soldiers, our guns, and our material? These are all ready at hand, and only require to be handled wisely and vigorously to produce great results. . . . Pray only reflect on the whole history of India. Where have we failed when we acted vigorously? Where have we succeeded when guided by timid counsels? Clive, with 1,200 men, fought at Plassey, in opposition to the advice of his leading officers, beat 40,000 men, and conquered Bengal. Monson retreated from the Chumbal, and before he gained Agra his army was disorganized and partially annihilated. Look at the Cabul catastrophe. It might have been averted by resolute and bold action. . . . Our friends, of whom we had many, only left us when they found we were not true to ourselves. How can it be supposed that strangers and mercenaries will sacrifice everything for us? There is a point up to which they will stand by us, for they know that we have always been eventually successful, and that we are good masters. But, go beyond this point, and every man will look to his immediate benefit, his present safety. The Punjab irregulars are marching down in the highest spirits, proud to be trusted, and eager to show their superiority over the regular troops; ready to fight shoulder to shoulder with the Europeans. But if, on their arrival, they find the Europeans behind breastworks, they will begin to think that the game is up. Recollect that all this time, while we are pausing, the emissaries of the mutineers are writing to and visiting every cantonment."

These letters had the effect of infusing a more energetic spirit into the counsels of the Commander-in-Chief and his staff. They marched for Delhi, but too late to stamp out, as might originally have been done, the insurrection at a single blow. Nearly four months had to pass away before Delhi was stormed and taken; and, in truth, it would never have been stormed and taken but for the invincible fortitude and determination of John Lawrence. At one time some of his most trusted subordinates, even in the Punjab, questioned the wisdom of his policy to risk everything rather than allow the small be-

sieging force to withdraw from Delhi with their task unaccomplished. They advised that he should leave Delhi to its fate, and concentrate all his resources for the defence of the Punjab. But Lawrence never wavered for an instant. He saw that British authority in the Punjab absolutely depended upon success before Delhi. The chiefs and soldiers in the Punjab had not, at the outbreak of the mutiny, comprehended the magnitude of the crisis. They regarded it as a military *émeute* which, by discrediting the sepoys, would open for them a way into the military employ of the East India Company; and hence the alacrity with which they came forward with the proffer of their services. But as days grew into weeks and weeks into months, and Delhi was uncaptured, and everywhere, except in the Punjab, the authority of the British throughout Bengal was wholly or partially annihilated, they understood what a splendid opportunity for recovering their independence they had allowed to escape. The Sikhs inside Delhi—and they were numerous—despite all overtures fought desperately against the English to the end. Those who participated in the siege, although they would not abandon the English so long as they held their ground, would certainly have made common cause with the enemy if General Wilson—the successor of General Anson—had raised the siege, as at one time he desired to do. Lawrence saw all this clearly. Writing to Lord Dalhousie, after the rebel fortress had fallen, he says:

"We have indeed had a terrible time. Up to the capture of Delhi, the scales were trembling in the balance. The Punjabees of all classes have behaved admirably, and the zeal and courage of the Punjab troops have far surpassed my hopes and expectations. Still, if Delhi had not fallen, we must have been ruined. Had the troops retreated, all must have been lost. Had, indeed, the storming not succeeded, all must have gone."

And Delhi could not have fallen if Lawrence had not discerned at the outset that there it was that the fate of the British in India had to be decided, or, having discerned it, had lacked the courage to strip the Punjab of its garrisons until the besieging force had been sufficiently strengthened to assail the fortress with success. When, at last, Delhi was captured, the humanity of the man shone no less conspicuously in the hour of success than his courage during the season of darkness and trouble. He preserved the mosques and palaces of Delhi from the destruction which would certainly have overtaken them if the military authorities had been allowed to have their way; he put limits to the immeasurable rapacity of the prize agents, and sternly repressed the inhumanity of the military commissions; but, unhappily, not until much had been done which Englishmen of future generations will be very loth to be reminded of,

At the time of the great insurrection, it was generally regarded as a half-frantic revolt of barbarism against a higher civilization which it both feared and hated; but with the lapse of years this view has been largely modified. Even Anglo-Indian officials are now willing to admit that British rule in India before 1857 was a rule defaced by great and grievous defects; that the upper classes had been reduced from a state of prosperity and influence to one of extreme indigence; that the revenue administration and judicial procedure pressed with a crushing weight on the mass of the people; that the high-handed and unscrupulous manner in which Lord Dalhousie carried out his annexation policy had, with reason, destroyed the popular belief in British candor and equity; that an insurrection, in brief, was an incident which might and ought to have been anticipated. The very fact that the sepoys of the native army believed that the "greased cartridge" was manufactured with malice prepense, for the express purpose of destroying their caste, and compelling them, against their wish and will, to become Christians, shows the profound distrust with which the policy and behavior of the English in India must have inspired the minds of the people. The facts being so, it becomes not a little perplexing that a man such as Lord Lawrence should have been so absolutely taken by surprise as it is plain from this biography that he was.

The explanation would seem to be this: Lord Lawrence was essentially a man of action, not a man of thought. There is nothing in these two bulky volumes to show that he ever devoted even a moment's thought to what was to be the final end and outcome of British domination in India. He passed his official life buried in questions of administrative detail, which, apparently, left him without leisure or inclination to look beyond them, or to reflect upon the possible consequences of such a sweeping political revolution as Lord Dalhousie was endeavoring to accomplish throughout the continent of India. And thus he failed to discern "signs of the times" which men far less eminent than himself, and with not a tithe of his knowledge and experience of India, had detected clearly enough. We have called attention to this fact because it is here that the inherent vice and weakness of British rule in India are to be looked for. In all civilized countries there is a division of labor; the business of political thinking is never carried on by the same persons upon whom devolves the business of practical legislation. In India alone the administrator has to do his own thinking. It is demanded of him that he should not only be his own "Mr. Gladstone," but that he should be also his own Bentham, Mill, newspaper press, and public opinion. And the only time he has for thinking is after an exhausting day spent in the consideration of multitudinous petty details—a discipline as inimical to comprehensive and synthetic habits of thought as it is possible to imagine.

"I begin," writes Lord Lawrence to Sir Charles Wood, in reference to his work as Governor-General (and the account is equally true of his life as Chief Commissioner of the Punjab), "at 6 A. M., and, with an interval of half an hour for breakfast, I sit at my desk until 5:30 P. M., working all the time as hard as I can. When necessary, I work again after I come in from my ride or drive." How can a man think under such a burden as this? How is he to find the leisure to look before and after? Sufficient unto the day is the evil thereof. And the account which Lord Lawrence gives of his official life as Governor-General might apply to that of almost every English civilian in the country. They are all borne down and overwhelmed by a huge mass of official details. Every day they have, Sisyphus-like, to roll a huge stone to the top of a hill; and each succeeding morning they find another, similar in size and weight, awaiting the commencement of the day's labor. When the task is accomplished, the spent and exhausted official has about as much energy left for thinking as a man would who had just rowed stroke-oar in a closely contested boat-race. And so it was that an insurrection like that of 1857 could be secretly matured in the hearts of the people without their English rulers having a thought of the approaching catastrophe.

There is, however, still another question requiring an answer: How was it that the British officials obtained no information? And this leads us on to a question of policy which is discussed at considerable length in these volumes. When the Punjab first became a British province it was placed under a Board of Administration, the leading members of which were John Lawrence and his brother, Sir Henry. The differences between the two brothers—mainly upon one important matter—led to the dissolution of the Board and the appointment of John Lawrence as Chief Commissioner, his brother being transferred to another province. The point at issue between them was the treatment to be meted out to the chiefs and large landholders who flourished in the Punjab under Runjeet Sing and his successors. Sir Henry thought they ought to be maintained in the enjoyment of their lands and other privileges; Sir John was of opinion that the severity of British rule required that they should be (to quote his own expression) "reduced to the plough" by the gradual resumption on the part of the state of the lands which they occupied. Lord Dalhousie, agreeing with the views of John Lawrence, removed his brother from the Punjab, and made John the sole Governor of the province. Now, this dispute between the two brothers is one that came up for settlement whenever an Indian kingdom came under British rule; and it is a remarkable fact that those Indian administrators who were best acquainted with the government of independent native states have, almost without exception, been in favor of preserving to the native aristocracy their ancient rank and privileges. On the other hand, civilians—as, for example, John Lawrence—who knew, by direct experience, only those provinces where British rule had long been established, have always been jealous and suspicious of natives of rank and influence. They have professed to see in them nought but consumers of the public revenue which, with greater advantage to the body of the people, might be diverted to the coffers of the state and by it expended upon administrative improvements. Hence, their constant aim has been to grind down all classes and orders of men to a dead level over which (as they declared) the wheels of the administrative machinery would work with the smallest possible amount of friction. And in this policy they have been entirely successful. The descendants of the men who governed provinces and commanded empires in the days when India was independent would now be found, if they could be found at all, following a plough, almost as ignorant and quite as unambitious as the bullocks they were driving. But this result has incalculably weakened the authority of the Government. Turbulent and adventurous as these men were, they represented the most advanced, the manliest, and most vigorous classes in the population, for eminence in a native state is rarely due to birth alone; and the reduction of these men to insignificance, under the levelling tendencies of British rule, has affected India very much as the expulsion of the French Protestants by the revocation of the Edict of Nantes affected France. By the destruction, moreover, of these—the natural leaders of the people—the English unintentionally created a sort of bastard aristocracy out of their own subordinate native officials. These really governed India, for no information could reach their English superiors except such as they chose to supply; and they were careful to supply none but tidings of general joy, contentment, and prosperity at a time when all classes in the land were suffering from their rapacity and oppressiveness. The English, in short, having removed the people to a vast distance from themselves, interpreted as peace the solitude which they had created, and were only awakened from their pleasing delusion by the terrible events of 1857.

The incidents of Lord Lawrence's life subsequent to the mutiny can be told in a few words. He came home to be greeted, and deservedly so, as the saviour of the Indian Empire; and a couple of years later, upon the death of

Lord Elgin, he returned to Calcutta as Governor-General. His viceroyalty was free from startling events, but it was notable for hard, unceasing, unobtrusive labor in the interest of the masses of the people. Never in India, either before or since, was the business of government carried on with such regularity, promptness, and punctuality as under the government of Sir John Lawrence. He was sedulous to allow no arrears in his own work to accumulate, and was rigorous in the exaction of the same from his subordinates. The last act of his simple and heroic life was to head the opposition to the insane invasion of Afghanistan in order to find a "scientific frontier" which existed nowhere, and least of all in the brain of the statesman who invented the phrase. It is a singular illustration of the wisdom with which the world is governed that his judgment on this question—the fruit of thorough knowledge and long experience—should have been contemptuously rejected in favor of that of Lord Lytton and Sir George Colley.

MORTILLET'S PREHISTORIC ANTIQUITY.

La Préhistorique Antiquité de l'Homme. Par Gabriel de Mortillet, Professeur d'Anthropologie préhistorique à l'École d'Anthropologie de Paris. Paris: Reinwald; New York: F. W. Christern. 1883. 8vo, pp. 642.

In this volume M. de Mortillet has given us the result of many years of study, and, as he is a recognized authority in archæology, his conclusions are entitled to a respectful consideration, whatever may be thought of their soundness or of the illogical manner in which he sometimes deals with his evidence. As a matter of course, the work is more or less controversial in character, and yet it is but justice to say that, in spite of his strong convictions and of the prominent part he has played in all the discussions that have taken place on the question since the discovery of flint implements in the valley of the Somme first made the antiquity of man a living issue, he has given us as complete and (apart from his theories) as satisfactory a résumé of all that is known upon the subject as any that has yet been published. This he has done in a simple and attractive manner, without the slightest attempt to conceal or gloss over the weak points. Indeed, so far is he from availing himself of any technical advantage in the arrangement of his evidence—or perhaps it might be more correct to say, so satisfied is he of the truth of his theories—that in beginning the investigation with "tertiary man," the very point where, logically and scientifically, he is believed to be most vulnerable, he may be said almost to have courted a fall.

Strictly speaking, the expression "tertiary man" is deceptive, as our author does not recognize the existence of man in this epoch, though, as an archæologist, he is satisfied that when the miocene beds of western Europe were laid down there lived a being who built fires, chipped flint implements, and, we may add, did everything that the river-drift man of quaternary times can be shown to have done. This being, however, was not man; for our author, speaking now as a palæontologist, tells us that, according to "palæontological laws," it is impossible that man could have been in existence at that remote epoch—the contemporary of a fauna now extinct—and have preserved his type unchanged amid all the geological revolutions that have taken place since that time. To bridge over this difficulty he is reduced to the necessity of inventing a sort of ape-like precursor of man, which he calls an anthropopithecus, and which he endows with intelligence enough to build fires and manufacture stone implements. This is substantially his position, and a more unsatisfactory one, no matter from what point of view it be regarded, cannot well be imagined. So far as palæontology is concerned, it is a sufficient answer to say that the laws that govern the development of animal life do not apply to man to the same extent that they do to other animals; and even if they did, our author's position would not be strengthened, since in inventing a creature possessed of a man's intelligence, and calling it by some other name, he is simply "whipping the devil around the stump." If the stone implements found by Bourgeois and Ribeiro in undisturbed tertiary beds in France and Portugal are artificial—and of this there cannot be much doubt, in view of the testimony of Franks, Engelhard, and Worsaae, to say nothing of Mortillet himself—then they are the work of man, because, so far as we know, man is the only being that ever existed who has built fires and manufactured stone implements. This fact is a bar to all speculation on the subject; and until it is proved that, at some time in the world's history, there has existed some creature other than man who has also made fires and chipped stone implements, we may safely dismiss the anthropopithecus to keep company with the "boojum" in the realms of wonderland. And here we may also add that, if the geological formations in which these evidences of man's handiwork have been found belong to the tertiary epoch, as they are said to do, there can be no doubt that man existed at that time. The conclusion is inevitable, and the sooner the so-called laws of palæontology are made to correspond with the fact, the better will it be for certain palæontologists.

In treating of the existence of "tertiary man" in America, our author is even more unsatisfactory, not because he has seen fit to discredit the fact, but because the grounds upon which he does so are wholly insufficient. Thus, in ruling out the evidence of the Calaveras skull, he tells us that although it came into Prof. Whitney's hands nearly twelve years ago, yet he has never published an account of it. In making this statement, our author betrays inexcusable ignorance; and when he goes out of his way to attribute this "long silence" to the influence of "the clergy," he is simply impertinent. In point of fact, Prof. Whitney, in July, 1866, within a few months after the skull was discovered, presented to the California Academy of Sciences as full a description of it, and of the circumstances under which it came into his possession, as it was possible for him to give at that time; and this account was soon after published in the third volume of the proceedings of that body. Since then he has lectured upon the subject at different times; and in a work entitled the 'Auriferous Gravels of California,' issued in 1880, he has proved, as conclusively as human testimony can prove anything, that not only was this particular skull taken from the "cement," but that other human bones, as well as stone implements of various patterns, have at different times been found in the same geological formation. Whether he is right in ascribing this formation to pliocene times is, perhaps, an open question, though even upon this point the evidence of the flora and fauna would seem to be decisive. These have been submitted to a close examination, and are said to be distinctly pliocene; in fact, we are told that, while the bones of an extinct fauna are more or less common, not a single living species of animal has yet been found in these beds. That this skull closely resembles that which is supposed to be characteristic of certain Indian tribes of a low order of intelligence is true, and it is also true that some of the stone implements found in these gravels show a higher degree of skill than the river-drift man of the succeeding geological epoch is supposed to have possessed; but to assume, as is not unfrequently done, that these facts furnish data for a conclusion as to the age of the beds from which the specimens were taken, is virtually to beg the whole question. So far are they from throwing any light upon this point, that they may be said to involve questions that depend for their solution upon the way in which the geology of this region is itself finally settled.

Coming down to quaternary times, our author is on firmer ground. The anthropopithecus has disappeared, and in its stead we have man, not perhaps of a very high order, but still man, such as he is to-day. The proof of this consists in certain rude stone implements which are found in the river drift, and are supposed to show marks of human workmanship. Practically, it is the same sort of evidence as that which was discovered in the tertiary beds of France and Portugal; and though it is not regarded as sufficient to demonstrate man's existence at that time, yet in the present instance it is held to be conclusive, for the reason that the palæontological conditions that are supposed to have ushered in the quaternary epoch are believed to have been favorable to his appearance. This point having been settled to our author's satisfaction, all the rest becomes plain sailing, as it now only remains for him to follow man down through the various geological changes, until he is brought face to face with conditions that characterize the flora and fauna of existing times. For this work our author is well fitted. His familiarity with the character and geological position of the numerous archæological discoveries that distinguish this epoch, joined to his thorough knowledge of the methods of the ancient workman, as displayed in the choice of material and the character and quality of the work, enable him to trace with a masterly hand the gradual development of industry from the rudely chipped stones of the river-drift to the carved and polished ornaments and implements that mark the close of the quaternary and the beginning of what is termed the existing epoch.

So long as he confines himself to this branch of his subject, and limits himself to a description of these "finds," and to discussing their bearing upon the question of the antiquity of man, he may, as a rule, be followed safely and with profit. But when he forsakes this path, and begins to theorize upon the facts, it becomes necessary to proceed with caution, as he is very apt to push his conclusions further than the premises will warrant. Thus, in the summary which he gives of the results of his investigations, he tells us that man appeared in Europe at the beginning of quaternary times; and this may be safely conceded even if we do not put it still earlier, though it is by no means certain that the facts justify us in fixing the precise date of that event at not less than from two hundred and thirty to two hundred and forty thousand years ago. So, also, we may entertain serious doubts as to the peaceable character of "quaternary man," though perfectly satisfied of his gradual advance in mechanical and artistic skill, and convinced that during all this time he dwelt in caves and rock shelters, and lived by hunting and fishing. And, finally, the practice of burying the dead and of wearing ornaments (or, as they are called, amulets) can hardly be considered as proving definitively the "religiosity" of neolithic man, though there is reason to believe that the former of these customs was introduced into western Europe by a race of brachycephalous invaders from Asia, who brought with them the knowledge of pottery, of agriculture, and of the domestication of animals. Before making up our minds upon the doubtful points here indicated, and some others that might be

mentioned, it is advisable to wait for the additional word which we are told archæology is yet to speak, and which, let us hope, she will utter in such a decided manner as will make it impossible to subordinate that which she teaches as fact to theories drawn from palæontology or any sister science.

RECENT NOVELS.

The Siege of London; The Pension Beaurepas; and The Point of View. By Henry James, jr. Boston: J. R. Osgood & Co. 1883.

Shandon Bells. A Novel. By William Black. Illustrated. Harper & Bros. 1883.

Gideon Fleyce: a Novel. By Henry W. Lucy. [Leisure-Hour Series.] Henry Holt & Co. 1883.

My Connaught Cousins. By the author of 'The Queen of Connaught.' [Franklin Square Library.] Harper & Bros.

George Van Brugh's Mistake. By H. Baden Pritchard. [Franklin Square Library.] Harper & Bros.

The Golden Shaft. By Charles Gibbon. [Franklin Square Library.] Harper & Bros.

Divorce. By Margaret Lee. John W. Lovell Co.

The Surgeon's Stories. First Cycle. Times of Gustaf Adolf. By Z. Topelius. From the original Swedish. Chicago: Jansen, McClurg & Co.

A Word, only a Word. By George Ebers. From the German by Mary J. Safford. William S. Gottsberger.

An Honorable Surrender. By Mary Adams. Charles Scribner's Sons.

It was a Lover and his Lass. By Mrs. Oliphant. [Franklin Square Library.] Harper & Bros.

Criquette. Par Ludovic Halévy. Paris: Calmann Lévy; New York: F. W. Christern.

Le Bonheur des Dames. Par Émile Zola. Paris: Charpentier; New York: F. W. Christern. [In English, translated by John Stirling. Philadelphia: T. B. Peterson & Bros.]

'The Siege of London' is Mr. James's latest study in international manners, and deals with a subject of deep contemporaneous interest—the possibility of an American lady of doubtful matrimonial antecedents getting into good English society. Mr. James has, we think, rather exaggerated the problem by making his Mrs. Headway a little too much divorced. She has been married to four or five husbands, and during one winter her own sister did not know what her legal name really was. Moreover, she has tried New York and has failed; yet she succeeds in getting taken up in England and marrying a man of title whose mother is anxious to prevent the match, and who himself is made afraid by his suspicions of his *inamorata.* Anything is possible in love; but we have to carry faith pretty far to believe in Mrs. Headway. In some respects 'The Siege of London' is one of the best of Mr. James's international sketches. The skill with which he reproduces the impression made on the various persons with whom his heroine is thrown in contact is inimitable. The story will probably be sharply criticised, as unfair to "society" in London and to American manners; indeed, even New York, which first rejected Mrs. Headway as an impossible person, comes in for a terrible piece of satire at the end, when it appears that since her English marriage people here are beginning to manifest an interest in knowing who Mrs. Headway is.

The story contains a hint that is of some social interest—viz., that Americans, or at any rate American women, now succeed in English society not by imitating the English, but by being as American as possible. It is the difference and novelty which constitute their charm, and the more original and eccentric they are the better Americans they are supposed to be. The one thing they must do is to amuse, and as they have, as a rule, a great deal more social brightness and vivacity than English women, this is not very difficult. But only an adventuress of genius could, under Mrs. Headway's circumstances, make Mrs. Headway's match. 'The Pension Beaurepas' and 'The Point of View' belong together, one being a continuation of the other, and both together forming a most amusing study of international life.

Mr. Black would hardly make a reputation, if it were necessary for him to make one, out of 'Shandon Bells.' It is an Anglo-Irish story, with a love plot and a good deal of literary life—enough of the first to show the reader the truth of the old proverb about the character of the path of that passion when it is true; and of the second to let him into some of the secrets of the trade. It is not a novel to stir the blood, but it possesses the narrative charm of all Mr. Black's stories, and just enough of his pleasant humor to relieve it from the charge of dulness.

It is reported that 'Gideon Fleyce' created a sensation in London because of its lifelike sketches of certain well-known public characters. This may well be, but the book challenges admiration on its merits as a story, and will be read with pleasure by readers who know nothing and care as little about London notabilities. It combines various kinds of merit more or less rare by themselves, and rarer still in combination. Its style is attractive in its artful or, rather, artistic simplicity. Its plot is more intricate and more full of surprises than one is accustomed to look for nowadays, and, though hovering on the brink of melodrama, never actually loses its air of every-day, newspaper reality. It is a study of character, but not an obtrusive study. We learn to know the principal personage much as we learn to know a person in real life. We revise our opinion of him from time to time; occasionally we suspect that we have been mistaken in him; and it is only toward the end that we feel as if we really knew him. The author presents him to us in a semi-sarcastic sort of way, much as a gentleman might introduce us to an acquaintance whom he did not care to vouch for, but against whom he did not wish to prejudice us. He plays with him as a cat does with a mouse, and evidently has a sneaking kindness for him with all his faults. The art of the author is shown in various ways. Many of the scenes he describes and of the topics he handles have been almost done to death in English novels of the past quarter of a century. There is an election, there is a dinner-party, there is a trial, there is a good deal of what in unskilful hands would be at once condemned as impudent and superfluous padding; but in Mr. Lucy's hands it is all fresh and graceful and interesting, and when the reader has finished the book he would not willingly dock it of any of these accessories. Mr. Lucy's minute and accurate familiarity with certain out-of-the-way phases of Jewish habit and character makes it seem probable that he is of Jewish descent and was brought up in such a Jewish household as he describes. It is true, his description is not by any means complimentary, but that only makes the conjecture more probable, for converts are proverbially zealous.

'My Connaught Cousins' are a bevy of winsome girls from whom, or through whom, are gathered a collection of eerie legends or grim tragedies such as might be expected in County Mayo to-day. The most original and the most entertaining tale is in a different strain. It is a Shrovetide match-making of a sort that we are more accustomed to attribute to the prosaic calculations of the French bourgeois than to the happy-go-lucky instinct of the Irishman. It may be read with the more enjoyment since the blooming Norah is rescued from the sordid clutches of Shamus Beg and his son by the bold dash of her own true lover. Says Macdermot:

"'Another heifer! Troth, then, I never will. Don't ye know already that Norah has the biggest fortune of any girl in Storport? There's five cows (four milch cows and one in calf) and two fat pigs ready for rent day; a strong donkey for drawing turf, and three pounds in gold.'

"'And if she has, what is it? Hasn't my boy got a good house and a bit of land, and foreby that a strong mule and a good cart? There's plenty of fortunes in the village that's waiting for him, believe me, so if ye don't throw in the heifer, I'll just take myself to another house.'"

The girl's anxious mother interposes:

"'Will ye take a small sow, Shamus Beg? Tony would make it a sow.'

"'I would not, then,' returned her husband.

"'Is that your last word?' asked Shamus.

"'Troth, and it is, thin; unless, indeed, ye'll take a couple of pigs out of the litter there and make the matter right.'

"Shamus walked over to the corner and gazed meditatively at the litter of pigs which were reposing on the straw. 'Will ye say three, Sham Macdermot?'

"'No, I will not say three.'

"'You will not? Wall, would two and a couple of hens be any loss on ye?'"

Whereupon the mother settles it: "'Ye'll make it a couple of hens and pigs and say no more about it.'" The girl who is thus bargained away to a man she has never seen, "white as any corpse, shrank further into the shade," and the reader himself breathes more freely as he finds her rescue on the next page.

'George Van Brugh's Mistake' contains two very good character sketches in the Dickens manner—Mrs. Parkle and Job Hollings. The tale itself turns upon that transparent villany and that blind credulity without which novels must have come to an end long ago; but this is redeemed from triteness by the pretty country life in which it is set, and by the long-suffering, unswerving faithfulness of Job Hollings. It seems pitiful that such a mistake must be so costly, yet one feels that a story of such devoted patience could end fitly only in a better world than this.

'The Golden Shaft' is worth reading if for nothing else than the cleverness with which all the characters are made to attend, almost as for life or death, upon the unwindings of the much-tangled plot. Morally, there may be some doubt about the story, in this sense, that in the laudable desire to prove that nobody has been very bad, and that nobody need be ashamed of himself or his forbears, it appears as if there had been a great deal of needless suffering, and as if one life, at least, had been wrecked merely to make a story. The one thing that reconciles us to the existence of suffering is its inevitableness, and the moment it seems to be wantonly inflicted, we recoil and spare our sympathy by remembering that this is only fiction.

'Divorce' is full of good intentions which we fear are futile from the extravagance with which the characters are drawn. They are taken from the newly rich of New York. The wife has every virtue and grace, combined with remarkable mental ability. Superlative creature as she is, she is not in herself impossible. The difficulty lies in the supposition that a man could desert such a woman for a faded, pretentious person of doubtful character. It makes him at once such a knave or such a brute that the indignant denial rises on the instant—the story never was and never can be true. It is probably by accident that it parallels in richer,

if not higher, life 'A Modern Instance,' but in that story the poor wife by her very faults proved herself a reality.

To each his own taste, and surely never more so than when an author chooses his subject; but reading the sketch introductory to 'The Surgeon's Stories,' it seems a matter of great regret that Topelius had not chosen to describe men and things he had himself known. It would take but little to make the surgeon a worthy companion for some of Fritz Reuter's best figures. "An heirloom like the old man Bäck—the uncle of all and the confidant of all—was one of the little town's household guardian spirits, without whom it was impossible to conceive how the general welfare could be maintained."

We have ourselves raised the question heretofore whether the day of historical novels has not passed. Be that as it may, there cannot be two opinions about such times and scenes as both Topelius and Ebers have selected to portray in the books before us. Gustaf Adolf, like Philip II., lived in a time of hard, brutal cruelty. The men who stand preëminent in them for justice and humanity stand so by contrast with the dreadful background. Modern sentiment, let us be thankful, shrinks from such sights, and neither author has failed to appreciate that fact. But it would be well had they gone a step further and realized that therefore a true picture is impossible. The perspective is distorted, the high lights are blurred for want of their corresponding shadows. A few striking episodes are given, but the whole lacks reality. Ebers, moreover, has striven to cover too wide a field. A generous, daring boy sets forth in life, believing in the charm of one word to win for him all that is best—fortune (luck), art, fame, power, and at last love. The Black Forest, Madrid, Florence, Lepanto, Antwerp—it is almost all Europe, and a great deal of the sixteenth century; too much by far to put between two covers. And we return to our first suggestion: what if all this skill and labor had been bestowed on something Ebers had known at first hand?

'An Honorable Surrender' is well written—in some respects, very well written. Yet many readers will pause at the close to consider whether to class it with 'A Fair Barbarian' or with 'An Earnest Trifler.' This, it will be perceived, is to ask the question: Has it a voice of its own, or is it but an echo? Some will reply in the words of the heroine herself, "It was not imitation, but real likeness." Others will hold their judgment in suspense until the author shall give some further proof of original power. The two men are of purely conventional types, the one, "obviously a gentleman," the supposed product of culture, the other the "man of nature." The heroine cannot be rendered in one phrase, nor in many. In fact, much of the doubt about the book will be upon the point whether she is made consistent with herself, or with any probable theory of the thoughts and deeds of young ladyhood. The author has undeniably succeeded in making her attractive, though she endows her with a subtlety of analysis and reflection quite unlikely in a girl of twenty. In her study of George Eliot, she has overlooked the fact that the abstract arguments, the keen logic, the delicate balance of motive occur only in the author's own comments. The words and formulated thoughts of Dorothea Brooke and Gwendolen Harleth are concrete and simple to the last degree.

The work is clearly that of an inexperienced hand. A loveless marriage as an escape from poverty is the temptation of the heroine, but, for aught that appears, she is the heiress of "Fairfields." That may mean dulness, stagnation; it is not poverty. To dwell each half-dozen pages upon the youth and freshness of hero No. 2 may be pardoned, but when in addition he is described for the fourteenth time as "boyish," the insistence of epithet becomes ludicrous. Alice's father is so amazed at her growth during a three years' absence that he does not know her, but he has prepared as a surprise for her an elaborate dress, which fits to a marvel. In a novel, dress as a due accessory has its importance and is pleasing. Dress for its own sake becomes importunate, annoying. One who means to master the art of novel-writing might learn much from George Eliot and Miss Thackeray, who, though so different from each other, never make a mistake on this point. The whole subject of dress in fiction would be profitable to an essayist. Besides its value as a part of the picture of contemporary manners, it frequently curiously reveals the personal traits or associations of the writers themselves.

From fine phrases and strained self-questionings it is delightful to turn to the gentle simplicity of Mrs. Oliphant's people. True story-teller that she is, the coming of a new book of hers gives the same assurance of sweet, fresh pleasure as the tidings that the June roses are in bloom again. She takes us this time to Scotland, where we first knew 'Katie Stewart,' a life-time ago for some of us. There is old Sir Patrick, who lived twice as long as was expected, and his son, who was as old as himself. There is the manse, full of gay voices, whither, for the sake of the bonnie Katie, come "the lang-leggit laddies"; and the dim old manor-house where sit the ladies of Murkley, Margaret queening it bravely—queen-regent only, though she be—and Jean, that sweetest of all women, "an old maid who is still a young one." Above the village rises their father's folly, a great palace uninhabited and unfinished; white and splendid, but all naked, vacant, and silent. The hero is a *preux chevalier*, and the heroine, though with a very distinct self of her own, is another of the tender, impulsive, high-hearted girls whom Mrs. Oliphant has so long loved to draw.

Admit that the whole has a little the air of prearrangement, that things may not have fallen quite so of themselves, the picture is so attractive that we gladly lend ourselves to the illusion, and believe at least in the might-have-been. Mrs. Oliphant's scenes and people have always had a tender glamour over them, yet not a light of dreams nor of faery. It is like what this *preux chevalier* sees as he comes driving into Murkley village late in the summer evening of the Far North, "when it is sae lang light." "In that wonderful light everything had been softened and beautified—a sort of living romance was in the air; and the evening softness, and the strange magic of the lingering light, had given a charm to everything." More stirring tales will be sought for respite or forgetting in the midst of hard work, but these peaceful chronicles will beguile the long afternoons of youth's summer holiday, or solace the hours of age when the work is all done. *Grata quies.*

'Criquette' is a tale of theatrical life. It discusses incidentally and with cold and bitter sarcasm social conditions not freely discussed in American novels intended chiefly to be read by that curious entity, the Young Girl. Criquette herself is as innocent and as good in her way as was the Abbé Constantin in his way. We see her first a tiny child in the streets, before she made her appearance in a fairy spectacle at the Porte St.-Martin as a pert little princess. We see her after she has left the stage and entered a convent to be educated. We see her when she runs away again to go back on the stage. We see her at last when she goes forth to death to save the life she loves. Around Criquette hangs a whole gallery of theatrical portraits—Pascal, who is her first defender, Leruche, the old manager who had created four parts at the Théâtre-Français, and his sister, and the leading actor, whose wife scolded the young ladies who resisted his fascinations. All the minor characters are drawn with a firm touch and an extraordinarily clear sense of humor. Altogether, 'Criquette' is a stronger piece of work than the 'Abbé Constantin,' though certainly less adapted to be made a text-book in American schools for young ladies.

M. Zola's new novel is just the reverse of M. Halévy's, being both dull and dirty. Of all his works it is the least readable. It lacks interest. The story is weak and it is feebly told; yet the idea of it was fertile. Just as in 'Pot-Bouille' M. Zola confined most of his action and nearly all of his characters to one dwelling, so in the 'Bonheur des Dames' he confines them to one huge shop. His story tells of the growth of one of the gigantic bazaars dear to all good Americans in Paris—the "Bon Marché" or the "Louvre." We might call it a French version of the 'House of a Merchant Prince,' except that the French Merchant Prince is a retailer, and that the only ship whose commerce concerns him is that on the arms of Paris. Here is a subject worthy of Balzac, whose name is ever at the end of M. Zola's pen whenever the novelist turns critic; and what Balzac would have made of it we can imagine. But we are reminded rather of Rétif de la Bretonne. M. Zola's moral code is as bad as Rétif's, and yet he lacks the straightforward and honest frankness of his predecessor. It was announced that M. Zola had heard the call to repentance, and that the 'Bonheur des Dames' was to prove that he, too, could abjure sack and write cleanly, if he would; and it is true that the book is much less offensive than its forerunners. But it is disfigured by the same hopelessly low tone, by the same disbelief in any nobility of thought, word, or deed, by the same grovelling incapacity to be clean, even when cleanliness is the most marketable quality.

WALFORD'S INSURANCE CYCLOPÆDIA.

The Insurance Cyclopedia. By Cornelius Walford, F.I.A., F.S.S., Barrister-at-Law. London: Charles & Edwin Layton; New York: The *Spectator* Company.

MUCH of the confusion in Probabilities is owing to the lack of distinction of its subdivisions. As a matter of fact, the science has three branches so distinct that the methods of the one apply only in part to the others. The first of these branches is the science of the Chances in which the probability of a single event is considered. Such is the probability of any given throw of dice or turn of cards. It may be applied to human events, as, to the outcome of a business enterprise or the probable time of death of an individual, and the attempt has been made to apply it to judicial affairs. This branch of the science depends for its certainty on the amount of our knowledge, and its results are but the expression of our ignorance. When applied to practical affairs, it has been justly accused of taking the nature of gambling.

The second branch is the science of the Mean, in which the most probable result is drawn from many measurements of an individual object. The circumference of the earth is absolute, and could be expressed, if known, to the fraction of an inch, but its measurement is subject to a large number of errors which we are unable entirely to eliminate. Different measurements give results which, when made with all possible accuracy, differ from each other. The question then is, What is the most probable value as shown by these measurements? and it is this question which

the science of the Mean enables us to answer. In this division falls the theory of errors.

The last is the science of Averages. The preceding is applied to things which have an absolute though unattainable value. The science of averages gives simply representative values to things in themselves different. The first branch, then, gives the measure of certainty, the second the certainty of measurements, and this, approximation to a type. The first and second deal with individuals, this with large numbers. There is no absolute length for rivers, nor height for mountains, nor weight for horses, nor stature for men, but there is in each case an average value. It may not be true for any individual, but it represents that feature of the class, and the larger the number of individuals employed in getting it, the more nearly representative does it become.

It is to the last branch that belong the deductions from statistics. The demonstration of their stability is now more than a century and a half old. Their development in the hands of many eminent men, notably in those of Quetelet, has brought out into plain view the curious certainty of events among large numbers of men. For any given country the number of births, deaths, suicides, dwarfs, blind, is almost invariable from year to year or province to province, and is determined by the average of human emotions, passions, and contingencies. Thus it is possible to predict with a great approach to accuracy how many suicides will occur in France or Germany next year. It is not, however, possible to point out the individuals who will commit this crime. Here lies the moral advantage of financial ventures founded on the third over those founded on the first branch of probabilities. For the former the event, being an average, is fairly certain; for the latter the event is uncertain. The former is a fair business venture, the latter is a wager.

Walford's 'Cyclopedia' is a book which gives, with unusual fulness and accuracy, the raw materials for one part of the science of averages—viz., that part which relates to human misfortunes, casualties, disease, death, and to the business of insuring against them. It treats of marine, fire, health, accident, and life insurance, and contains much interesting information concerning the kinds of so-called insurance which properly come under the first branch of probabilities and are really forms of gambling. The author has planned the work on no small scale. It is not only a dictionary of the terms used in insurance, but it is also full in the biography, bibliography, and history of the subjects, and is a compendium of vital statistics. The author ranges with fair fulness and accuracy from Harvey to the Gunpowder Plot, from Alkali Works to Comets and Cyclones, from Contentment and Education to the Crusades and Spontaneous Generation, affording a curious illustration of how a technical and apparently limited subject grasps deeply into many other branches of science and literature. The political economist will find here the fullest collection of tables ever made relating to mortality, to health and disease, and to casualties. He can glean from important articles on the Census and on Consols. He will find extensive tables of great fires (ninety pages), of famines, floods, hailstorms, and great frosts. He will have fifty-three pages concerning the curious English Gilds and 373 pages on Friendly Societies. The physician has long articles on Cholera, Consumption, Death, Disease, Fevers, Health, and so on. The ordinary encyclopædias repeat one another, and the new ones are often only the old made over; but Mr. Walford is here ploughing a new field, and turns up gems and curiosities without number.

The work was first announced in 1866, and the first volume published in 1871. The sixth volume is now in course of publication. As it begins early in the letter H, the work must be about half completed, and, if finished, will consist of ten or twelve volumes. The volumes are thick—having 600 to 700 pages each—and the print fine. It is one of the largest literary enterprises ever undertaken by a single person; for internal evidence indicates that it is almost entirely the work of the author alone. As in some other literary ventures, Mr. Walford, having misgivings about its reception in England, "had an abiding consolation" in his belief in its hearty reception on this side of the Atlantic. Here, he says, it will find countless thousands of readers; for here, in Insurance as in everything else, the fact is recognized that knowledge is power. After this gratifying tribute to us, one is rather pained to hit upon the article "Actuaries, Institute of (Great Britain)," and find that while in England no one is allowed to practise as actuary until he has taken, and passed examination in, a stiff three years' course of preparation, here he becomes an actuary when he can find a board of directors who will appoint him. There the actuary is made, here he seems to be born, like a poet. The author has evidently made an attempt to be as full as possible on American affairs. He has given an abstract of the insurance laws of each State, under the heading of the State, and has much American information, under general and special headings, scattered through the work. On the other hand, the information concerning France and Germany is collected under a single heading, each with about one hundred pages.

In so large a work, and one which will prove so useful that its owner can dispense with most other books on its topic, it seems ungenerous to point out trivial errors and defects. There is, however, a serious fault of omission affecting all the volumes which have appeared up to this time. Dealing as this Cyclopædia does entirely with subjects appertaining directly or indirectly to mathematics, one would at least expect to find it instructive under purely mathematical headings. To many consulting the book a single formula would often mean more than a page of explanation. If there is a formula in these five large volumes, we have failed to discover it. One of the things which the statistician has often to do, is to eliminate fluctuations from crude tables and get out the succession of numbers which most nearly represent the natural law involved. This is a particularly important process for actuaries, and they have been prolific in methods of doing it. One would expect, in a work of this character, that at least their methods would be given with sufficient fulness to enable one to employ them without going back to original authorities, and that the methods invented by other statisticians would be at least sketched out for comparison. Nothing of the sort is done, however. We have articles on "Adjustment," "Fluctuations," "Graduation," etc., with abundant quotations concerning the methods; but for the methods themselves we are left to go to the original sources, and these are often inaccessible to the ordinary student. The author is not strong on the mathematical part of his subject. In the various headings on "Averages," he is correct in the maritime and fire parts, so far as we can follow him. There it is question of law and customs; but in the parts relating to mathematical average he gives indications of different views in different articles, but with no hint that these views are not only unlike, but irreconcilable. He has general custom behind him, but this is no sufficient excuse, for his entire work is directly or indirectly concerned with averages. The list of authors under "Differential Calculus" is incomplete, and unsatisfactory otherwise. As if it were not enough to sin in omission in this part of the work, he also sins in commission. What connection have "Barycentric Calculus," "Binary Arithmetic," "Chinese Arithmetic" with the subject; and why should they be admitted even in brief when so much useful matter is omitted? Many of the mathematical articles are not without interest. For instance, under "Chances" and "Calculating Machines," we have important historical summaries. There is still time to correct the general defect of which we have spoken. Nearly everything desirable could be brought into the future volumes under Probabilities, or even under separate headings, with little loss of systematic regularity.

For those interested in insurance, in whatever capacity, these volumes will prove a treasure. The author enumerates sixty-four different genera of insurance, under each of which we may have more than one species. Besides the great business of marine, accident, fire, and life insurance, there are others which have been to a small extent, or might profitably be, introduced into this country. Among these are health, cattle, baggage, parcels, fidelity, hail, forest, weather, plate-glass, and steam-boiler insurance. There can be nothing objectionable to other forms if they are conducted on business principles. Among such are insurances relating to domestic changes and to the value of property. As, however, in this country at least, they are usually employed for "confidence" or speculative purposes, and conducted on swindling or gambling principles, public opinion is, very properly, against them. Many interesting details are given of the various bubble and gambling insurance projects. These have related to bargains, christenings, expected profits, personal adventure, captivity, mercantile profits, losses by servants, the price of stocks, female beauty, and many others, some of which decency forbids us to mention. We do not find any heading for "Graveyard Insurance." This can hardly be a Yankee invention, unknown to so erudite a man as Mr. Walford. The mortality tables are given in large numbers and *in extenso*. The practical part of the business is not neglected, and we have either suggestive notes or important articles, under such headings as "Advertising," "Accounts," "Amalgamation of Offices," etc. The history of important companies is given in some detail. To the "Equitable Society" are devoted nearly a hundred pages, to "Annuities" and "Government Annuitants" about as many more, to "Female Life" fifty pages, to "Bottomry" twenty pages. It seems that so far as mortality is concerned, the "Clergy" is the favored class—due probably to their comparative freedom from anxiety concerning matters here and hereafter, and to the regular lives which both their duties and their professions cause them to lead. The author gives the subject twenty pages. On the other hand, as is shown here, "Clerks" (meaning of the mercantile class) have a decidedly unfavorable mortality.

It is inherent in the nature of such a work that it should contain curious and rare bits of information in sufficient number to make it a mine of wealth to a Notes-and-Queries man or newspaper paragrapher. Apropos of the recent great fires and the unusual loss of life in some cases, and of the consequent flood of so-called inventions of fire-escapes, our author shows us that this field has been carefully tilled for a century or more, and is now about exhausted. His classification (borrowed from Brand) of fire-escapes into two classes—viz., those requiring the aid of outsiders, and those which can be worked, without aid, by the occupants of a burning building—might be supplemented by a third class

more important than the other two—viz., those fastened permanently to the building, as external ladders and balconies. Of the first class, the most useful are the telescoping ladders and the "shoots." The latter are usually of canvas, in which the velocity of fall can be regulated by spreading the elbows and knees, but to which the two objections apply that they are inflammable, and that the air offers obstruction to their movement from window to window. An attempt has been made to remedy these objections by making them of a network of copper wire in one case, and in another by a tube of iron with network compartments descending on an endless chain, the speed of which can be controlled. Of the second class there seems to be nothing on the whole better than a knotted rope or rope ladder with the means of fastening it to the window-sill. What is now wanted would seem to be not novel and ingenious fire-escapes, but the general adoption of a single form, or a few simple forms, with which both firemen and the public could become perfectly familiar by frequent public exhibitions and through the public prints. A person in imminent danger of death by fire is not in a fit condition to investigate a new and complicated fire-escape, though it might be well adapted to his wants if he knew how to use it.

It is not generally known that Babbage found so many centenarians that he was enabled to construct a centenary mortality table, the highest age in which is 150. The table was formed from 1,751 fairly authentic cases, the most of them from the last century. The perennial crop of newspaper centenarians has not even novelty to recommend it. It seems that marine insurance has a feline aspect. While a cat is alive on the ship, an old English law declares that the ship cannot be a "wreck." Besides, each captain is bound to have a cat on board a ship infested with rats. As it is stated that in 1871 London had 700,000 cats, it would seem that there would be no difficulty there in obtaining the fellow-voyager required by law. It appears that Cocker never saw the arithmetic on which his fame rests. It was published in 1677, the year of, but after, his death. The fortieth edition was published in 1723, and many editions have appeared since. Under "Family," we have a large number of interesting details. The most remarkable family recorded is that of an English bleacher named Pearson. He was married four times and had by each of his first three wives thirteen children, and by his last fourteen, making a total of fifty-three. Of polygamous marriages Mr. Walford gives the result in the case of a certain Kimball, whose administrators, according to their report, filed in 1869 in Salt Lake City, found forty-one children. But we refrain from going further, though the temptation is almost irresistible.

Linguistic Essays. By Carl Abel, Ph.D. London: Trübner & Co.; Boston: J. R. Osgood & Co. 1882. 8vo, pp. vii.–265.

In 1859, Dr. M. Lazarus, Professor of Psychology in the University of Bern, and Dr. H. Steinthal, Privat-docent of General Philology in the University of Berlin, issued a prospectus of a magazine entitled *Zeitschrift für Völkerpsychologie und Sprachwissenschaft*, which in due time was issued by the publishing-house of Ferd. Dümmler in Berlin. The chief object of the magazine was to discover and explain the psychological characteristics of the different races, nations, or peoples of the earth. The editors intended to lay the foundations, and proceed as far as possible in the construction, of a new science, which should investigate mental phenomena from a social instead of an individual point of view. To accomplish this, they announced their intention of laying under contribution everything relating to the history, manners, and customs, institutions, literature, art, science, and (above all, if not including all) language of each people. They maintained that the language of a people represents most fully and completely the view which that people takes of all things about which the mind of the people has concerned itself. In short, a complete knowledge of the language of a people carries with it a knowledge of all that people has been or is.

How far the editors succeeded in establishing and developing their new science it is not our purpose, nor is this the place, to inquire. They certainly succeeded in making a very interesting magazine, and among the contributors to it have been many of the ablest writers of Germany—philosophers, historians, jurists, critics in art and literature, and especially philologists. These "Linguistic Essays" of Dr. Abel were intended to form a contribution to the new science of *Völkerpsychologie*. But it would certainly be unjust to Messrs. Lazarus and Steinthal and their disciples to form a judgment of the methods and possibilities of the science from the work of Dr. Abel. It consists of ten essays, most of which have heretofore been communicated to the public through various channels. It is difficult to see for what reason the volume has been included in the "Oriental Series" of Trübner & Co. The thirty-odd volumes of that series which have already been published, with perhaps the single exception of Dr. Hahn's book on the religion and mythology of Southern Africa, have all been of a strictly Oriental character. But of the present volume, all, except a very small portion, has nothing specially Oriental about it. Much of it, however, is entertaining, ingenious, acute, suggestive, but not scientific.

In his first essay Dr. Abel compares the manner in which the French use their word *ami* and the Germans their corresponding word, *Freund*. This essay is interesting—sometimes even amusing; but it is evident that the writer has throughout been guided, perhaps unconsciously, by his preconceived notions of the differences in the character of the two nations. The second essay is entitled "The Conception of Love in Some Ancient and Modern Languages." The languages treated are the Latin, English, Hebrew, and Russian. Under the conception of love in English, for example, are included the emotions expressed by the words love, affection, charity, fondness, passion, liking, and attachment, and the meanings of all these words are elaborately discussed. But patriotism, friendship, philanthropy, and many others, might have been included with as much propriety as "charity." In an appendix to this essay Dr. Abel cites a large number of passages in support of his views from writers in the languages mentioned, each accompanied by an English translation. But the freedom of his translations often amounts to "perfect looseness." We would not assert that Dr. Abel has not a competent knowledge of Latin, Russian, and Hebrew, but certainly some of his translations from the Latin, if made by a Freshman, would receive a mark far below "max."

The third essay treats of "The English Verbs of Command"—to wit, the eleven verbs, command, order, enjoin, bid, ordain, decree, dictate, prescribe, direct, charge, and appoint. This is the longest essay in the book, and the distinctions between these words are discussed with much acuteness, and generally with correctness. But there is one great defect in their treatment which is more or less observable in almost all the other essays. Of the history of words either Dr. Abel knows little or does not care to make any use of what he knows. None of the words in question are traced to the roots from which they have sprung. Their original meanings, and the various ways in which those meanings have been modified, are nowhere pointed out, and yet it is precisely this knowledge which would seem to be of the highest importance, either in arriving at an exact comprehension of the meaning of the words, or in ascertaining what light they throw upon the workings of the English mind.

The limits of our space compel us to pass over several of the essays with a mere indication of their subjects. The fourth treats of "The Discrimination of Synonyms"; the fifth, "Of Philological Methods"; the sixth, of "The Connection between Dictionary and Grammar"; the seventh, of "The Possibility of a Common Literary Language for the Slav Nations," as to which Dr. Abel concludes that it can come about only by the general adoption of the Russian by the other Slav nations. We presume that no impartial observer will feel the least inclination to question this conclusion. Whether this result—manifestly the only one possible—is itself attainable, is a question which the future alone can solve. The eighth essay treats of "Coptic Intensification"; the ninth, of "The Origin of Language"; the tenth and last, of "The Order and Position of Words in the Latin Sentence." Discussions of the origin of language have of late years been regarded with great disfavor by philologists. The opinion is daily gaining ground that the time for grappling successfully with this question has not yet arrived. The historical development of written languages, and especially the organism of barbarous languages spoken by peoples who have not yet attained that stage of development which produces writing, must be much more carefully investigated than they have been, before any sound conclusions can be attained. Dr. Abel's essay is open to the same criticism to which all previous attempts are subject: they all proceed upon the express or implied assumption that at some time there have been communities of human beings essentially the same as ourselves, but destitute of language. No such people exists anywhere on the face of the earth, and there is not a particle of evidence, of the slightest scientific value, that any such people ever has existed. It is possible that Dr. Abel's essay may be of some utility in calling attention to the condition of language at that stage when writing begins to be developed; but the origin of language lies a long way back of this, and requires a far different course of studies.

Dr. Abel writes very good English, and much of his book will prove entertaining to the general reader. It may give some useful hints and suggest some subjects for profitable investigation even to philologists, but its positive contributions to science are of little account.

Das Land der Inca in seiner Bedeutung für die Urgeschichte der Sprache und Schrift. Von Rudolf Falb. Leipzig: J. J. Weber. 1883. 8vo, xxxvi. and 455 pages. Illustrated by woodcuts.

The promoter of the lunisolar theory of earthquakes, Rudolf Falb, originally a Styrian priest, is also the renewer of the exploded theory of an ancient ethnic connection between the Aryans and the Peruvians in race and form of speech. Nothing daunted by the unanimous condemnation of Lopez's unscientific Aryan-Kechua dictionary (1871) by competent critics, Falb attempts to reconstruct the oldest phonetic forms, which "were the common property of both stocks," in the dilettante publication whose title we give above. His knowledge of the Peruvian

languages is limited to a smattering of two dialects only—the Kechua and the Aimará; and, instead of studying first the numerous other Kechua dialects as a safe basis for a comparative grammar, he set himself to work comparing what he fancies to be their primordial forms with those of languages known to us from a period preceding by twenty or thirty centuries his two Peruvian dialects.

But let us look at the results. The reconstruction of the earliest sounds in the beginning of oral language is, according to Falb's theory, as follows (p. 306): From the earliest and primary sound, rh, were first evolved hva, ra, and dsa. From hva—a sound of paramount importance in Falb's system—were evolved ua, va, ga; from ra: la, ya; from the "spitting sound" dsa: da, sa. The further developments are as follows: from va came fa and wa; from the latter, ba, pa, ma; from ga originated the guttural sounds; from da: na, ta. Why the sonant mutes should be more ancient than the corresponding surd sounds, is just as enigmatic to us as why our author makes different sounds of hva, ua, and wa, which are *de facto* identical in all Indian languages. But the functions of his "primary syllable," hua (why not hva, as before ?), are still more wonderful, for he states (p. 162) that hua signifies any kind of radiation or indentation—hand, breath, star, rain; the reduplicated form huahua becomes *huara*, and from it is formed huarana, or, in contracted form, *huana*. These two are the great roots from which Falb's genius derives a stupendous array of words from the most disparate Aryan, Semitic, Egyptian, Basque, and Peruvian dialects, without paying any regard to their older forms as known to us. From *huara* spring χείρ, gêr, Wehr, aurum, aurora, fire, Feuer, vier, vir, parĕre, parare, puer; the Sanskrit terms kara (head), vara (man), from which our baron, varón, herus; Semitic words like or (light), barâ (to prepare), and the Aimará huarahuara, *star* and *red at dawn*. From huana Falb derives γονεία, generatio, sun and son (both being sa-huana, or "double huana"); sol (Lat.), which is sa-huala, the Kechua huano (excrement, manure), the Aimará kauna (egg), the Chinese man (lance), and a Tatar and a Basque word to boot. Readers not satisfied with this brilliant array of erudition will be gratified, in reading further, to learn that there is a connection between the Kechua words cacha, *salt*, and cocha, *ocean*, and that θάλαττα is the radix of salt and Selters-water (p. 8).

Exactly the same sort of chaff is contained in the archæological and ethnographic portions of the volume, both of which are thickly interspersed with the peculiar linguistic views of the author. A profusion of elaborate sculptures referring to ancient worship render the gate of Tiahuanaco (near Lake Titicaca) the most important architectural monument of these countries. One of these carvings, the "Weeping Sungod," holds in his right hand a sceptre-shaped object resembling a capital Y. Falb regards it as a double snake and as a bundle of lightnings (p. 48, etc.), thinking that it was meant for the "sickle of death," because in Sanskrit we should call it *suna*, weapon of death. He is very liberal in giving us various etymologies of the name Tiahuanaco, which has evidently had some mystic attraction for the investigator, judging from the great number of passages devoted to it. He explains it on p. 51 by seat of death; on p. 205 by cave of the treasure, *or* cavern-treasure; on p. 233 by seat of the phœnix *or* of the Phœnician; seat of the procreator, seat of primitive man, of the wild man; finally, by seat of the rabbit.

The above extracts will give a general idea of one of a too numerous class of works which encumber the book-market, to the great detriment of genuine scientific publications.

An Anglo-Saxon Dictionary, based on the Manuscript Collections of the late Joseph Bosworth, D.D., etc. Edited and enlarged by T. Northcote Toller, M.A., late Fellow of Christ's College, Cambridge, and Smith Professor of English in the Owens College, Manchester. Oxford: At the Clarendon Press; London: Henry Frowde. 1882. Parts 1 and 2. A–Hwi.

TOLLER'S edition of Bosworth's Anglo-Saxon Dictionary is a useful book. In the present state of Anglo-Saxon lexicography, indeed, it is indispensable to all students of that language; but it is a great disappointment, nevertheless. Those who knew Bosworth's work knew, of course, that he would have no adequate materials for a comprehensive scientific dictionary. But there is the most urgent need of a good manual for general readers and for academic use. All our good colleges, and many academies, have classes in Anglo-Saxon, and yet there is no dictionary accessible; for Bosworth's 'Compendious Dictionary' does not deserve the name.

Bosworth, if no scientific philologist, was an enthusiastic and indefatigable worker in Anglo-Saxon, and it was hoped that he had left material which a competent editor might work over into a good handbook for general use. But this book has the bulk and cost of a philological reference-dictionary. The contents are open to the criticism which has been so freely dealt out to Bosworth for want of critical spirit and scientific mastery of his material. The articles in this book look like an undigested mass of Bosworth heaped with unassimilated layers of Grein. But it improves as it goes on; and it will answer a good purpose till Mr. Sweet, or Prof. Skeat, or some of the young Germans or Americans who are now devoting themselves to English studies, make us a dictionary which is a dictionary, and find a publisher for it.

On the Desert,

With a Brief Review of Recent Events in Egypt.

By Rev. HENRY M. FIELD, D.D.,

Author of 'From the Lakes of Killarney to the Golden Horn,' and 'Egypt to Japan.'

1 vol. crown 8vo, with a map, $2.

An account of a journey in the track of the Israelites along the Red Sea, among the peaks of Sinai, through the Desert of the Wandering, and up to the Promised Land.

"There is not an uninteresting chapter in the book. It is entertaining throughout. It depicts men and countries in a picturesque and thoughtful manner, and is likely to meet with as much favor as the author's former capital books on travel."—*New York Herald.*

"These notes of travel recount precisely what the average reader desires to hear, and the narrative is put together with much literary skill. Dr. Field has unquestionably given us an entertaining book. W[illegible]nk his account of the revolution suppressed at Tel-e[illegible] and of the relation of England to that movement, [illegible] most intelligible, impartial, and satisfactory that we have seen in print."—*New York Sun.*

"Rev. T. W. Chambers, D.D., of New York, who some years since made the journey across the Desert to Mount Sinai, writes: 'Those who have been over the ground will bear witness to the author's literal accuracy. The reader will get a better idea of the real characteristics of the Sinaitic Desert and its inhabitants from these pages than from any other accessible volume.'"—*Christian Intelligencer.*

"No books of travel have ever so fascinated me as those of Dr. H. M. Field."—*Dr. Howard Crosby.*

"I found it so interesting I could not lay it down until I had finished it."—*Canon Farrar.*

"Two such travellers as Dr. Field and Dr. Post very rarely turn up, either together or separately. They ran a great risk in going through the long Desert as they did. But this only enhances the interest of the volume. It is at once very entertaining and very instructive. Dr. Field has surpassed himself."—*Prof. Roswell D. Hitchcock, D.D., LL.D.*

"Dr. Henry M. Field, for so many years editor of the *Evangelist*, is also a right famous traveller. There have been other tourists who could give quite as piquant an account of personal experiences and adventures in foreign lands, but the number of those who combine with this picturesque and realistic narrative so much of the most pertinent and instructive information, is rare indeed."—*Advance, Chicago.*

"Dr. Henry M. Field, editor of the N. Y. *Evangelist*, adds to his well-wrought books of travel 'On the Desert,' a portfolio of sketches taken on the camel's back or at the tent-door. . . . A thoughtful student of the literature and history adjacent to his themes, he interfuses just enough of such knowledge into his itinerary to lend it stimulating interest, without detracting from the vivacious, good-humored, and pictorial charm of his pen."—*Springfield Republican.*

"There are fine passages in the writing that cannot be overlooked. Poems in prose look out of these pages, and are easily read and fully enjoyed. His meditations at Sinai, his discussion of the Hebrew commonwealth and its peculiarities, his perils among robbers, his way through the great and terrible wilderness, his visit to Bethlehem—in fact, every part of this narrative, is so attractive and so skilfully and effectively presented in these pages that we give to this volume the heartiest greeting and warmest commendation. It ought to be in every Sunday-school library and on every home table. The minister's library need not disdain it. We hope Dr. Field will live long, travel much, never fail to make abundant notes, and give them, with subsequent reflections, in volumes that will be sure to prolong his usefulness and the gathered treasures of many days. Books of travel like these preach powerfully both of the ways of man and the ways of God."—*Christian Union.*

CHARLES SCRIBNER'S SONS,
743 and 745 Broadway, New York.

Washington Irving.

The centenary anniversary of Irving's birth will direct renewed attention to his writings, of which it has justly been said that they are "the delight of childhood, the chivalric companion of refined womanhood, the solace of life at every period, an imperishable legacy of grace and beauty to his countrymen." These comprise: Bracebridge Hall, Wolfert's Roost, Sketch-Book, Traveller, Knickerbocker, Crayon Miscellany, Goldsmith, Alhambra, Columbus, Astoria, Bonneville, Mahomet, Granada, Salmagundi, Spanish Papers, Washington, Life and Letters.

THE GEOFFREY CRAYON EDITION. 27 vols. square 8vo, fully illustrated, per vol., $3; per set, $75.

THE HUDSON EDITION. 27 vols. crown 8vo, illustrated, per vol., $1 75; per set, $45.

THE PEOPLE'S EDITION. 16mo, per vol., $1; per set, $26.

THE SPUYTEN DUYVIL EDITION. 24 vols., bound in 12, sold only in sets, cloth, $20; [illegible] bound, $25.

[illegible]IGHTER WORKS. 8 vols., half bound,

THE STR[illegible]ORD EDITION of the more popular works. 4 vols. 8vo, illustrated, $5.

THE LIFE OF WASHINGTON. New Centennial Edition. Large 4to, illustrated (nearly ready), about $1 25.

THE SKETCH-BOOK. New Popular Edition. Crown 8vo, illustrated, $1.

NOTE.—With reference to the recent issue of some unauthorized and incomplete editions of the Sketch-Book, and some unauthorized reprints from first editions of portions of other of Irving's earlier works, it is proper to say that the editions of our house are the only ones that contain the complete material and the author's latest revisions.

LETTERS AND MEMORIALS

OF

Jane Welsh Carlyle.

Prepared for Publication by THOMAS CARLYLE.

Edited by JAMES ANTHONY FROUDE.

Two Vols. With Portrait, . . $4.

Public interest in the married life of Thomas Carlyle has been stimulated to a high pitch by the revelations of the 'Reminiscences' and Mr. Froude's biography, but it is to be still further gratified by the 'Letters and Memorials of Mrs. Carlyle,' which her husband annotated and arranged for publication many years ago, and which are now issued under Mr. Froude's editorial supervision. These letters, however, as the readers of the 'Reminiscences' were led to expect, possess a much higher interest and charm than as a mere disclosure of the daily life and habits of the Carlyles. They contain the records of the life and associations of one of the most sensitive and brilliant of women.

Many of the letters are to Stirling and other literary men, whom Carlyle's influence and genius brought around him, but the majority are to Carlyle himself during their frequent separations. Every sentence is sharply cut and stamped with the impress of a strong individuality—displaying a keen, bright, affectionate nature—gay, witty, sarcastic, tender, pathetic, passionate by turns. They are such letters as only a woman could write, and they form a picture which, for graphic power, strong human interest, tragic intensity, and self-effacing devotion, it would be hard to match in all the annals of literature.

The Nation.

NEW YORK, THURSDAY, APRIL 12, 1883.

The Week.

THE appointment of Judge Walter Q. Gresham, of Indiana, as Postmaster-General, has been received with no little satisfaction by the public, partly on account of its inherent merit, and partly because it entirely dispels the fears, entertained by some, of much worse things that might have happened. Mr. Gresham has been a patriotic and brave soldier and a good judge; and as a politician he has not belonged to the class of narrow-minded, hide-bound partisans. He has had but little, if any, opportunity to prove his administrative capacity, but it may be taken for granted that he will take hold of the business of the Department which he is to conduct, with a firm determination to have it honestly and efficiently done. The appointment reflects credit upon the President. And if it is true, as reported, that Mr. New, one of the Assistant Secretaries of the Treasury, and Mr. Hatton, the well-known Assistant Postmaster-General, are dissatisfied with it—the former, as an Indiana man, because it shuts him out from a Cabinet appointment for which he is ambitious, and the latter because he would have liked to be Postmaster-General himself—this circumstance will not disturb the general contentment. On the contrary, it is hoped that Mr. Hatton will not be permitted to play such pranks under Postmaster-General Gresham as he did under Postmaster-General Howe.

The State election in Rhode Island on Wednesday resulted in the defeat of the combined Democrats and Independents, under the lead of ex-Senator Sprague, by a considerable majority—considerable at least for Rhode Island. This result will be generally regarded as a defeat for General Butler, who appeared on the scene as ex-Senator Sprague's main champion, for the purpose, as was widely reported and believed, of securing for himself the Rhode Island delegation in the next National Convention of the Democratic party. The morning papers publish a declaration from General Butler, emphatically denying that he is a candidate for the Presidency. This denial will not meet with as much incredulity now as it would have done last week. He is, however, working hard to recover some of the ground he has recently lost, by the investigation of certain abuses in the management of the Tewkesbury Almshouse, the outcome of which threatens to be quite sensational. No greater mistake could be made by the Investigating Committee of the Legislature than to permit itself to be put in the attitude of defending the abuses against the charges made by the Governor. If any abuses exist, the Legislative Committee should show such zeal in exposing them, with a view to their correction, as to make all outside stimulus appear superfluous.

Governor Butler defends himself against the very severe strictures which the clergy have been making on his Fast-Day proclamation, by announcing that he played them something in the nature of a trick by taking as his model a proclamation issued by one of his predecessors in 1810; but admits that he inserted the warning against preaching on political topics, which in 1810 would not have been necessary, because the clergy avoided such topics at that time. We suspect he is greatly mistaken on this point. The Massachusetts ministers were great politicians from the beginning down to 1810 and later, and one result of their political activity was the absence of Butler. His growth would have been impossible when they were in their heyday, or, if he had appeared, he certainly would have caught it in a way of which the sermons last Fast Day give but little idea. The Massachusetts ministers, indeed, as everybody knows who has perused any of their sermons about Jefferson, the Democrats, or the French Revolution, were not mealy-mouthed in old times in talking about such a son of Belial as Butler would have seemed to them to be at any period, and as he undoubtedly is. Nobody, in any age, who looks at him from an ecclesiastical point of view, and feels bound to characterize him, can avoid using language of great strength.

Last week we recorded the removal of General Trowbridge from the office of Collector of Internal Revenue at Detroit, Michigan, as one of the most glaring and inexcusable violations of all sound civil-service principles on the part of the Administration. A Detroit paper now publishes the correspondence between General Trowbridge and General Green B. Raum, the Commissioner of Internal Revenue, which preceded the removal, and puts the arbitrary character of the latter in the strongest light. On March 21 Mr. Raum telegraphed to General Trowbridge: "I am directed by the President to inform you that he has concluded to ask you to send in your resignation as Collector of Internal Revenue. Please reply to me by telegraph to-day." General Trowbridge promptly answered this curt message by saying that while he entertained the highest respect for the President, he declined to comply with the request for his resignation, and would give his reasons in full by letter. But Mr. Raum could not wait for those reasons. He forthwith telegraphed to General Trowbridge: "I regret your declination, and hope you will at once reconsider it and telegraph your resignation on receipt of this date." But General Trowbridge declined again, saying that he was not conscious of any act that would justify a demand for his resignation; that he had "served the Government faithfully in war and in peace," and that he was "unwilling to leave that service under the implied appearance of a forced resignation." And in the letter giving his reasons more fully he modestly but firmly declined again to resign, and then added: "During my administration I have received from you the most flattering commendations, and have been told that my office was second to none in the country in point of efficiency and good management. On the other hand, my administration has been such as to receive the unqualified endorsement of the entire body of the taxpayers who had business with the office. With a unanimity truly surprising, they have protested against any change in this office. There is, therefore, no reason connected with the public service why I should resign, at least so far as I know." Neither General Raum nor President Arthur could say in reply that there was any such reason. But General Trowbridge was simply removed and a favorite of Senator Conger put in his place.

A report of the Assembly Committee on Public Education—the only report, it is said, which that Committee has made this year—recommends the following important and encouraging bill:

> "Any person who shall sell, loan, or give to any minor under sixteen years of age any dime-novel or book of fiction, without first obtaining the written consent of the parent or guardian of such minor, shall be deemed guilty of a misdemeanor, punishable by imprisonment or by a fine not to exceed fifty dollars."

The determination shown in this to arrest not only the sale, but the reading, not simply of pernicious literature, but of all fiction, among the young of both sexes, proves that there are probably far more friends of virtue in the Assembly than the public has been in the habit of supposing. The author of the report is Mr. Abel Goddard, of St. Lawrence County, a gentleman hitherto little known, but, unless all the usual signs of greatness are deceptive, destined to fill a large place in American history. He is just the kind of man of whom the new school of historians, like Green and McMaster, will make much, and with good reason. What we like most in the bill is the evidence it affords that Mr. Goddard himself is a man of serious tastes, who reads for mental discipline, rather than to kill time, as most readers, we fear, do. There are, we fancy, not many persons among us whose acquaintance with the literature of fiction is as meritoriously slight as his seems to be. He is evidently under the impression that the term "dime novel" is a generic name, and covers all tales. Hence his stringent but healthy provision for putting anybody in jail who lends "Ivanhoe" or "Robinson Crusoe" to a boy of sixteen without receiving a written request to do so from the youth's papa or mamma. Indeed, it looks as if fiction and liquor were mixed in Mr. Goddard's mind in a vague way, as synonymous terms.

The keen competition of the law continually produces ingenious novel devices for getting the better of an antagonist. According to the *Legal Adviser* of Chicago, the lawyers of that city have got what is regarded as a "new racket," viz.:

> "when the lawyer for the plaintiff is making his closing speech, to constantly interrupt the speaker, and protest both as to the line of argument and language made use of, and demanding of the Court to rule both as to the fitness and propriety of the argument and the correctness of the statements made, whatever they are, and

excepting to the rulings of the judge and making up a bill of exceptions and taking the case up on such exceptions."

This seems to be a very neat way of trying the whole case twice over; but it must have a bad effect on forensic eloquence. We doubt if the greatest orators at the bar the world has ever produced would be able to do themselves any justice in addressing the jury, if such a "racket" were to become a recognized part of a trial. An impassioned appeal to the feelings, for instance, in a murder or breach-of-promise case, continually interrupted by disputes over its fitness and propriety, and by requests to the judge to "note an exception," would lose much of its effect. All the traditions of the profession, from the days of Cicero to those of Howe & Hummel, seem to be opposed to this new "racket."

The showing of the Augustinian Fathers in Massachusetts of the results of their savings bank operations is very melancholy reading. Their liabilities to their depositors are, they say, $455,000. This sum, with a mortgage of $60,000, has been put into four parsonages, churches, and schools, which are called the "assets," and are valued at $569,000; but it is admitted that if sold now they would not bring $28,450, or five per cent. of the total debt. It is rather difficult to understand the state of mind of the Fathers when disposing of the poor people's money in this way. It is impossible to believe that it was one of pure recklessness, and that as long as they got the money into churches they did not care what became of the depositors. We incline to believe that, if the truth were known, the Fathers would be found to have been the victims of that great and curious delusion about "basing," which had so much to do with diffusing the greenback craze after the war. The Greenbackers have always maintained that as long as promissory notes were "based" on tangible property, you might issue any amount of them whatever; that, for instance, you might issue an amount equal in nominal value to the real value of all the property in the country, and they would then be "based" on the property. If you asked them what they meant by "based," they would say that they were issued "against the property," or that the property was "there" to meet them, but would always admit that you could not exchange them for the property, or any part of it, so that the "basing" really established no connection, except in the mind of the holder, between the paper money and anything else in the world. The "basing" idea probably got hold of the Fathers, and they thought that as the churches and parsonages were there, the claims of the depositors were "based" on them, and so all was right.

International "events" like the late balk-line billiard tournament for the championship of the world would be more impressive and interesting to the nations concerned if they were not so frequently and indeed customarily followed by charges of "fraud." There seems to be no real reason for doubting the fairness of the game in which Vignaux was defeated by Schaefer; but Vignaux was playing in a foreign country, and watched by a foreign audience, and besides this he was beaten. According to all precedent, this is quite enough as a foundation for the gravest charges. Owing to the fact that with nine-tenths of sporting men sport is entirely a matter of dollars and cents, what may be called the business view of an international contest must be very prevalent. One of the correspondents writing about Vignaux and Schaefer remarks that the contest was so close that "either player by selling the game could have made himself comfortable for life"—much as if a transaction of this sort was an every-day occurrence among champions, and that therefore the sense of honor shown by Schaefer and Vignaux in not making a "deal" was little less than sublime. Every country will doubtless in the long run take most pride and interest in those of its champions who refrain from selling their games.

Fine weather at the West has made an improvement in crop prospects, especially for winter wheat, though the general condition of that crop, as shown by the United States Agricultural Bureau report on Tuesday, the 10th instant, is below that of last year. Reports from the West also show that the seeding of spring wheat has made good progress, and that the area this year will be largely increased over last year's. Large numbers of immigrants are already moving into Minnesota, Dakota, Nebraska, and Northern Texas, and the general aspect of trade and industrial affairs at the West is very encouraging. Within the past week the money market has become decidedly easier, and rates for discount of mercantile paper have declined one-half per cent. Easier money has enabled merchants to remit on foreign account, and rates of foreign exchange have advanced about 2 cents on the pound. There has been an increased demand for investment in railroad bonds, which have advanced from 1 to 4 per cent. The greater part of this investment has been of a speculative character, in bonds which are below par, and the future of which depends on the prospective business of the railroads issuing them. Within the past few days the speculative disposition above mentioned has apparently extended to railroad stocks. Monday was the most active day in the stock market thus far this year. The general advance of prices of stocks in the past week has been from 1 to 5 per cent. Those which have advanced the most have been Burlington and Quincy, Milwaukee and St. Paul, Louisville and Nashville, Delaware, Lackawanna and Western, Union Pacific, Central Pacific, Missouri Pacific, and Lake Shore.

The British budget for 1883 shows the financial condition of the Empire to be extremely satisfactory, notwithstanding the strain put upon its resources by the war in Egypt, the disturbed condition of Ireland, and the arrearages incurred under the Beaconsfield Government. The national debt has been reduced during the year by about £7,100,000, and a further reduction of £8,000,000 is expected this year. The Chancellor of the Exchequer, Mr. Childers, said that the debt, which is now £762,000,000, might be reduced £172,000,000 during the next twenty years without difficulty. The revenue for the year was £89,000,000, and the expenditure, including debt reduction, £88,900,000. The expenditure on account of the Egyptian campaign was £3,896,000. The Chancellor proposed sundry reductions of taxation, the most important of which was a reduction of the income tax by three half-pence. He also thought that the charge for telegrams within the United Kingdom might be reduced to sixpence—the existing rate being one shilling for twenty words, counting the address and signature. The report was received by the House of Commons "with loud and prolonged cheers"—which is not surprising when we reflect upon the great deficit left by the Tory administration as the result of its "spirited foreign policy" in Turkey, Afghanistan, and South Africa. The most significant part of Mr. Childers's showing is that which looks toward the eventual payment and extinction of the national debt. The example of the United States has had a great and beneficial influence upon the mother country in this behalf. The fact that American 3 per cents sell higher than British 3s was commented upon by the *Economist* lately as a phenomenon which could only be ascribed to the persistent debt-paying policy of the United States.

The nitro-glycerine discoveries in England are very startling, and may well alarm people, and cause much doubling of guards and patrols and great detective activity. But then the facility with which, apparently, the explosive factories are discovered shows what difficulties the laborers in this field have to contend with, and indicates, perhaps, that the world is unnecessarily frightened by them. Nothing is easier than to hire a house and begin compounding dynamite in it, but the dynamite in the factory is of no use to the conspirators. It has to be transported considerable distances in order to serve their purpose, and is a very ticklish thing to transport even in small quantities, and a quantity of it large enough to do real execution is large enough to attract attention. It has, moreover, in order to terrify tyrants thoroughly, to be placed in or rather under their lairs, so that when it explodes it may rend the building completely, like the explosion in the cellar of the Winter Palace; but it is no easy matter to get a snug keg or can of dynamite into a tyrant's basement and explode it without damage to the conspirator himself. Most of the Fenian attempts in England have failed. The two successful ones—that at the Clerkenwell Prison and that the other day in Westminster—were poor affairs, owing to the explosive having been placed outside in the street and in small quantity. The quantity was small, doubtless, because it was all a man could carry without attracting notice, and because a large quantity would be liable to concussions or other accidents which would convert the patriot carrying it into vapor.

What the dynamite party now need is resolute men, willing to sacrifice themselves in the cause of liberty. Their explosives have apparently nearly reached perfection; all that is now wanting is people to touch them off who

do not object to being blown up themselves. Such men could carry dynamite anywhere. They could rush into the Houses of Parliament or into the Home Office, with their pockets full of it, before any one suspected or could stop them, and apply the match or electric spark, or whatever it is, the minute a policeman touched them; and the result would be a vacant lot on which St. Stephen's once stood. In other words, the great difficulty in the way of the dynamite reform is the old one, which has always stood in the way of so much evil and so much good—the unwillingness of men to face certain death. Men willing to run great risks abound everywhere. Volunteers for the most desperate forlorn hope can always be had for the asking, but to get them there must always be a chance that at least one man will escape. The dynamite war, if carried on effectively, would offer no such chance. Anybody who goes into a basement with a can of nitro-glycerine and personally superintends its operation as a liberator of the oppressed, is sure not to see the fruits of his toil. The Russian Nihilists are apparently not far from being able to command the services of such desperadoes, but they are only possible under a régime of such extreme repression as exists in Russia. In countries in which speech is free, such types rarely show themselves, no matter how great the popular discontent may be. It is silent or secret brooding which produces the real political fanatic or martyr. When the malcontent can publicly fume, and rave, and threaten, as he does in England and France and in this country, he hardly ever makes up his mind to much personal sacrifice in the cause. He enjoys talking to the reporters, and being described and pointed out as the implacable enemy of kings and capitalists, too much to be willing to quit a world in which notoriety can be had so cheaply.

The promptness with which Sir William Harcourt's Explosives Bill was passed in Parliament, the cheers with which it was greeted, and the rapidity with which it obtained the royal assent, show how deeply the public mind has been stirred not simply by the explosion at Westminster, but by the discoveries of the police at Birmingham. It was certainly high time for some such legislation, as the previous penalty for keeping or preparing explosives without a license was only two years' imprisonment, and was intended merely to be a preventive of accidents. Michael Davitt has again raised his voice against the dynamite policy, but neither his protests nor those of Mr. Sullivan, or in fact of anybody in England or Ireland, seem to produce any impression on the Irish agitators here. As far as one can judge from their public expressions, they are highly delighted with the panic created by the conspirators in England, and we have no doubt this feeling exists among thousands of the Irish who would not join in the dynamite conspiracy, or give money for explosives. They like to see the English scared and made uncomfortable, especially if it can be done without loss of life or destruction of property; but they like to see it in any case, and believe that in this way the British public will eventually be prepared for the concession of Home Rule or Irish independence. For the inconvenience, loss, suffering or danger which the dynamite policy may entail on the Irish in England, of course they care nothing.

Another split is impending in the French Ministry, which appears to be the result of getting General Thibaudin into it. His appearance on the scene as Minister of War, after his conduct in 1871, was a national disgrace, but this was not all. His breaking his parole, and the excuse he gave for it—that his "patriotic blood boiled"—showed him to be a good deal of a demagogue, and with much capacity for giving trouble. He has, accordingly, apparently been more occupied since his accession to office with pursuing the Orleanist Princes than with improving the discipline or organization of the Army, and has, in fact, apparently made himself the organ in the Cabinet of the extreme Radicals in the Chambers, to whom, like our Stalwarts, the first and greatest political interest is the expulsion from office of everybody who does not agree with them. General Thibaudin's success in getting the Orleanists put on the retired list has emboldened him into making an attack on the Marquis de Gallifet, who is, and with more reason, another great object of Radical dislike. Gallifet is not simply the best cavalry officer in France, but by far the best—probably the only one who can manœuvre cavalry on a great scale; and if war broke out to-morrow would be simply invaluable in the present dearth of military talent in France. But he was an Imperialist, though he cares very little for politics, and—which makes him most obnoxious to the Paris Reds—was very prominent and remorseless in putting down the Commune. He shot hundreds whom he caught in arms, and made himself terrible to the Belleville people. They therefore hate him with a deadly hatred, and their hatred, working upwards, takes in the Chamber the form of a strong desire to get him out of the Army, or, at all events, out of high command. But it is clear that if this chase after prominent military men is continued, a profound dislike and distrust of the Republic is likely to spread through the Army. The frequency with which these dissensions break out among the Ministry shows the difficulty of making what may be called "scratch" Cabinets—that is, Cabinets composed not of men long accustomed to act together, but of such materials as may on any given day happen to come to hand.

The malcontents in Jamaica appear to have succeeded so far as to secure the removal of the Governor, Sir Anthony Musgrave, who is to be sent to Queensland. But they have lost the last shred of popular government. The people had some representatives in the Governor's Council who, when the recent difficulties began, tried to paralyze him by absenting themselves. An Order in Council of the Home Government now provides that any three official members of the Governor's Council may legislate on all matters without the presence of any elected members. As Sir Anthony Musgrave goes to a post bringing less salary, it looks as if the change carried with it some disapproval; but Jamaica is probably more highly paid than Queensland, both because it is a Crown Colony and because the climate is bad.

The swiftness of English justice, especially in murder cases, has long been an object of envy and admiration on this side of the water to those who think that punishment, to be effective, should be prompt. It is not often that in England more than two months elapse between the capture of a murderer and his execution, if convicted. Sometimes he is hanged within a month of his capture, and within a fortnight of his conviction. With us it is difficult to get a murderer hanged within two years of his capture. He often has a longer day than this even, and but very rarely a shorter one. He seldom goes to the gallows without at least two formal trials, for he always appeals on some point of law, if convicted. The appeal, if it does nothing else for him, prolongs his life, and for this reason alone his lawyer always advises it. There are, however, a good many chances that the delay will make a second trial abortive, or secure, at the worst, a commutation of his sentence. Within a year, important witnesses may die, and, even if they do not, the mere flight of time diminishes the popular indignation over the crime and the popular desire for vengeance, and in this way disposes the minds of the jurymen toward clemency. After a year or two, also, Governors become less stern, and the number of influential persons ready to sign petitions for commutation greatly increases. In other words, delay is very apt to transfer a considerable share of the popular pity from the murdered man and his family to the murderer and his family. It is to the uncertainty thus created in nearly every State in the Union that we owe much of the alarming frequency of homicide, and the steady increase of unpunished homicide, and the growing readiness to resort to the pistol and knife, which is now the disgrace of our civilization.

In England there is no appeal in criminal cases, unless the judge thinks the points raised by the defence worthy of consideration by the full bench. In that case he "reserves" them, and they are argued before several judges, and, if sustained, a new trial is ordered. But a point has to be a very strong one indeed, and one from which the prisoner has really suffered some damage, to procure its reservation in this way, and the consequence is that it is but seldom that the prisoner can get to the court above. The feeling, however, that appeal ought not to be a privilege dependent on the consent of the judge who tries the case, has been growing for some years, and has at last led to the introduction of a bill into the House of Commons, which has now reached its second reading, giving criminals in capital cases an appeal as a matter of right. It is not, and cannot be, alleged that the judge's discretion has often been abused, and the swiftness of justice in such cases is generally recognized as most valuable to the community. But the humanitarian sentiment of the day will no longer allow any man's chance of life to be dependent on the opinions of a single judge, whose temper may have been roused against him by contact with him during the trial.

SUMMARY OF THE WEEK'S NEWS.

[Wednesday, April 4, to Tuesday, April 10, 1883, inclusive.]

DOMESTIC.

President Arthur on Wednesday nominated Walter Q. Gresham, of Indiana, to be Postmaster-General. The nomination was a general surprise, and has met with warm approbation from many sources. Mr. Gresham was born in Indiana, in 1833. He was an aggressive Union man in the Legislature of that State at the outbreak of the war. In the army his career was brilliant and his promotion rapid. He was brevetted Major-General in 1864 for gallant services. He resumed the practice of law after the war, and in 1869 was made United States District Judge for Indiana, and holds that position at the present time. In 1872 he sympathized with the Liberal movement. In 1880 he favored Grant for a third term, but afterward warmly supported Garfield, who would have given him a place in his Cabinet but for local jealousies.

About noon on Thursday President Arthur, with Secretary Chandler, Private Secretary Phillips, and a New York friend started from Washington in a special car for Florida. He arrived at Orlando, Fla., on Monday, and that evening took a boat from Kissimmee City for an island, where he will engage in fishing.

United States Treasurer Wyman has promoted Thomas E. Rodgers, financial bookkeeper in the Redemption Division, to be Superintendent of that division, in place of E. O. Graves, promoted to be Assistant Treasurer. This appointment is a recognition of civil-service principles by Mr. Wyman. Mr. Rodgers entered the service, almost unknown, as a subordinate clerk. He speedily developed remarkable skill at figures and good organizing ability, and has lately been eminent as chief financial bookkeeper.

Mr. Richard Crowley, of New York, has resigned his position as special assistant counsel for the United States in the prosecution of alleged election-fraud cases in South Carolina. The resignation is said to be connected with a recent heavy bill presented by Mr. Crowley for special services as Government attorney, which was cut down by Attorney-General Brewster. Another report is that he has quarrelled with President Arthur.

Lieutenant Raymond P. Rodgers, United States Navy, who was directed by Rear-Admiral Cooper, commanding the North Atlantic Station, to pass over the line of the Panama Canal and examine its general plans, its conditions, and prospects, has made his report. He believes that there can no longer be any doubt of the intention of the company to carry out their project; that it can be accomplished for the amount estimated, $120,000,000, but will probably cost more, and will not be finished for several years after the contemplated date—1888.

The *Jeannette* Court of Inquiry reconvened on Friday morning, and it was announced that thirty-five questions had been received from Dr. Collins in regard to the treatment of his brother. Fireman Bartlett testified that Mr. Collins was treated with all due respect by the officers and crew of the *Jeannette*. He had heard him say that he (Collins) was prevented from saving his papers when the ship was lost. Nothing damaging to the officers of the ship was elicited from the witness.

Consul Taintor, at Liége, has sent to the State Department at Washington a very remarkable report on adulterations of American goods and of German products in Germany and Austria. He asserts that nearly all articles exported from Germany are adulterated, and American petroleum is subjected to a similar process.

General Crook will make an aggressive campaign in Arizona, with a view of carrying out Secretary Teller's idea of wiping out Juh's troublesome band of Indians.

Brigadier-General Joseph K. Barnes, retired, Surgeon-General of the Army from 1864 to 1882, died at his residence in Washington on Thursday. He was one of President Garfield's physicians, and the constant attendance told upon his health.

In the Star-route trial on Wednesday, Harvey M. Vaile, one of the defendants, was called to the witness-stand, and examined by his counsel, Mr. Henkle. He testified as to his relations with Miner, Peck, and John Dorsey. The witness denied, positively, the whole conversation at the National Hotel, as described by Rerdell. Vaile was cross-examined on Thursday, and explained that he was magnanimous to Miner, because he did not wish to crush him, and that he did not wish to take advantage of the Government. John Dorsey, brother of the ex-Senator, testified on Friday. John R. Miner, another of the defendants, testified on Monday and Tuesday.

Senator Don Cameron, of Pennsylvania, will soon go to Europe for a health trip. There are speculations as to whether he will be called upon to resign his Senatorship for a seat in the Cabinet on his return.

The Everhart Anti-Free-Pass Bill finally passed the Pennsylvania Senate on Wednesday.

There was an unusually heavy vote in the Rhode Island State election on Wednesday—Sprague, the Independent-Democratic candidate, was badly defeated, the plurality of Bourn, Republican, being about 2,800. The Republican strength in the new General Assembly will be about the same as last year.

After two years' agitation of the temperance question the Ohio Legislature has agreed on two amendments to the Constitution to be submitted to the people, either of which may be adopted or rejected. The one provides for the regulation of the liquor traffic by the Legislature, its power to levy taxes being unlimited. The other absolutely prohibits the manufacture of or traffic in intoxicating liquors.

At Albany, on Wednesday, an important caucus of Republican Assemblymen was held. They resolved to make a party question of the New York charter, and oppose it in its latest phase. Similar action was taken in regard to the primary-election bills applicable to the State and city. The proposed constitutional amendment, prohibiting the manufacture and sale of intoxicating liquors, met its death in the Assembly on that day. The Judiciary Committee, having held it as long as its introducer, Mr. Page, thought proper, he moved to discharge that Committee from its consideration in order to bring it into Committee of the Whole. A motion was made to lay it on the table, which was carried by a vote of 53 to 39, only three Republicans voting in the affirmative. The bill making the time of New York the standard time throughout the State was lost. The Senate agreed to adverse reports on several prison bills, showing their disposition to permit no disturbance of the existing prison laws. In executive session, on Thursday, the Senate confirmed the nomination of Isaac G. Perry for Capitol Commissioner. There was only one negative vote. A bill was introduced in the Senate on that day to prevent any attempt to represent any being recognized as a divinity in the Bible by any show, play, or dramatic representation, under penalty of a fine of from $500 to $2,000, or imprisonment for not less than six months nor more than one year. It has been favorably reported, and passed to a third reading. In the Assembly on Thursday the Sunday-Law amendments to the Penal Code were passed by a vote of 87 to 14. They prohibit all shooting, hunting, fishing, horse-racing, gaming, or other public sports on the first day of the week. The fact that the more influential Democrats see that it will not do to pass the New York charter amendments in the shape in which John Kelly and his Tammany allies agreed to them, was shown in the Assembly on Thursday evening, when the bill was recommitted by a vote of 48 to 45. The Anti-Free-Pass Bill was laid to rest on Friday, when it was adversely reported in the Senate. On Monday evening Governor Cleveland sent to the Assembly a veto of the bill to oust the present Republican Fire Commissioners in Buffalo, and substitute Democrats. This act has created great indignation among the Democratic partisans of that city. There was a spirited debate on the Civil-Service Bill in the Assembly on the same evening.

Petitions containing the names of about one thousand leading business and professional men of New York city have been presented in the Assembly by Messrs. Miller and Roosevelt, and in the Senate a large number more by Mr. Pitts, asking for the passage of the bill to regulate and improve the civil service of the State.

Peter Cooper, the venerable philanthropist, who completed his ninety-second year on February 12, died at 3 o'clock on Wednesday morning at the house of his son-in-law, Abram S. Hewitt, in this city. He had contracted a cold which seemed of little importance, and on Saturday, March 31, he drove to Cooper Institute. His cold grew worse that evening, and on Sunday, April 1, pneumonia set in. On Tuesday morning it appeared that he had little chance of life, and he was fully convinced of it himself. He spoke freely of what should be done after his death, chiefly in regard to the interests of Cooper Institute, expressing the wish that his plans for it be fully carried out. He retained consciousness to within a short time of his death, cheerfully bidding his friends good-by. His remarkable career cannot be summarized in a paragraph, but a mention must be made of his chief benefaction—Cooper Institute—on which $1,549,192 has been expended. The announcement of his death called forth tributes of respect from many sources, and flags all over the city were put at half-mast. At 9 o'clock on Saturday morning the body was taken to All Souls' Church, where it lay in state, and was viewed by multitudes until 3 o'clock in the afternoon, when the funeral services were held. The Rev. Robert Collyer delivered the principal address. He was followed by the Rev. Dr. Howard Crosby. At 4 o'clock the body was taken to Greenwood Cemetery, and placed in a receiving-vault. A private burial will take place at some early date.

Ex-President Diaz, of Mexico, was entertained by General Grant at dinner on Wednesday night. On Thursday the Produce Exchange of this city gave him a reception. He was in Boston on Monday and Tuesday.

At Greenville, Texas, the End Hotel, a three-story brick building, fell with a terrible crash at midnight on Saturday. Thirteen persons were buried in the ruins, of whom all but one were killed. The ruins took fire.

Nearly three hundred Mormons, who reject polygamy, under the leadership of Joseph Smith, jr., opened services at the old Mormon Temple in Kirtland, O., on Friday.

FOREIGN.

Startling discoveries were made in England and Ireland during the week of widespread Irish plots to wage a dynamite campaign. A semi-weekly London newspaper, the *City Press*, on Wednesday announced that it had received a letter, without signature, threatening to blow up the Government offices. The affair was referred to the police. Late that night a man was arrested in Fleet Street, having been followed from Birmingham, who had in his possession at his lodgings a box of explosives. The arrest was regarded as very important. Precautions were immediately taken to guard the public buildings, and extra sentinels were posted at Windsor Castle. Considerable excitement ensued in business circles, and it was reported that the whole conspiracy in Great Britain and America was to be exposed. On Thursday nearly half a ton of

nitro-glycerine was seized in London. It was ascertained that the man arrested in Fleet Street had first given his name at his lodgings as Ormund, stating that he was a medical student. Subsequently, he said that his name was Norman. The box of explosives had been obtained from the Birmingham factory mentioned in the following paragraph. Rubber bags, containing nitro-glycerine, were found in Norman's quarters. It is alleged that he is of respectable birth, and that he is the innocent agent of an American named Fletcher.

Another alarming incident of the day was the discovery, by the Birmingham police, in Ladywood, of a Fenian nitro-glycerine factory in full operation. The apparatus for preparing and mixing the explosive compounds was constructed on scientific principles. It was ascertained that the premises had been rented two months ago by a man named Whitehead, an Irish-American, who hung out a paper-hanger's sign. He was arrested when the descent on the place was made. He is described as twenty-five years of age, and has a marked American accent. A considerable quantity of nitro-glycerine was seized, and the detectives believe that the place was the central manufactory of explosives and depot of infernal machines in the kingdom.

The arrest of Norman led to the arrest on Thursday, in Lambeth, a London suburb, of two other men. The first inquiry for Norman's lodgings had been made by an elderly man; subsequently a person who looked like a tramp took a box of explosives there. It is believed that these two men were arrested at Lambeth. Their names are Wilson and Gallagher, and papers were found upon the latter connecting him with Whitehead. His portmanteau was packed with explosives similar to those found in Norman's lodgings. Evidence is forthcoming that all the persons arrested are connected with the Invincibles.

A fourth arrest was made in London on Thursday night of a young man named Henry Dalton, who had arrived from the United States in February. He was an occasional caller at the American Reading Room, and his arrest was owing to papers found on the other prisoners. It is believed that he is an emissary of the dynamite faction in America. He is also suspected of being the perpetrator of the recent explosion at the Local Government Board in Westminster.

The four prisoners were arraigned in the Bow Street Police Court on Friday, charged with having in their possession, with felonious intent, explosive material. They were all remanded without bail. A communication was received at a London police station on Friday that a large quantity of dynamite had been consigned from Liverpool to an address in London.

On Saturday a man named John Kerton was arrested at a railway station in London for connection with the conspiracy. On the same day the Glasgow police arrested a man named Bernard Gallagher, charged with causing the recent explosion at the gas works in that city. He is a brother of the man of the same name arrested at Lambeth.

A man named Ansburghe was arrested in London on Sunday, near Waterloo Bridge. Communications found on Gallagher and Norman connect him with the conspiracy. It is believed that seventy or eighty persons are concerned in the plot. It is said that the Birmingham police have certain evidence that Whitehead and the London prisoners were implicated in the recent outrages in that city. On Monday it was rumored that four more arrests had been made in London. On the same day letters threatening to blow up the Liverpool Post-office were received, and thirty additional detectives were put on duty there, and the fire brigade warned to be ready for any emergency. Additional precautions were taken in Dublin on Tuesday for the protection of the officers of the court trying the Phœnix Park murderers.

Increased excitement was created in Government circles on Thursday afternoon, when the report came from Newry, Ireland, where are situated large Government infantry barracks, that the sentinel guarding the powder magazine had on the previous night challenged a man who was discovered scaling the wall. He fired a shot and gave the alarm, but the search was fruitless.

A large number of Fenian documents have been discovered at Salford, England, and have been forwarded to Sir William Harcourt, Home Secretary. The papers include letters from members of Parliament.

Michael Davitt has written a letter from his prison in Ireland, to the Young Ireland Society of Glasgow, in which he says that the dynamite policy can only have the effect of exasperating the English Democracy.

On Monday Sir William Harcourt introduced a bill in the House of Commons relating to explosives. It provides that the maximum penalty for causing an explosion by which life or property is imperilled shall be lifelong servitude. An attempt to cause an explosion, or the making or keeping of explosives with intent to cause an explosion, is made punishable by imprisonment for a term of twenty years, and the unlawful making or keeping of explosives under suspicious circumstances is to be punishable by fourteen years' imprisonment. All accessories to such crimes are to be treated as principals. Provision is made in the bill for the ordering of official inquiries into the crimes specified, for the arrest of absconding witnesses, and for searching for explosives. The penalties are to be inflicted irrespective of the damage done by the explosives. The bill was with all haste passed and sent to the House of Lords, where it was agreed to without delay. The royal assent was given to the bill on Tuesday, and it became a law.

The men charged with the Phœnix Park (Dublin) murders were brought into court in that city on Monday, under a strong guard. The Grand Jury was sworn; it retired and soon returned with a true bill against Joe Brady, charging him with the murder of Lord Frederick Cavendish. He was arraigned and pleaded not guilty. Curley, Kelly, Thomas Caffrey, and Fitzharris were next each arraigned separately. They each pleaded not guilty. All were held for trial.

At the trial of the prisoners charged with the Phœnix Park murders in Dublin, a photograph of a man named Tynan, recently alluded to by the name of "Tyner," will be produced. This photograph has been identified by James Carey and three other persons as that of "Number One."

In the House of Commons on Thursday Mr. Hugh C. Childers, Chancellor of the Exchequer, laid before the House the budget for the fiscal year ending March 31, 1883. The revenue was £89,004,000. This exceeded the estimate by £4,069,000. He said the expenditures had been £88,906,000, showing a surplus of £98,000. The expenses of the war in Egypt, including the amount contributed to defray the cost of the Indian contingent, were £3,896,000. For the coming year he estimated that the expenditure would be £85,789,000. The national debt was reduced the past year by about £7,100,000, and he expected to make a further reduction this year of about £8,000,000. He expected to see the debt reduced during the next twenty years by £172,000,000. He estimated that the coming year would bring the Government a revenue of £88,480,000, giving a surplus of £2,691,000. Mr. Childers proposed that the tax on railway earnings, where the fares were small in amount, be abolished, and the standard moisture of tobacco and snuff on which exemption was allowed be raised 1 per cent.; that a provision be made looking toward the reduction of the rate for telegrams to 6d. each; that 1½d. of the income tax be removed.

In the House of Lords on Monday, in the case of Clarke against Bradlaugh, Lord High Chancellor Selborne declared that Mr. Clarke, as a common informer, was unable to sue Mr. Bradlaugh for sitting and voting in the House of Commons without taking the oath of allegiance. The judgment against Mr. Bradlaugh was therefore reversed with costs.

The complete recovery of Queen Victoria from the injuries to her knee is less rapid than her physicians had hoped, but she is making progress.

Mr. Herbert Spencer's health causes his friends in England some anxiety. Since his return from America he has been unable to perform his usual quantity of work.

Trouble has arisen in the French Cabinet. At a recent council M. Waldeck-Rousseau, Minister of the Interior, refused to have published in the *Official Journal* a note the effect of which would have been to deprive General de Gallifet of the command of the cavalry. This was the measure of General Thibaudin, Minister of War, and it is said that he threatened to resign. The dispute grew out of the aversion of extreme Republicans to Gallifet and other leaders who took part in the suppression of the Commune. It is generally understood in Paris that a compromise by which the question of cavalry manœuvres was allowed to drop in the Cabinet, is merely to be considered as a postponement of a rupture in that body until the Chamber meets in the latter part of this month.

On Friday night a dynamite cartridge was exploded in the tower of a chateau near Monteceau-les-Mines, France, doing little damage. The London arrests have created considerable uneasiness in Paris.

Louis Veuillot, the French author, and editor of the Paris *Univers*, the leading journal of the advanced French Catholics, died in Paris on Saturday.

The new pier at Nice, France, was burned on Wednesday. The loss is $1,000,000.

A secret Congress of German Socialists was held in Copenhagen last week. On the fourth day of its session it was suddenly broken up by the Prefect of Police. Four of their number, members of the German Reichstag, were arrested at Kiel, and their papers confiscated. They were afterward released.

It was reported on Thursday that a large mine had been discovered in Moscow, connecting with the Kremlin, where the Czar is to be crowned. An official denial was published in St. Petersburg on Friday.

It is asserted in a Roman newspaper that the Governments of Italy and Austria have given their assent and affixed their signatures to a treaty, by the terms of which each empire guarantees to the other complete integrity of territory. Although Germany is not directly and by signature a party to this treaty, the document contains a clause in which it is mentioned that her approval has been given.

The Supreme Tribunal in Leipsic has confirmed the decision of the lower court and acquitted Professor Mommsen, member of the Reichstag, of the charge of libelling Prince Bismarck.

The National Theatre at Berlin was burned on Wednesday afternoon. There was no loss of life.

Baron Wertheim, the wealthiest manufacturer of Austria, died on Wednesday.

The Spanish Chamber of Deputies has passed the bill permitting the substitution of affirmation for the oath when desired.

There have been serious riots among the canal workmen in Panama, originating in race hatred between the Jamaicans and Carthaginians. About twenty of the former have been massacred.

The revolutionists under Alfaro continue to be successful in Ecuador.

PRACTICAL MORAL TRAINING.

No one can have seen or read of the funeral of Peter Cooper on Saturday without being struck by the impression which his career has made on the minds of the younger generation. There has been no such funeral in this city in our time. No such tribute has been paid to a man who never held high political office, and never made any mark in war, or in literature, or in art, or in science. Nor did he owe this to the fact that he was a successful business man, shrewd, enterprising, inventive, prudent, who never made a great mistake, never failed to meet all his liabilities, tried many things and succeeded in all, and, while never speculating, was never left behind in the race of industrial progress. This and other cities have produced many men as skilful in making money as he was—men, too, who owed as little to fortune or extraneous advantages as he did, but who, when they died, got no honor from anybody but their own family and personal dependents or old business associates. What made his death a public event and his funeral a great public occasion, was not only the fact that he devoted so much of his fortune and his energy to the service of his fellow-men, but also to that other fact, of so much importance in our time, which Mr. Collyer described in his admirable address by saying, "Here lies a man who never owned a dollar he could not take up to the Great White Throne." In other words, Peter Cooper was honored because he was a man who had contrived, not for a brief season, but through a very long life, not in one enterprise, but in many, to unite the highest integrity with the highest success, and who had at every step used his success, as far as it went, to make the world an easier and happier abode for such of his fellow-men as he could reach.

All this has, however, been dwelt on in a thousand pulpits and newspapers within the last few days. The point we would here make prominent, and which we could wish had been more frequently touched upon, is the extent to which the honors paid during his life not only to such a man as Peter Cooper, but to every man, are an educating influence for those who are just beginning life. One of the oddest and most persistent delusions of our time is, that the moral training of the young is done or can be done mainly through books and sermons, or, in other words, through direct addresses to the understanding. What makes this delusion all the odder is that everybody knows it to be a delusion by his own experience. Everybody knows in his own case that nothing, apart from hereditary influences, has had so large a part in the formation of his character as the associations and examples of his youth, and, above all, as the careers of those, both in public and private, whom he was taught to admire by seeing his parents and employers and neighbors honoring them. This is so true that one can tell almost with certainty what kind of men any given generation will produce by seeing the kind of men it was taught to applaud and imitate in its childhood.

The lesson of this for the merchants and bankers and preachers and teachers and writers and parents of our time, who are groaning so terribly and with so much reason over the decline of commercial morals—over the frauds and defalcations and embezzlements which have during the last twenty-five years done so much to discredit many American investments, and, what is far worse, to discredit the American name—is that if they wish to have honest clerks and cashiers and bookkeepers, it is not enough to stand uncovered while the story of a long and stainless life like Peter Cooper's is read. To make their admiration of such men as he prove a really fortifying influence to the character of the young, they must refrain from adulterating it by going home and bestowing before all the world precisely the same marks of respect they used to bestow on Peter Cooper on men whose lives are, in every respect but success in money-making, the exact opposite of his; who have accumulated great fortunes by means which he would have loathed; who have used them, not, as he did his, to open paths of usefulness to the poor and helpless, but to work the impoverishment and confusion of their neighbors at home, and the disgrace of their country abroad. They cannot afford to act toward any man in such a way as to produce the impression that there was nothing greater in Peter Cooper's career than his having got hold of a good deal of money and having kept it till he died. For this reason they cannot afford to have it go forth that there is a statute of limitations in the forum of morals, and that everybody who has contrived to outlive his rascalities without losing his booty, ought, to all outward seeming, to be as welcome to their hearts and homes as Peter Cooper, who never let a dishonored dollar into his safe, or spent one hour in corrupting his countrymen or bringing their institutions into contempt.

A good many people who ought to know better think they can consult their own interests by treating successful knaves as Peter Coopers, on the sly, as it were, without letting their young men see the full significance of it; or that they can neutralize any harm that may flow from it by a discourse of unusual vigor on honesty as the best policy, in the church on the following Sunday. But there never was a greater mistake. The young men do not blurt out their impressions about the doings of their elders in the counting-houses, or write them to the Sunday papers, and are perhaps not always conscious of them themselves. But it would hardly be possible for Satan himself to present to them a spectacle better calculated to sap silently the very foundations of character, than bestowing on men of acknowledged and notorious baseness social honors and rewards which they have done nothing to deserve except having, in trying times, successfully escaped the proper legal consequences of their misdeeds. That "no man can serve God and mammon" is a saying of more meaning than some people like to suppose. One of the truths it conveys is, that you must not give to the lucky knave the welcome and the applause which you owe only to him who has all his life long given every man his due, and so used what was his own that his neighbor never had any reason to complain.

THE PROTECTION OF TESTATORS.

The Michigan Legislature has under consideration a bill designed to remedy an evil felt more or less everywhere, but nowhere so much as in this State and city, viz., speculative attacks on the wills of rich men. The measure does not change the existing law with regard to wills, but adds to it a provision that any one who desires to do so may present his will to the circuit or probate judge of the county in which he lives, together with a petition declaring that it was duly executed by the petitioner, that he was of sound mind and memory, and not subject to any undue influence, and praying that it be allowed. He is at the same time to furnish a list of all persons who would be interested in his estate as heirs. A day is then to be appointed for hearing the petition, which the heirs may oppose if they choose. At the hearing the judge is to inquire into the testamentary capacity of the testator, examine any witnesses that may be produced, and if it appears that he is in a fit condition of mind to dispose of his property, is to make a decree establishing the will, which shall be final and conclusive as to the question of testamentary capacity. The contents of the will are not required to be made known.

The opportunity for breaking wills, or instituting proceedings to break them with a view to a "compromise," arises almost altogether from the fact that, at the time when the inquiry into the validity of a will begins, the testator is dead. In nine cases out of ten, so long as he is in the flesh not a whisper is heard as to his sanity. His prospective heirs, far from thinking him unfit to manage his property—and no one who can do this is unfit to make a will—are only too glad to have him go on buying and selling, making contracts, executing deeds, carrying on his business, whatever it may be. The richer he grows, the brighter the future looks for them; and while he is accumulating his money an attempt to deprive him of the power of making a will would usually be regarded in all quarters as mere folly. No jury or court in New York, for instance, could have been got to listen very long to arguments to show that the late Mr. Vanderbilt was incapable of making a will. Yet when he is once dead, the testator is at a decided disadvantage. His daily life was, while it lasted, the best possible proof of his sanity; but, now that he is out of the way, it is comparatively easy for unscrupulous relatives to get up a picture of his existence which is calculated to raise a doubt, and a doubt is enough as a basis for a will contest. All men have peculiarities and eccentricities, and rich men are no exception to this rule; where the man is not alive to explain his acts, nothing is easier than to exaggerate, and distort, and color these until they wear a very dark look. Alienists are called in to give their opinion on the case as presented by the side which employs them, and an alienist retained in this way generally finds what he looks for.

The practice of contesting wills is a growth of the last fifty years, and it was at one time greatly stimulated by the condition of the law

which allowed the contestants to pay the expense of the contest out of the estate, whether they were successful or not. Our Legislature has put an end to this, and contestants have to pay their own way like other litigants. Courts and juries, too, are nowadays less inclined to believe in "insanity" than they were a generation ago. But even with these drawbacks, "striking" the estates of rich men is still a very attractive field for speculation among rascally lawyers, who can greatly embarrass the settlement of them, and thus get themselves and their clients bought off.

Under these circumstances, why should not a man be allowed, as proposed by the Michigan bill, to establish his own testamentary capacity, or, in other words, sanity, during his lifetime? The time when he makes his will is the time at which the evidence on the subject is most accessible; and if all those who could by any possibility be interested in disputing it are allowed an opportunity of doing so, no unfairness seems to be possible. Of course, in ninety-nine cases out of a hundred there would be no opposition, for relatives who did not know the contents of the will would be very chary of making the testator their enemy by disputing his sanity. But then his sanity is not dependent on his manner of disposing of his property, and the opinion of an heir who did not know how it was to be left would be far better worth having than that either of a legatee or of persons "cut off with a shilling." Under the present system, we invariably find that the testimony that the testator was a shrewd, clear-headed man of business always comes from those who get his money; the evidence to the contrary is always that of those who are left out of the will.

In one respect, however, the Michigan bill appears to be impracticable. The question of "undue influence" cannot be properly inquired into as long as the contents of the will are unknown. Undue influence is always exerted by a beneficiary under the will, and without knowing its contents an heir cannot possibly form any opinion as to whether or by whom such influence has been exerted. This is a different matter from that of testamentary capacity.

THE CRISIS IN NORWAY.

A CONSTITUTIONAL conflict of great magnitude and violence has been agitating the Norwegian nation for years, and seems at this moment to be approaching a crisis. The Constitution of the kingdom is the most democratic ever introduced in a monarchical state. It was framed in the spring of 1814, under the auspices of the Crown Prince of Denmark, with the aim of securing the adhesion of the Norwegian people to his scheme of establishing himself on the throne of an independent Norway, at the moment when Bernadotte, then Crown Prince of Sweden, was preparing to invade and occupy the country by right of the Treaty of Kiel, which he had forced the King of Denmark to sign at the beginning of the same year. England and Russia had promised Norway to Sweden as a reward for the latter's services against Napoleon and his stanch ally, Denmark, which was thus to be stripped of a province ruled by the Danish sceptre for centuries. In order to secure the aid of the sturdy yeomanry of Norway in a desperate attempt to save for a Prince of Denmark what the Danish crown had lost, the Constitution then improvised was made as attractive to the rural population as possible. But the attempt of the Danish Crown Prince failed. He was elected King of Norway, but was unable to defend his throne against Bernadotte, and was forced to resign and return to Denmark. The Constitution, however, survived. The King of Sweden, acknowledged by the Norwegians as King of Norway, accepted it, and since November 4, 1814, it has been the law of the land.

The most striking feature of the Constitution is clause 79, limiting the royal veto. This is declared to be only suspensive, and bills passed by three successive Storthings, or Diets, each of which is elected for three years, are to have the force of law, even if the royal sanction is still withheld from them. Thus the democratic legislature is made all but sovereign, the Crown being able to check legislation deemed obnoxious only for a limited number of years. This power of passing its resolutions over the King's veto the Storthing made use of, in 1821, for the abolition of nobility, decreeing it after vetoes in preceding years. And were there no clause conflicting with or qualifying this fulness of legislative power, the right of the people to abrogate by law—that is, through a resolution passed by simple majorities in three successive Storthings—even the connection with Sweden under a common dynasty, and royalty itself, and thus turn Norway into an independent republic, would be uncontested. And such an act would be the less improbable as the national legislature consists in reality only of one house, though the Storthing, after assembling, divides itself into two branches—the Lagthing and the Odelsthing—the former comprising an elected fourth of the members, and the latter the remaining bulk.

Clause 112, however—the last clause of the Constitution—places the legal aspect of affairs in a different or at least a dubious light. It enacts that when experience shall have demonstrated the necessity of changing a part of the Constitution itself, the amendment shall be proposed in the Storthing then assembled, and decided upon by the following Assembly. "Such a change, however, must never be contrary to the principles of this fundamental law; it can have no object but such modifications of particular regulations as do not alter the spirit of this Constitution; and two-thirds of the Storthing must be in accord on such a change." The King's veto power is not alluded to in this clause, which lacks precision in many respects. And it is the indefiniteness and obscurity of this brief and important paragraph which has given rise to the violent contest now taking place between the Storthing and the Norwegian Government of King Oscar II. This monarch is less popular in the western of the two realms united under his sceptre than any of the successors of Bernadotte, whose sword created their union in 1814, and whose dynasty succeeded to the Vasas of Sweden in 1818. The higher and wealthier classes of the Norwegian people, and especially the mercantile population of the capital, Christiania, have often sided with the Ministers—the "State Councillors"—of the Crown on questions of policy or prerogative; but the peasantry, whose representatives form a large majority in the Storthing, have always been jealously hostile to the rights and claims of the dynasty which was imposed upon them by force, and long contention has ripened a spirit of opposition avowedly republican. The poet Björnson is one of the leaders in this new movement.

In 1874 the Storthing passed a resolution compelling the State Councillors to appear at its sittings, which the Constitution neither bound nor entitled them to do. As this was done with the intention of more closely subjecting them to the sway of the Legislature, the King vetoed the resolution. In 1877 the Storthing passed it again by an increased majority, and the King again refused to sanction it. On March 17, 1880, the resolution was carried by a still larger vote, and on June 9 the Government was notified by the Storthing that its decision, though unapproved by the King, had become a law. Oscar II., however, who had come over from Stockholm to Christiania to compromise matters, but had failed to obtain for his sanction the concession of the right to dissolve the Storthing, declared, on the advice of his Cabinet, that the resolution of March 17 was a constitutional change, which could not be effected without his approval, and, being unsanctioned, his Government would not promulgate it. A few days later the session of the Storthing was closed without a speech from the throne. The excitement was so great that the Government was compelled to use military precautions, which were also needed on account of workmen's agitation. Another complication added fuel to the strife. The Storthing, before dissolving, appointed a commission on military matters, which was to remain in permanency till the next legislative session. The Government denied the right of the Storthing thus to prolong its activity, and appointed a military commission of its own to replace the other. The Storthing commission, however, went on with its work. Sverdrup, the President of the Storthing and leader of the Opposition, received popular ovations. Both sides persisted in asserting their right.

The organs of the Government maintained and still maintain that the resolution compelling the attendance of the State Councillors at the sittings of the Storthing is one falling within the category of constitutional changes; that the King (though this is not expressly stated in the fundamental law) naturally possesses a veto on all measures contemplating an amendment of the Constitution, and that this implied veto must be an absolute, and not merely a suspensive one, for otherwise the whole structure of the kingdom would be subject to a total overthrow by a resolution more easily passed than a law of the least importance. The champions of absolute popular sovereignty, on the other hand, assert that no veto can be claimed which is not expressly granted, and that the nation possesses the same right to amend and also entirely to reconstruct its fundamental charter which it exercised in originally framing it—the requisi-

tion of two Storthings and of a two-thirds majority in the second of them being a sufficient safeguard against precipitate and inconsiderate action. Between these two extreme views the Law Faculty of the University of Christiania, when applied to by the Government for an expression of opinion on the controversy, took a middle ground, guardedly declaring that the King certainly had the right of veto in the special case before it; that is to say, as to the general question, that clause 112 impliedly gave the sovereign the right to reject amendments of the Constitution deemed by him in conflict with its spirit and general principles. That the framers of the Constitution did not contemplate the right of the Storthing alone to undo their work at pleasure lies in the nature of things, and will hardly be doubted by any unbiassed student of history; but whether they meant to leave the decision as to what is contrary to the spirit of the charter to the King is a matter of fair controversy. Unfortunately, they neither clearly vested this right in him nor created a tribunal —like our Supreme Court—to decide, in cases of conflict, between him and the legislative power.

The great constitutional conflict has constantly grown more and more violent. That partisan fury has not yet led to an appeal to force is mainly attributable to the expectation on each side that the results of the general elections for a new Storthing would compel the opposite side to yield. The elections took place at the close of 1882, and the result was a triumph of the popular party, in spite of strenuous efforts made by the friends of the Government to win over the wealthier portions of the peasantry. And scarcely was the new Storthing assembled, in February last, when the leaders of the Opposition hastened to force an issue by initiating measures for the impeachment of the State Council, or Ministry, mainly on the ground of its having violated the Constitution by not promulgating a law passed by three successive Storthings, and by its action in the affair of the military commission. That such an impeachment was not decided upon at an earlier stage of the conflict was owing to the uncertainty which prevailed concerning the political complexion of the mixed court before which the accused functionaries would have to appear. This court is to be composed of the members of the Supreme Tribunal of the realm, a conservative body, and of those of the Lagthing, or smaller branch of the Storthing; and the accused have the right to object to the presence of one-third of the judges thus constitutionally designated for their trial. But the present complexion of the Storthing renders it certain that even if only members of the Lagthing should be excluded, and all the members of the Supreme Tribunal should vote for the Government, there would still be a majority for condemnation. The leaders of the democratic party have grasped this favorable opportunity with passionate eagerness, and the country—and no doubt all Scandinavia—looks with intense anxiety for the development of the momentous political drama now opening.

CAN A GIRL BE A DUDE?

We have received from several correspondents and subscribers inquiries suggested by our recent article on the Dude, and among others one which, in the present condition of society and the two sexes, seems of more than common interest—viz., whether there is any reason to expect the development among girls of a type analogous to the Dude among men. The possibility of the development of girl Dudes, either by natural selection, or by artificial means, is a serious matter, whether we look at it from the point of view of the Dude, or from that of the girl; and in the interest of both we shall endeavor to give the question an impartial examination.

Male Dudes are, by temperament and disposition, conservative, and on this account might be inclined to look with disfavor upon any attempt on the part of girls at such an encroachment on their sphere; but their feeling about the matter is by no means conclusive, for conservatives oppose every new opening which women endeavor to make for themselves. It is against the opposition of conservatives that they have forced their way into the universities, the bar, the press, the lyceum, and the pulpit, and there is not an argument which can be advanced against preparation for the career of girl Dudes that cannot be urged against these other occupations. Dr. Dix, to be sure, insists that the true sphere of the girl is home, and her sole proper career that of wife and mother, and it must be admitted that a mother of a family could hardly be a Dude; but then everybody is not so consistent and logical as Dr. Dix, and besides, the Doctor in his Lenten lectures did not consider the Dude question at all. The propensity of the "society girl" for pure "cussedness" was what the Doctor undertook to expose, and he handled the subject in such a way as to make it clear to any girl not absolutely steeped in crime that there is really no place like home; but the girl as a criminal we must leave to clergymen and the State Charities Aid Association. What we are interested in is a purely social problem.

Admitting, then, that if a girl wants to be a Dude, the dislike of the Dudes to the experiment would constitute with fair-minded people no valid reason for preventing her, it remains to be considered whether there is anything in the nature of the occupation itself which specially fits or unfits girls for the task.

In one sense there is something girlish about every true Dude, and at the same time something of the Dude about every true girl. They are both primarily interested in dress, as developed and regulated by fashion and as displayed in public places, and this too in much the same way; and it is a curious and interesting proof of this that the tall hat in the hands, or rather on the head, of the Dude is becoming a feature in male costume quite as important as the bonnet ever was with women. Another point which should not be overlooked is, that for many years girls have been consciously imitating male fashions in dress, and, while conservatives have been showing the folly of their trying to vie with men, have actually adopted men's clothes, and now wear, and for a long time have worn, the male ulster, the male cut-throat collar, the heavy male boot, and at least one variety of male hat. To a certain degree clothes have ceased to be a discriminating mark of sex, and caricaturists in the comic papers frequently raise a laugh by representing the likeness as likely to cause a confusion in the mind of the beholder. A travelling girl, provided with what is called a "pot hat," and carrying what is known to the journalist as a "grip-sack" and a silver-handled umbrella, is, in the distance, of doubtful sex. This development of the dress of girls, going on under our very eyes, has been, curiously enough, overlooked by those who have given the closest attention to the woman question.

Externally considered, therefore, there are a good many reasons for regarding girl Dudes as a possible future social type; but it will not do to limit our inquiry in this way. The capacity for the career of a Dude is not altogether a question of costume; it is dependent to a certain extent upon moral and intellectual considerations, and, inquiring into the aptitude of girls for a new sphere, the moral and intellectual tendencies of the occupation must not be neglected.

Now, the American girl has secured her present social position as the manager of society by the display of brilliant qualities of head and heart. In other countries society has been managed by married people much in their own interest. If the American girl has prevented this class from having much to do with it, it has been by her superior energy, resource, endurance, and audacity. These are the qualities which in all countries and in all ages have produced success in every field of activity; and if society has, with us, passed into the control of girls—if they have to a great extent emancipated themselves from their primitive subjection to parents and chaperons, and now manage society according to their own notions of what is their due—we may be sure that this is owing to their fitness for the task. But the rise in importance and interest of the girl in the modern world has, it must be confessed, been attended by corresponding changes in the other sex. As the girl has become more and more energetic, more and more self-reliant, as she has taken the initiative more and more, and driven her father and mother more and more into the social background, the opportunity for the development of shy, shrinking traits of character, of quiet, modest reserve, has necessarily fallen more and more to men. This has greatly helped the Dude, for it enables him to make himself attractive to daring and high-spirited girls by those very qualities which used to be regarded as contributing so much to produce feminine charm. The girl, as she has become more and more conscious of her own power, has felt the need in the opposite sex of something different from herself — something milder, softer, more gentle, quiet, and dependent. She has often to seem hard and worldly, for otherwise society could not be carried on by her, but she is really fond of other and better things. For these she looks to man. Intellect, vigor, enterprise, she finds in her own sex. The ineffable charm of quiet refinement and repose society must get elsewhere. The demand has created the supply, and produced already great modifica-

cations in the male social type. The Dude caricatures this tendency, but in the existing condition of society the part taken by him would seem to be one which girls could hardly assume without abandoning many of the advantages which make their position so proud, independent, and commanding.

MORE IRISH TROUBLES.

LONDON, March 22, 1883.

THE first section of the present Parliamentary session, that which has just closed at the beginning of the Easter vacation, has been singularly barren. Such appetite for useful work as the legislators brought with them to the House of Commons on February 15 was dulled by the tedious debate on the Address to the Crown, which lasted for a fortnight, and the few Government nights since then have been almost wholly occupied by a discussion of the supplementary estimates for the financial year that is now ending. With the exception of a spirited debate on South African affairs (which I will not describe in this letter because it has been adjourned till after Easter), the discussions raised by private members have lacked interest.

Two events have, however, taken place of more than passing importance, both of them bringing to the front that irrepressible Irish difficulty which is still the foremost subject in men's minds. The first of these was the complaint made by the Parnellite members that no means were being taken by the Government to deal with the distress, amounting almost to famine, which is alleged to exist in parts of the West of Ireland. The Lord-Lieutenant, it was urged, ought to relax the rules which prohibit Poor-Law guardians from granting out-door relief; and public works ought to be started on a scale large enough to give employment to the starving people. To these demands the Irish Government has replied by denying that the distress is exceptionally serious, and by declaring that the best way to aggravate it and prevent the poor from recovering from their depressed state would be to extend state help, in the form either of work provided for the purpose or of laxly distributed poor-law relief. As to the bad effects of out-door relief, the opinion of our trained economists is unanimous. They would gladly abolish it altogether, both in England and Scotland, compelling every one who asks for public relief to take it in the workhouse; and they hold that the one thing which has saved Ireland from falling into the abyss of perennial pauperism is the strict application of the workhouse test. Hence English opinion, even among those who go furthest in their sympathy with Ireland, has supported Lord Spencer in this matter; and the unmeasured denunciations of him which the Nationalists indulge in have made English readers think less than ever of their judgment or their fairness.

These denunciations had hardly died away when Mr. Parnell introduced his bill for the amendment of the Land Act of 1881. That measure, as your readers will remember, was strenuously opposed by the Tory party in the House of Commons, and was largely modified in the House of Lords. It passed in a shape so unwelcome to the Parnellite members that they declared it must prove a failure, and tried to make it so, while the tenant-right Protestants of Ulster were far from being satisfied with it. It has now been in operation for a year and a half, and among the flaws discovered in it four are particularly complained of. The first is that it does not include all kinds of landed property and all species of tenants, and in particular that it excludes leaseholders, who were as much entitled to protection as yearly tenants. The second is that its operation is so slow, arising from the enormous number of applications made to it, that half the tenants who have sought to have their rents reduced are still paying the old rent because the Land Courts have not yet been able to attend to them. The next is that sufficient allowance has not been made for the tenants' improvements in fixing the rent. The intention of the Government and of the Parliamentary majority was, it is said, that a tenant should not pay rent upon his improvements; in other words, that their value should be previously deducted before the fair rental for the farm was estimated. This intention has been defeated by a decision given by the Irish courts on the construction of the Act, and accordingly the tenants are being required to pay a higher rent than either they or Parliament expected. Lastly, the scheme for enabling the tenants to purchase, by the aid of state loans, the land which they cultivate, has produced little result. A very small number of applications have been made under the clause containing this provision; in point of fact, the number of peasant proprietors is not increasing. A bill to remedy these four defects in the Land Act, together with others of less interest, was brought in by Mr. Parnell, and much curiosity was felt to see how Mr. Gladstone would receive this attempt to improve the largest measure he had ever carried, the child of his old age, the piece of work in whose success as a means of conciliating Ireland he is so intensely interested.

Though he returned from Cannes at the beginning of March, he had delivered no considerable speech, and rumors were spread that he was feeble in health and likely soon to retire from power. His speech on Mr. Parnell's bill gave no countenance to such rumors. Though he has become thinner within the last few months, and has now the sunken face and weaker presence of an old man, he looks healthy, his voice is full and firm, and his mental powers certainly show no sign of decline. In manner and delivery, in clearness, precision, and measured skill of statement and argument, the speech was one of his best. But it gave more satisfaction to the Tories than to his own followers, for it was a steady refusal to open up the land question afresh, even so far as to remedy such defects in the Act of 1881 as had been shown to exist. He based this refusal on the difficulty of finding time for handling the question—partly because legislation for England and Scotland was so much in arrear, owing to the demands made from Ireland during the two preceding sessions; partly because any bill dealing with Irish land would be sure to be used as a battle-ground both by the Tories, who would like to reverse the action of 1881, and by the Parnellites, who would try to force Parliament much further. It was thus, he said, impossible for the Government to undertake itself to settle the question, while Mr. Parnell's bill was much too sweeping in its changes to obtain his support. This firmness pleased the moderate Liberals, who are always grumbling at the Government for its readiness to make "concessions to agitation," and elicited unusual cheers from the Conservative benches. The Irish Nationalists were neither surprised nor annoyed. They knew that nothing the Government would give would satisfy their own constituents, and therefore preferred it should, by giving nothing, make their vantage ground of grievance a stronger one. The Ulster Liberals, however, a section small in number—they count but nine members in the House of Commons—but important as representing the only part of Ireland where the population is heartily and actively loyal to the connection with Great Britain, were mortified. The Ulster tenant farmers have insisted on an amendment of the Act of 1881 just as strongly as Mr. Parnell does, and may, it is feared, fall away from the Government if their wishes are not gratified, and it would appear that a considerable section of the English and Scotch Liberals feels with them.

For some time past there have been signs of a division of opinion on Irish topics in the Liberal party, which may, when Mr. Gladstone no longer holds it together, lead to a serious schism. One view is that enough, if not too much, has been done for Ireland in the meantime; that what she needs is a firm and strict administration of the law; that concessions on the land question would only encourage agitation, while to concede a more popular system of local government, or a more extended franchise, would only give the party of rebellion and anarchy wider opportunities of troubling the country. Lord Hartington, who would succeed Mr. Gladstone if the latter were to retire, is supposed to hold this view; it would probably be that of Lord Derby, Sir William Harcourt, and some other members of the Cabinet; it is the general view of the London press, and of Liberals as well as Tories among the upper and professional classes. In an extreme form it finds frequent expression in the *Times*. On the other hand, there are Liberals who argue that, so long as Ireland needs reforms, Parliament must go on legislating for her, and that however loud the calls of England and Scotland, England and Scotland must be content to forego much of the time they would be entitled to in order to let Irish questions be settled. It was not much use, they say, to make the great concessions of the Land Act unless you are prepared to complete the work by other measures. Even if the Irish abuse the larger amount of local self-government it is proposed to give them, it is better they should govern themselves worse than that others should govern them better.

The very day after the debate in Parliament on Mr. Parnell's bill had brought these old questions back to the minds of politicians, the explosion at the office of the Local Government Board, startling the country like nothing else since the Phœnix Park murders, summoned every one once more to consider what is to be done with Ireland. It was all but universally assumed that the deed was perpetrated by Fenians, for, though Socialists and Freethinkers have been suggested, neither of these insignificant sections has ever given any overt sign of a tendency to crimes of violence. There was less excitement, less passion, than might have been expected, partly perhaps because no one was killed or even seriously hurt—a remarkable thing in a crowded city. But the effect has been to strengthen in a marked manner the first of the two types of view which I have been describing, and to dishearten the friends of Ireland. Several organs seized on the fact that Mr. Gladstone's refusal to amend the Land Act had been declared the day before, and represented the explosion as the answer of Ireland to his words. Far-fetched as this was, since it is plain that the plan for injuring the public offices must have been conceived long before, and was probably executed by people who knew or cared very little what took place in Parliament, the coincidence made some impression on men's minds. It was in vain to answer that the dynamite men had nothing to do with Mr. Parnell and his friends, were not only unconnected with them, but probably hostile to them, glad to discredit them and to interrupt anything in the nature of constitutional agitation. People came back to the idea that Irish violence was not being appeased by conciliatory measures, and that nothing but severity would crush it down. When it was urged that Mr.

Parnell could no more be made responsible for the acts of desperate ruffians than the Progressist party in Germany for the attempt of Nodel to murder the Emperor, they answered that he had never denounced crime with sufficient energy, nor separated himself conspicuously enough from O'Donovan Rossa and the American-Irish press, which has preached the gospel of explosion all through.

However, there has been at bottom a feeling that till something more is known about the planners of this outrage, it is unfair to visit it on the people or any popular leader. If nothing else of the same kind happens soon, it will hardly affect the policy of the Government. But if other acts of violence take place in England, and especially if lives are lost, there may come an outburst of anger such as has not been yet witnessed, and which will destroy for the present all prospects of conciliation. The reported attack on Lady Florence Dixie was at first regarded as another instance of Irish outrage. But now most people think that whatever foundation there may be for the published story, it has nothing at all to do either with Ireland or the Land League, and those who assumed such an origin for the attempt are a little ashamed of their precipitancy. Still, the position is strained and painful; and we watch every morning's news with as much anxiety as curiosity. Y.

THE LATE MASTER OF THE ROLLS.

LONDON, March 26, 1883.

THE legal profession in America takes so much interest in the bench and bar of England that there are probably many among your readers who will wish to hear something about a legal luminary of such exceptional brilliance as the one whom we have just lost, Sir George Jessel, for ten years Master of the Rolls. Here in England even the general public, which seldom realizes or cares about the personality of a judge, had got to know and value him, so that his death, long before the usual term of judicial activity, is felt as a national misfortune.

He is only one among many instances we have lately had of men of Jewish origin climbing to the highest distinction, but is the first instance of a person who, adhering to the creed of his forefathers, received a very high office; for Mr. Disraeli, as every one knows, had been baptized as a boy, and always professed to be a Christian. Jessel's career was not marked by any remarkable incidents. He rose pretty quickly to eminence at the bar, being in this aided by his birth; for the Jews in London as elsewhere hold together, and take a natural pleasure in pushing forward any specially able co-religionist. His powers were more fully seen and appreciated when he became a Queen's Counsel, and brought him with unusual speed to the front rank. He entered Parliament at the general election of 1868 as a Liberal, and three years later was made Solicitor-General in Mr. Gladstone's first Government, retaining, of course, his private practice, which had become so large that there was scarcely any case of first-rate importance brought into the Chancery Courts in which he did not appear. Although a pretty decided Liberal, as the Jews mostly were until Lord Beaconsfield's foreign policy began to lead them into other paths, he had never taken any active part in politics till he took his seat in the House of Commons; and when he spoke there, he obtained no great success. Lawyers in the English Parliament are under the double disadvantage of having had less leisure than most other members to study and follow political questions, and of having contracted a manner and style of speaking not suited to an assembly which, though deliberative, is impatient.

Jessel's ability would probably have overcome the former difficulty, but less easily the latter. Though he was easy and powerful in his treatment of legal topics, he was never popular with the House of Commons, for he presented his views in a hard, dry, dogmatic form, with no graces of style or delivery. However, he did not long remain in that arena, but on the retirement of Lord Romilly from the office of Master of the Rolls, was appointed to succeed him in 1873. Here his extraordinary gifts found at last their proper sphere. The Equity Judges in England sit without a jury to hear cases, with or without witnesses, and deal with a great deal of the heaviest business that is brought into the courts. Commercial causes of the first importance come before them, no less than those which relate to trusts or to real property; and the granting of injunctions, a specially serious matter, rests in their hands. Each Equity Judge sits alone, and the suitor may choose before which of them he will bring his case. Among the four—since raised to five—Equity Judges of first instance, Jessel immediately rose to the highest reputation, so that most of the heavy and difficult cases were brought into his court. He possessed a wonderfully quick, as well as powerful, mind, which got to the kernel of a matter while other people were still hammering at the shell, and which applied legal principles just as swiftly and surely as it mastered a group of complicated facts.

The Rolls Court used to present, while he presided over it, a curious and interesting sight, which led young counsel to frequent it, who had no business to do there, for the mere sake of watching the Judge. When the leading counsel for the plaintiff was opening his case, Jessel listened quietly for the first two minutes only, and then began to address questions to the counsel, at first so as to guide his remarks in a particular direction, then so as to stop his course altogether and turn his address into a series of answers to the Judge's interrogatories. When, by a short dialogue of this kind, Jessel had possessed himself of the vital facts, he turned to the leading counsel for the defendant, and asked him whether he admitted such and such facts alleged by the plaintiff to be true. If they were admitted, he indicated his view of the law, and, by a few more questions to the counsel on the one side or the other, as the case might be, elicited their respective legal grounds of contention. If the facts were not admitted, it of course became necessary to call the witnesses or read the affidavits—processes which the vigorous impatience of the Judge considerably shortened. But more generally his searching questions and the sort of pressure he applied so cut down the issues of fact, that there was little or nothing to adduce evidence about, and then he proceeded to deliver his opinion and dispose of the case. It was, all through, far less an argument and counter-argument by counsel than an investigation by the Judge, in which the only function of the counsel was to answer the Judge's questions concisely and exactly, so that he might as soon as possible reach the bottom of the matter. The bar in a little while got to learn and adapt themselves to his ways, and few complained of being stopped or interrupted by him, because his interruptions, unlike those of most judges, were never inopportune or confusing. The best counsel felt themselves his inferiors, and recognized not only that he was better able to handle the case than they were, but that the way they presented their facts or arguments would make very little difference to the result, because his penetration was sure to discover the merits of each contention, and no pertinacity or eloquence would have the slightest influence on his resolute and self-confident mind. It is not wonderful that in this way business was despatched before him with unexampled speed, and that it became a maxim among barristers that, however low down in the cause-list at the Rolls your case might stand, it was never safe to be away from the court, so rapidly were cases "broken down" or "crumpled up" under the strokes of this vigorous intellect. What was more surprising was, that the suitors and the public generally acquiesced, after the first few months, in this way of doing business. Nothing breeds more discontent than haste and recklessness in a judge; but Jessel's speed was not haste. He did as much justice in a day as others in a week; and those who, dissatisfied with these rapid methods, tried to reverse his decision before the Court of Appeal, were very seldom successful, although that court then contained in Lord Justice James and Lord Justice Mellish two very strong men, who would not have feared to differ even from the redoubtable Master of the Rolls.

In dealing with facts Jessel has never had a superior, and in our days, perhaps, no rival. In his treatment of the law, every one admitted and admired both very wide and accurate learning and an extremely acute and exact appreciation of principles, a complete power of extracting them from past cases and fitting them to the case in hand. His strength made him bold; he went further than most judges in readiness to carry a principle somewhat beyond any decided case, and to overrule an authority which he did not respect. The fault charged on him was his tendency, characteristic of the Hebrew mind, to take a somewhat hard and dry view of a legal principle, overlooking its more delicate shades, and, in the interpretation of statutes or documents, to adhere too strictly to the letter, to the neglect of the spirit. As an eminent lawyer said: "If all judges had been like Jessel, there would have been no equity." In this respect he may be deemed inferior to a great living ex-Judge, Lord Cairns—Lord Chancellor in the Beaconsfield Government — who unites to a very wide and accurate knowledge of the law a grasp of principles even more broad and philosophical than Jessel's was. In spite, however, of this defect, the judgments of the Master of the Rolls, which fill so many pages of the English Law Reports during the last ten years, are among the best that have ever gone to build up the fabric of the English law. They were usually delivered on the spur of the moment, after the conclusion of the arguments, or of so much of the arguments as he allowed counsel to deliver; but they have all the merits of carefully-considered utterances, so clear and direct is their style, so concisely as well as cogently are the authorities discussed and the grounds of decision stated. The bold and sweeping character which often belongs to them makes them more instructive as well as more agreeable reading than the judgments of most modern judges, whose common fault is a timidity which tries to escape, by dwelling on details, from the enunciation of a definite general principle.

At the bar, Jessel had been far from popular; for his manners were unpolished, and his conduct toward other counsel overbearing. On the bench he improved greatly, and became liked as well as respected. There was a sort of rough bonhomie about him, and in particular a good-humored wish to deal gently with juniors; there was also an obvious anxiety to do justice, and a readiness, remarkable in so strong-willed a man, to hear what could be said against his own opinion, and to reconsider it. Besides, a profession is always proud of any one whose talents adorn it, and whose eminence seems to be communicated to the whole body.

Two years ago the office of Master of the Rolls,

which had been, since ever the Chancery became a law court, under the earlier Plantagenet kings, that of a judge of first instance, was changed in its character, and attached to the Court of Appeal. Thus it was as an appellate judge that Jessel latterly sat, giving no less satisfaction in that capacity than in his former one, and being indeed confessedly the strongest judicial intellect on the bench. Outside the profession, his chief interest was in the University of London, at which he had himself graduated. It is not, strictly speaking, a university, but merely a corporation empowered to grant degrees. He was a member of its senate, and took much interest in its examinations, as well as in the affairs of the four inns of court, of one of which, Lincoln's Inn, he served as treasurer, being up till the last excessively fond of work, and finding that of a judge who sits for five or six hours daily insufficient to satisfy his appetite. He was not what would be called a cultivated man, although he knew a great deal beyond the field of law—mathematics, for instance, and botany—for he had been brought up in an unrefined circle, and had been absorbed in legal work during the best years of his life. But his was an intelligence of extraordinary power and flexibility, eminently practical, as the Jews generally are, and yet so powerful as to be also truly scientific. And he was also one of those strong natures who make themselves disliked while they are fighting their way to the top, but grow more genial and more tolerant when they have won what they sought, and see that others admit their preëminence. The immense services which he rendered as a judge illustrate not only the advantage of throwing open all places to all comers—the bigotry of the last century excluded the Jews from judicial office altogether—but also the benefit of having a judge at least equal in ability to the best of those who practise before him. It was because he was so easily master in his court that the chief judicial business of the country was despatched with a swiftness and a success which we are not likely to see again. Y.

THE CORRESPONDENCE OF GEORGE SAND.—I.

PARIS, March 15, 1883.

THE fourth volume of the 'Correspondence of George Sand,' which has just appeared,* begins in 1854. She is at Nohant, with her two children, Solange and Maurice, gardening, as she says, with fury, five hours a day, writing novels and dramas the rest of the time, sending a letter one day to Barbès, who was a prisoner at Belle-Isle-en-Mer, and the next day to Prince Napoleon—the same who made such a stir two months ago by a placard at Paris. "My dear Prince," writes this ardent friend of the Republican and Socialist Barbès, "you ask me to write to you. I hardly dare, you must have so little time for reading. Here are two lines to tell you that I always love you, and that I think of you more than you think of me." This letter, sent to the Prince in Paris, was received by him at the camp of Jafeli, near Varna; the Crimean War had begun, and the Prince had the command of a division. "As for the issue which you desire," writes Madame Sand, "the resurrection of Poland, it will come perhaps fatally. . . . Adieu, dear Imperial Highness, always a citizen, and now more than ever, since you are now a soldier of France."

The Emperor Napoleon, who felt himself very strong, having become the ally of England, offered to pardon Barbès; but Barbès would not accept a pardon, and Madame Sand had on this subject a curious discussion with him. "Accept," she said, "whatever people may say. You will be forced to do so. Prisons do not take back voluntary victims." She goes so far as to advise him not to leave France. "No, don't do it. You are free, without any conditions. . . . Remain in France. . . . Stay with us; people become smaller in foreign lands. They do not see right; they become bitter; they become ungrateful toward their native country." She begs him to come and see her. She begins to theorize:

"Some actions are fine, and some are good. Charity can even shut the mouth of honor. I do not speak of true honor, of the honor which is kept in the closet of conscience, but of visible and brilliant honor, of honor which has become a work of art and an historic glory. This kind of honor, like the honor of the heart, has got possession of your existence. You have already become an historical figure, and you represent, in our days, the type of the hero, lost in our sad society. Let me, however," she adds, "defend charity—that wholly religious virtue, wholly interior, wholly secret, of which history will not speak. . . . In my opinion, charity screamed to you: 'Remain, and don't speak; accept this pardon; your chivalrous pride rivets chains and tightens dungeon bolts: it condemns to perpetual exile the proscribed of December; it condemns to misery, to a fearful misery, many whole families. Ah! you have lived in your strength and in your sanctity, and you have not seen the women and the children weep. In the cruel party to which we belong, one blames the fathers of families who ask to come back and to gain bread for their children; it is odious."

Here Madame Sand becomes herself; she is a woman. But why did she not preach charity before as well as after? Why did she flatter the passions of the multitude? Why did she rouse the anger of the workingmen? Who sent those unfortunate and ignorant fathers of families to the barricades of February, 1848, and of June, 1848? Who said to the populace: "You are great; you are sublime; you are the true, the only master"? The mischief was done, even before the *Coup d'État* of December. Hundreds of Republicans had been sent into exile, not by Napoleon III., but by the Republic of 1848. Still, we cannot wonder if Madame Sand, seeing the Second Empire established, tried as much as she could to help the proscribed and the prisoners. Her pride had fallen. She did not speak any more as she did in the "Bulletin of the Republic"; she abused the "ferocious" politicians: "They demand that all their brethren should be saints! Have they the right to do so? You, perhaps, had such a right? but can anybody have it? I never felt that I had myself; I have helped as many as possible to come in or to come out. To come in—those whom exile would have killed; to go out—those who by staying would have gone to their ruin. . . . I do not despise the men who are neither heroes nor saints. It would be necessary to despise too many, and myself among the rest, as I could never harden myself before the sight of suffering." She speaks to this vain Barbès almost in the tone of the 'Imitation of Christ': "I am not sure that those who have sacrificed their activity, their career, their political future, even their reputation, have not been, in some circumstances, the true saints and the true martyrs."

In 1855, Madame Sand lost her granddaughter, the child of Solange, who was married to the sculptor Clésinger. This marriage was not a fortunate one. Madame Sand did not like her son-in-law, but had a very great affection for Solange and her child. She always felt the necessity of theorizing, even over her own sufferings, and she plunged into a work of the Saint-Simonian, Jean Reynaud, in order to find arguments in favor of the immortality of the soul.

She left some time afterward for Rome. Curiously enough, she does not seem to have much liked the city of ruins—the city of the soul, as Byron called it. "It is fine, it is interesting, it is astonishing; but it is too dead, and one ought to know by heart not only the famous book, 'Rome au siècle d'Auguste,' but also the history of Rome at every epoch of her existence. . . . There was a time, under the Empire, when people sat on a broken column and meditated on the ruins of Palmyra [an allusion to the 'Ruins' of Volney]. It was the fashion—everybody meditated. Now people prefer to live." She complains of the dirt and filth of Rome; she does not even like the Campagna: "The Campagna of Rome, which has been so praised, is truly of a singular immensity, but so flat, so naked, so deserted, so monotonous, so sad!" She enjoys the mountains, the hills of Frascati. She remained some time at Frascati with Maurice, who was convalescent, enjoying the flowers, the rivulets, the cascades, the old and monstrous trees, the ruins, the broken statues, the mosaics, the galleries, the endless staircases—all those vestiges of the wealth of the ancient Romans, placed before a great panorama of mountains and of plains. This great Campagna of Rome appears from the hills of Frascati like a sea surrounded by mountains. She spent Easter at Rome, and received the famous benediction, "urbi et orbi," but she did not admire the *mise-en-scène*. "The French taste," she says, "is wanting in everything—in this as in all other things." She did not feel the seductive power of Italy. "Too many things here are not in harmony with our ways of seeing and of feeling; it is well to have seen them, however, if only to make us love all the more our France with her gray sky, where the men, even though not what they ought to be, are more manly than anywhere else." Maurice, who was an entomologist and a botanist, was perfectly happy; he was also an artist, and made many sketches. Madame Sand writes on the 9th of May from Spezzia; in July she was back again at Nohant.

"The Mariage de Victorine" is the only play of Madame Sand's which has been adopted in what is called the *répertoire* of the French Theatre. It is truly charming, played, as it is now, by Mlle. Barretta. It was intended to be a sequel to Sedaine's "Le Philosophe sans le savoir," one of the good plays of the end of the last century. Madame Sand writes on the subject to Jules Janin:

"I hate the bourgeois so little that I have adopted in the 'Mariage de Victorine' the *donnée* of Sedaine concerning M. Vanderke, who, being a nobleman, made himself a merchant, and who found in his work, in his liberality, in his probity, in his wisdom, in his modesty, the humble and true glory of a character which Sedaine summed up in one word, 'philosophe sans le savoir.' In the same piece, the wife, the daughter, the son of Vanderke are loving, sincere, and good creatures. I have changed nothing in the types of the master, and I have developed the type of *Antoine*, the business man, the friend of the house, the *petit bourgeois*, who is a model of disinterestedness and of fidelity. Then I have created the type of *Fulgence*, another *petit bourgeois*, a mere clerk. . . . The 'Mariage de Victorine' is, therefore, a piece set in the midst of the bourgeoisie, and a modest but sincere apotheosis of the virtues of this class, when it understands and practises its true duties."

In this letter to Jules Janin she compares the old bourgeoisie, counting every night the modest profits of work and of trade, with the great bourgeoisie of our day, which lives on the profits of speculation, on chance. "There is no longer any question, in order to build a fortune, of working patiently and daily, of having the virtues of trade or the inspirations of art; you must understand the mechanism of banks, the calculations of chance; you must play boldly; you must know that gambling has become the soul of our modern society." We find her in

* *George Sand.* Correspondance, 1812-1876. Paris: Calmann Lévy New York: F. W. Christern.

correspondence with Alexander Dumas, *fils*, who compliments her on one of her plays, "Favilla" (in "Favilla" Madame Sand brings together an artist and a bourgeois who dislikes art and artists). She compliments him on his "Demi-Monde." She regrets that the virtuous girl of the "Demi-Monde" should be so little before the public, after having been so well presented to it, and that the bad woman, the *Baronne d'Ange*, true as she is to life, should be the absorbing character of the play. "I know well," she says, "that having made the 'Dame aux Camélias' so interesting, you wanted to show the reverse of the medal. Art needs those impartial studies and those contrasts which exist in life; so I make no criticism. I esteem you the first of our dramatists in the new manner, the new style, as your father was the first in the style of yesterday. I belong to the style of the day before yesterday, or of the day after to-morrow. I don't know, and don't care: I amuse myself." She became more and more enamored of the theatre, but she was not practical; as she says, she wrote her plays too much to amuse herself, for herself, without taking into account the necessities of the stage. She arranged Shakspere's "As You Like It" for the Théâtre-Français; she wrote "Françoise" and a number of other pieces. They are now all forgotten, except the "Mariage de Victorine" and "François le Champi."

Madame Sand worked too hard; she had much to forget, and work was her only way of forgetting. She felt tired at times: "I long always for *absence;* absence, for me, is the little corner where I could repose, away from all business, all visits, all domestic trouble, all responsibility for my own existence. It is what I found for three weeks, last year, at Frascati—for a week at Spezzia. Would to Heaven I might find it again for six months anywhere, under a soft sky and amid picturesque scenery—a modest dream, but which floats before me for ten years before I can realize it."

Madame Sand was not such a bitter enemy of the Second Empire that she could not write to the Empress Eugénie in a style which would have the approval of the *Court Circular*. Asking for a *bourse* for the grandson of an actress, Madame Dorval, she said: "It will be one benefit more in the precious life of your Majesty. . . . This sacred title of mother, which heaven has sanctified in your Majesty. . . . The gracious protection which your Majesty extends over all artists. . . ." It is all in this style. The Empress immediately did what Madame Sand asked her to do, and Madame Sand thanked her in the same courtly manner. This would not be worth noting if it was not an indication of a kind of political abdication on the part of Madame Sand. She had given up the game; the passions of 1848 had become quite extinct. She even enjoyed to a certain extent a state of things which humbled the upper classes, and which had flatteries for the peasant and for the workingman. She did not say so openly—there was still in her something of the old spirit; but she was not what was then called "irreconcilable." She sympathized fully with Prince Napoleon, who was, like herself, an uneasy spirit, half Prince and half democrat—a "César déclassé," as About called him in a curious article on the Salon at which Flandrin exhibited his admirable portrait of the nephew of Napoleon. When she heard of the attempt of Orsini, she writes: "I make no wishes for the shade of Orsini & Co." She writes to Prince Napoleon, March 12, 1858, thanking him for some act of kindness toward one of her friends: "You are an angel; that is certain." She always calls him "Dear Imperial Highness." She tells him: "If anything ought to console you, it is the thought that you will be beloved and appreciated by all who are still worth something." She tried to save some of the men who were exiled after Orsini's attempt, and interested Prince Napoleon in their cause. She played the part of a protector of the oppressed under the Empire, but this part imposed on her a certain sort of familiarity, and even of sympathy, with the Empire itself. She blamed many things; she did not call for a revolution.

Correspondence.

THE ACQUISITION OF OREGON.

To the Editor of The Nation:

Sir: I do not know that the following will throw any light on the origin of our title to Oregon, discussed in the *Nation* of last week, but it may be worth recording as a personal reminiscence.

Some time, I think, in the year 1845, I dined with Mr. John Quincy Adams, at his house in Quincy, and the conversation after dinner fell upon the circumstances of the treaty with Spain in 1819. I suppose it was the annexation of Texas, just then effected—or in discussion—that led the talk that way. In deciding the case of Florida, it was agreed that the boundary of the Louisiana purchase toward Mexico should be finally settled. The French and Spanish ministers were consulted, but neither of them had any definite notion on the subject. Spain claimed, by right of conquest, indefinitely north from Mexico, up to the North Pole. France claimed, by right of discovery, indefinitely west from the Mississippi, as far as the Pacific Ocean. Neither seemed to know anything about the region in question, or to care much about it. Both were evidently rather tired of the business, and inclined to take up with any reasonable proposal. A map of the country was lying on the table, and Mr. Adams, taking a ruler, *drew a pencil-line from the Pacific coast* on the parallel of 42° —the latitude of the southern boundary of Massachusetts and New York—as far as the Red River, proposing then to follow down that stream to a certain point, from which a line should be run due south to the Sabine. This was at once accepted by all parties, with evident relief, and remained our boundary till 1845.

In making this proposal, I understood that Mr. Adams had two points in view: the first, and most important, was to give this country *an undisputed claim upon the Pacific*, where peaceable enlargement of our boundaries was sure to follow in due time. He expressed, in fact, entire confidence that the United States would come eventually to occupy the whole continent, from the arctic zone to the Isthmus of Darien. The other object was to hold the line of occupation for an indefinite time *well to the north*, to prevent Southern and slaveholding occupancy, and especially (as I infer), by excluding Texas, to keep at a good distance from Mexico, and discourage such raids in future as those of Aaron Burr. Whether, by shifting his ruler a few degrees, he could have given us California, New Mexico, and Texas then and there, without the war of 1847, but with a longer lease to slavery, is not quite clear; but apparently it might have been so. J. H. Allen.

Ithaca, N. Y., April 5, 1883.

BLIND GUIDES.

To the Editor of The Nation:

Sir: In your columns attention has been called to the custom of retitling, ante-dating, and post-dating books, uncut leaves, and other matters of interest to book-buyers. I should like to speak a word for the unlearned on a similar topic. They are frequently, to their sorrow and loss, led astray in buying books by the thoughtless commendations of men whose reputations invite confidence. Undoubtedly a few sentences of praise, non commital, perhaps, are useful in putting an end to the ceaseless pertinacity of agents. But distinguished scholars at such times should think not only of their own comfort, but of that large circle of readers who place reliance on their opinions.

Let me give a case in point. Last summer, a book on antiquities by unknown writers received a large sale throughout the country. The agents continually and effectively referred to the favorable words of well-known scholars. For instance, Prof. W. S. Tyler, of Amherst, says it is "edited with a great degree of learning and judgment." Dr. Howard Crosby pronounces it "full of useful information derived from the best sources." Dr. Andrews, Professor of Greek in Madison University, is still more misleading: "It has evidently been prepared by the intelligent use of high authorities, and is marked, therefore, by an *accuracy* not often found in such compilations. In reading those parts of the book which treat of subjects pertaining to my own department, I have been gratified by the correctness of the work."

I came across the following instances of a "great degree of learning," pieces of useful information and examples of "accuracy," which, no doubt, would be not merely "useful," but most astounding "information" to the writers of these phrases. Among other things, we are told that the Laocoon group was "sculptured 3,000 years ago"; that the best authorities agree that Homer was born in the city of Melesigenes (!); that Socrates wrote the Memorabilia, or at least that part of it which details the dialogue between himself and Aristodemus; and that King Perseus fought Rome about 580 B.C. We are given a picture of an "altar 3,000 years old," yet it has a dedicatory inscription. If the inscription was later than the altar, it should have been noted by the learned and accurate editors. We are shown a "painting 2,600 years old" of an interior, but on the walls are inscriptions in Greek letters of the Roman period. On another page is the picture of a Hebrew MS. "Pentateuch, written 3,200 years ago." "It was the work of the great grandson of Aaron, as indicated." Does Dr. Crosby know of an older autograph than this? Again, the authors tell the reader that, to give him a correct idea of ancient style, they have translated from the old Greek some stories which are given just as they were written. Every one of these stories is taken from Rev. G. W. Cox's book, 'Tales of Ancient Greece.' Apart from the theft and lie, they do not give a correct idea of ancient style.

These are but specimens. But that book was praised by college presidents, professors of ancient literature, and clergymen of all denominations as an accurate and valuable work. Many who could ill spare the money were enticed by such apparently trustworthy criticisms to pay $5 for a book whose comparative worthlessness cannot long remain concealed. Have not learned men a duty in such cases—a duty which, in this instance, certainly was not done?

B.

New Haven, Conn., April 4.

WOMEN'S INTEREST IN POLITICS.

To the Editor of The Nation:

Sir: One of your correspondents lately has stated that women do not take an interest in politics. But there is another side. Not knowing any one else quite so well, I will cite my

humble self as an instance, and there are probably plenty of others like me.

My education has been desultory. My entire life has been spent on a plantation, with the exception of perhaps three years spent at odd times in the North. I take a keen interest in everything, politics among others. I assure you, in all frankness, that I very rarely meet a man, either at home or in the North, who is as well "up" in general politics as myself. Although they will know perhaps one subject much more thoroughly, they will be totally ignorant of another. So much have I found this the case that I am ashamed of what I do know, and seek to conceal it, for men do not like to be found wanting; and only when excited in discussion do I sometimes betray myself. Then people stare at me as though I were a maniac, and say, "I did not know you took *such* an interest in politics," which instantly crushes me.

I form my opinions after reading our own paper, then the other side in the New York *Times*, then the *Nation's* views, almost always adopting the latter. My political opinions are certainly not formed by my relatives of the sterner sex, for I never agree with my father, and rarely with my brother, and we are constantly having the liveliest discussions. Neither do I always agree with you, dear *Nation*, though I have been a devoted reader of yours since quite a child—for instance, your views expressed in a late review of 'Emerson at Home and Abroad.'

I am equally fond of dancing (let me whisper it—of flirting), music, art, and a little philosophy, and would take a much deeper interest in all subjects if I knew what to do with my knowledge. So we girls will welcome the Annex to Harvard, or Columbia—in fact, an annex to *everything* that will give us a chance to improve ourselves; and you must help us all you can.

D.

LOUISIANA, March 28, 1883.

Notes.

J. B. LIPPINCOTT & Co. have in press 'Calumet of the Coteau, and Other Legends of the Western Border,' by P. W. Norris.

A. D. F. Randolph & Co. will publish immediately a new edition, carefully revised, of 'The Ancient Church: Its History, Doctrine, Worship, and Constitution,' traced from the first three hundred years, by W. D. Killen, D.D., Professor of Ecclesiastical History and Pastoral Theology in the Irish Assembly College. It will contain a preface by the Rev. Dr. John Hall.

Lockwood, Brooks & Co., Boston, have ready, as the American publishers, Vol. ii. of Halkett and Laing's 'Dictionary of the Anonymous and Pseudonymous Literature of Great Britain.' Vol. iii., completing the work, will be ready in the autumn. It is both singular and sad that both the partners in this laborious enterprise should have died before their work could see the light in print.

The fifth volume in the elegant Parchment Edition of Shakspere (D. Appleton & Co.) contains "Richard II." and the first two parts of "King Henry IV."

A. C. Armstrong & Son have brought out a new and handsome reprint of the late Dean Stanley's 'Sinai and Palestine, in connection with their History,' carefully conformed to the last English edition, and including its fine colored maps of Egypt, the Sinai Peninsula, the Sinai range, and the Holy Land (in two divisions). This book, which, when first published in 1855, established its author's position in the foremost rank of scholarly and yet popular writers on sacred subjects, and which has since gone through more than a score of editions, is not likely soon to lose its hold upon the public, in spite of the changes constantly wrought by geographical exploration and Biblical criticism in our conceptions of localities and events recorded in the Scripture narratives. The charm of the Dean's warm and vivid diction will long outweigh considerations of accuracy or completeness, in which the work may here and there be found wanting.

Mr. C. G. Bush's 'Our Choir: a Symphonie . . . Opus 1881' (G. P. Putnam's Sons) consists of a number of plates, combining text and illustration, reproduced in facsimile from the author's pen-drawings. The text, under such conditions, is apt to be hard to read; and here, such is the crudity of the versification, it becomes doubly trying. Mr. Bush's humor is undeniable, but his designs and lettering are sadly undecorative, and the result is an unlovely thing.

We have received Part 1 of 'The Humphreys Family in America,' by Frederick Humphreys, M.D., of this city, and several assistants. Although this pamphlet is of a size of page (7⅞ x 5¾ inches) unusual in such works, it seems to be a mere prelude to the history of the family. The part before us treats of various families in England named Humphrey or some similar name; even embracing those entitled Umfraville, although no blood relationship between them is conceivable. Some pages are given to the subject of heraldry, and at the close we light upon John Humfrey, one of the early magnates of Massachusetts. Thus far the prelude is monotonous and suggests nothing of the second part. When it arrives we may perhaps learn something about the Americans for whom this genealogy has been prepared, and pending that information we will not suggest that the present instalment is useless.

To their Bohn series the London publishers, George Bell & Sons, have just added a new edition of Lockhart's 'Life of Burns,' with annotations, an appendix, and a sketch of Lockhart himself by William Scott Douglas (New York: Scribner & Welford). The work thus revised is very considerably improved, and the new matter is as interesting as it is valuable. Part of it discusses the paternal ancestry of the poet, and another straightens out the bibliography of the Life, which, it appears, had a fifth but never a second edition. Mr. Douglas's style is not always as correct as Lockhart's, but he was otherwise well fitted to perfect this standard memorial of Burns.

B. Westermann & Co. send us the first half (A–K) of the third edition of 'Meyer's Hand-Lexikon,' a model of condensation and of typographical neatness. A special feature of this work is the insets, printed on a straw-colored paper, which supplement certain articles, as the chronological table of geographical discovery, the table of financial comparison between the German States and other European Powers, the table of German and Austro Hungarian railroads; or explain a plate, as when annexed to the chart showing the earth's population, or to the representation of poisonous plants or noxious insects, or to the diagrams for mechanism like the steam-engine, the electric light, the telephone; or, finally, index a map with names of places alphabetized and located by latitude and longitude. Another excellent feature, if not novel, is the bibliography of the several subjects, which is fresh and intelligent. Thus Von Holst's 'Calhoun' is referred to under that statesman (whose name, by the way, we are told to pronounce *Källuhn*). Goethe has two columns on one page allowed him; Bismarck gets but one and a third columns, and even so surpasses Frederick the Great. France gets eight and a half pages, Great Britain (with England and Ireland) considerably more. Under the various countries are useful reviews of the national literature. American topics are fairly well looked after. Mr. Conkling, by the only slip we have observed, is made a judge of the Supreme Court in spite of his refusal. The little space on the shelf occupied by all this information is not its least merit.

A "Commercial Calendar," showing the lowest and highest quotations per month, during 1882, for various railroad shares and bonds, staple products, exchange, silver, etc., in a brief compass, by means of a revolving disk, has been published by John C. Welch, No. 72 Beaver Street.

We have before us Bulletin No. 1 of the United States Geological Survey: 'On Hypersthene-andesite, and on Triclinic Pyroxene in Augitic Rocks,' by Whitman Cross. Mr. S. F. Emmons, geologist in charge of the division of the Rocky Mountains, in a preface vouching for the importance of this purely technical paper, sketches the geology of Buffalo Peaks, of which a striking view serves as a frontispiece.

Bulletin No. 3 of the American Geographical Society, bearing date of 1882, though just issued, surpasses the average of this series in interest. The important exploration of the River Beni, a tributary of the Madeira, and a great rubber district, by Dr. E. R. Heath, is the subject of the first paper, the explorer giving a plain abstract of his journals. General E. L. Viele paints in dark colors Mexican life and character on the Rio Grande frontier. Two maps accompany the Bulletin. As usual, there is not the slightest indication of the connection between its contents and the proceedings of the Geographical Society.

An unusual literary partnership is that between Dr. Asa Gray and Dr. J. Hammond Trumbull in the April number of the *American Journal of Science*. They jointly review De Candolle's 'Origin of Cultivated Plants,' with the result of claiming more indigenous plants for America than the Swiss botanist allows. A second article is promised in the next number.

The meritorious *Newport Historical Magazine* closes its third volume with the number for April. Improvements are promised, and a larger support is earnestly desired. To show how wide a circle this periodical interests, we quote from a paper in the current issue on early Rhode Island settlers in New Jersey. The following pedigree has only lately been worked out, though long suspected: "Samuel Lincoln came from Norwich, England, to Massachusetts. He had a son, Mordecai 1st, of Hingham, who in turn had children—Mordecai 2d, born April 24, 1686. . . . Mordecai 2d came [as early as 1714] to Monmouth, N. J., where he married, and his oldest son was named John. They moved [about 1720] to Easton, Pennsylvania, where the father died. John went to Rockingham County, Va., and had sons—Abraham. . . . The first named of these sons, Abraham, had a son Thomas, who was the father of the martyr President."

In the March *Portfolio* (J. W. Bouton) the editor's hand is conspicuous, first in an illustrated article on "The Destruction of Cairo," next in his third paper on Paris, and last in an obituary tribute to Gustave Doré, for whose private character Mr. Hamerton expresses unfeigned respect, and whose art he judges with sympathetic discrimination. The subject of the Paris paper is the Island of St. Louis, circumnavigated. Mr. Hamerton remarks that the new Hôtel Dieu covers a site once occupied by "three churches and part of a fourth, and no less than eleven streets." A strong etching by Jacomb Hood shows the watering of horses in the Seine, which

is one of the animated and picturesque sights along that river. Those who are curious in regard to new modes of engraving should examine the illustration on page 53—a "white-line" etching, to borrow a term from the kindred art of wood-engraving.

To those who wish to combine the study of the French language with serious thinking we can recommend *La Réforme Sociale*, a fortnightly magazine published at No. 174 Boulevard St. Germain, Paris. Its name truly indicates its character, but does not imply the readability which this periodical possesses. Its articles are always intelligent and often stimulating, even when the subjects are rather exclusively French, as is by no means the case with all. The issue for March 15 contains a capital picture of the character, home, business, and belongings of a merchant of Troyes, in the time of Henry IV., based on his will and the accompanying inventory.

Fifteen thousand francs were raised towards the gold medal got up for the 60th birthday of the chevalier G. B. de Rossi, and presented to him by his admirers on Dec. 11, 1882. America, we are glad to see, was not wanting from the list, and outdid Greece, Portugal, and Spain in the number of subscribers. The promised commemorative album has been distributed.

The new 'Life of De Morgan' furnishes this interesting addition to the list of fictitious authors: "Seven-Figure Logarithms of Numbers. . . . Trans. of Ludwig Schroen Siebenstellige. Gemeine Logarithmen der Zanten (*sic*)."

Sundby and Baruël's "Dansk-Norsk-Fransk Ordbog," of which seven or eight parts have appeared, goes as far in the use of signs as Q. P. Index. If a word is ornithological, a little figure of a bird, resembling an Egyptian hieroglyphic, and about as large as a capital letter, takes the place of the usual abbreviation "ornith." A fish stands for ichthyol.; and a flower, a music note, an anchor, two swords crossed, are equally easily interpreted; a crown in a circle (a piece of money) is for numism., a caduceus for commercial, a toothed wheel for technical, and a book for didactic. A †, the usual sign for death, means obsolete; and, most ingenious of all, a comet signifies unusual. The signs are so easily understood that they are easily remembered. It is curious that orthography, which began with sign-writing, should have come round to it again in a sort of second childhood.

Among the editions of Molière which continue to pour from Parisian presses in ceaseless profusion, and to a few of which we have been able to refer, none begins to equal in lavish artistic adornment that to be edited by M. Anatole de Montaiglon (Paris: Lemonnyer; New York: F. W. Christern). It is to contain brief commentaries, and its text is to be an exact reproduction of the original editions, adorned with more than 700 new and original illustrations by M. Jacques Leman, among them 32 full-page plates, 150 head-pieces, as many tail-pieces, and more than 160 entirely different initial letters. This sumptuous edition of the greatest of French dramatists will appear play by play, to be bound finally in eight or ten volumes. The illustrations are all on copper, and the price of the whole work varies from 500 to 1,500 francs.

—In former days, it is said, young women in New England spoke of the limbs of a piano, the word legs being too great a trial of their modesty. The *Saturday Review* and some other English writers have laughed at this enough to give an American a certain satisfaction in the Bowdlerist character of Bishop Wordsworth's new edition of Shakspere. He cannot stomach "thigh"; "the breasts of Hecuba when she did suckle Hector" offend his sight; "harlot" is an abomination to him. These scruples are a little like the dash which printers still think it necessary to put after the "big, big D"; but, after all, what can be done? The custom of reading Shakspere aloud in the family circle has fortunately not entirely vanished from the land; Shakspere Clubs, though not so flourishing, for some occult reason, as ten years ago, are still numerous. It is very inconvenient in reading aloud in mixed companies to come upon phrases which society at present has agreed to taboo. Call it foolish, squeamish; say that there ought not to be any feeling in the matter; the fact remains that there is, and therefore, for some purposes, the Wordsworthian expurgations may have their use.

—A little over a year ago the French Minister of Public Instruction, at the suggestion of M. de Ronchaud, Director of the Louvre, reëstablished the courses of instruction in the National Museums which had been for many years intermitted. At the foundation of the Egyptian Museum in 1826, there was attached to it a course in Egyptian, which for six years was conducted by Champollion. The idea of a system of special studies, carried on in the presence of the monuments, has now been revived and the plan enlarged, and a pamphlet just issued by Ernest Leroux ('Discours d'ouverture de MM. les Professeurs de l'École du Louvre') contains the opening lectures of the first semester of 1882-83. These are as follows: "On the Demotic Language," by Eugène Revillout, Adjunct Conservator of the Egyptian Museum; "On Egyptian Archæology," by P. Pierret, Conservator of the Egyptian Museum; "On Egyptian Law," by Revillout; "On Semitic Epigraphy," by Ledrain, who is connected with the Oriental antiquities of the Louvre; "On National Archæology (two lectures)," by Alexandre Bertrand, Member of the Institute, and Conservator of the Museum of St. Germain. These lectures, valuable and interesting in themselves, are still more interesting as introducing the system of study which they represent. It is an admirable idea to convert the Louvre into a University. Might not the British Museum be utilized in the same way? In this country, unfortunately, we have not the material for such a method of work, except, perhaps, in the departments of palæontology and American antiquities.

—We have space for a brief notice only of the lectures. Revillout, in his first lecture, defines the Demotic language, points out its linguistic value as intermediary between the Old Egyptian and the Coptic, and gives specimens of its literature, especially from the remarkable work which he calls 'Philosophical Conversations between the Kufite Jackal and the Ethiopian Cat,' in which the latter represents orthodoxy, and the former philosophical scepticism, with an admixture of Darwinism. In his second lecture he gives a sketch of the development of Egyptian law. Pierret's lecture is devoted to the Egyptian religion, on its philosophical and its mythological sides—its monotheism, its developed solarism, its animal-worship, its idea of a future life. Ledrain, in his short discourse, announces the somewhat startling proposition, that the principle of the North-Semitic religion (borrowed from the non-Semitic Sumerians) was dualism; proof of which he finds in the engravings on various seals and coins, where are figured lions or bulls, and gazelles or goats, the former solar symbols, and representatives of good, the latter, as animals which feed on and destroy the sacred trees, symbols of evil (by others these figures, including the lion and the unicorn in the English Royal Coat of Arms, are regarded as representing the contest between the sun and the moon). But it seems to be going too far to find in representations of good and evil powers, which exist in all religions, proofs of a probably dualistic system. Bertrand, after stating the general problems of French archæology, discusses the tertiary and the quaternary man, deciding against the former, and for the latter. The lectures, written with French clearness and freshness, give promise of excellent results for the work of the semester.

—The *Deutsche Rundschau* for March prints an address by Professor Du Bois-Reymond on "Friedrich II. in englischen Urtheilen" (English Opinions of Frederick II.), delivered before the Berlin Academy of Sciences on the anniversary of the birth of its royal founder. The day coincided with the celebration of the silver wedding of the Crown Prince, and the subject was undoubtedly chosen with special reference to the Crown Princess's nationality. Viewed as an historical composition, the lecture is a rather superfluous glorification of Frederick the Great, and, if intended as a tribute to an English Princess, singularly ill-timed; for while at the outset Prof. Du Bois-Reymond dwells on the blessings which have resulted to Prussia from her connection with the Guelphs of England, and even for a moment indulges in speculation as to what would have been the consequence if Frederick II., too, had allied himself with an English Princess, he soon proceeds to sound the key-note of his address—the characteristic inability of the English to appreciate Frederick's greatness. It is a defect not observable among the French, "even when their national sentiment was most overwrought." Among the literary manifestations of this British prejudice, Macaulay's 'Essay on Frederick the Great' naturally excites Du Bois-Reymond's greatest ire. In itself, as occupying "probably the lowest rank among Macaulay's writings," it is not of great importance, but it is typical of the insular prejudice of the British, "who value other nations only in so far as they are, or may be, useful to them." The principal English reproach against Frederick II.—his conquest of Silesia—Prof. Du Bois-Reymond answers with the *tu-quoque* argument: that the doings of the East India Company at the same time were even worse. Lecky is also taken to task for presuming, in his 'History of England in the Eighteenth Century,' to find fault with Frederick's alleged lack of German patriotism. "What right has Mr. Lecky to be more sensitive in this respect than Goethe and Schiller, Herr Emanuel Geibel or Herr Wilhelm Scherer?" In contrast with Macaulay's "utilitarianism," Carlyle's "idealism" was much better fitted to appreciate Frederick's greatness, although "even he was a stranger to the King's real intellectual nature." Carlyle also incurs Du Bois-Reymond's displeasure for calling Frederick, at the close of his book, "the last of Kings." "Carlyle wrote this before 1866; after 1870 . . . he would not have written it. What Frederick prepared, the third great Hohenzollern, Emperor William, finished. And to-day one may well feel assured that the series of great monarchs of that dynasty is not yet at an end." But it is easier to point out Du Bois-Reymond's perfervid patriotism and overflowing loyalty than to do justice to the charms of his diction and the evidences of his familiarity with English history and literature, which render this address as attractive as is everything emanating from his pen. Most of the other articles in this number of the *Rundschau*—"Schiller," by Prof. Wilhelm Scherer, "The German Dynasty in Rumania," the instalment of "Stories from Two Annexed Countries by a German Officer," and the novel, by Wilhelm Berger, the scene of which is laid in France

at the time of the late war—are on subjects of chiefly German interest.

—A Transcaucasian correspondent of the München (lately Augsburg) *Allgemeine Zeitung* communicates some interesting ethnographical details concerning the Turkomans of Merv and their oasis, based on fresh information obtained by the Geographical Society of Tiflis. They will be found confirming in the main, as to the character of the Tekke Turkomans, the statements made by O'Donovan in his book on 'Merv,' recently reviewed in this journal. According to that information, which, in view of the unchecked access to the territory lately gained by Russians, may be deemed specially trustworthy, the oasis of Merv embraces a little upward of two thousand square miles, fully four-fifths of which is cultivable. It is watered by the river Murkhad, about two hundred and eighty miles long, and an entire system of large and small canals branching off from it. Artificial irrigation is the more needed as not a drop of rain falls from May to September, a season of terrific heat. In early winter, however, snow covers the ground for about twenty days; in February the temperature rises rapidly. Water is wealth in the oasis; it serves as a standard of riches, and is bestowed on chiefs as a reward for services. The population is comparatively dense, numbering nearly two hundred and fifty thousand, and rather poor. No permanent taxes are paid; the *mejlis* determine the amount from time to time; the executive is in the hands of three khans. Many trades are cultivated; the silversmiths and workers of arms are very skilful; beautifully ornamented carpets are woven by women, and exported into Turkey, where they are valued more highly than the Persian manufactures. The women dress almost like the men. Instead of arms they wear silver trinkets in the belts over their gowns. The Merv ladies are not remarkable for beauty, but wives are bought at a high price in money, lambs, and camels. The coarse gluttony of the Mervians, of which O'Donovan has so much to tell, and their thievish and robbing propensities, are also dwelt upon in the Russian reports; but the latter vice is said to characterize only their dealings with strangers, while theft practised on men of their own tribe is regarded with abhorrence. Striking instances of Turkoman honesty are related.

—Dr. Robert Koch, the present head of the Imperial German Health Bureau at Berlin, was a very few years ago an obscure physician in a Prussian country town. Within the past year, owing to his discovery of the now generally accepted *bacillus tuberculosis*, his name has undoubtedly been spoken and written more often by his professional brethren in civilized countries than that of any other member of the medical profession; and justly so, for Koch's discovery of a bacillus of tubercle, whether leading to fruitful or barren conclusions, was but the legitimate offspring of much previous admirable and faithful work, in the course of which he developed the best method of cultivating microorganisms so as to be able to attain unmixed cultures of the different varieties—the method of embedding them in gelatine. Pasteur's method—that of cultivating these organisms in sterilized liquids—is by no means so reliable. The superior accuracy of Koch's methods has led to a perhaps inevitable controversy in print between these two men, who may fairly be regarded as the two most distinguished mycologists of the day—the one representing a German, the other a French school of experiment. Such a controversy has been pending since Pasteur's appearance before the International Congress of Hygiene at Geneva last September, somewhat in the character of the modern Jenner. Dr. Koch, in fulfilment of a promise there made to reply in print to the remarks of M. Pasteur at that meeting, has put forth a brochure entitled 'Ueber die Milzbrandimpfung' (Kassel: Theodor Fischer). It is a fine example of strong, scientific polemical writing, and the glimpses it gives of Koch's methods of research afford a striking view of the thorough and painstaking character of the best laboratory work in Germany at the present day.

—The poet Zhukovski, the hundredth anniversary of whose birth was lately celebrated in Russia, was the leading writer of his nation during the period of transition from classicism to romanticism. For a time he acted as a champion of romanticism, and was as such warmly combated and admired; but though his poetry was not of the tame, orthodox pattern of the period of Derzhavin, it never took a high flight, and he was too much of an imitator and translator to become a pathfinder in a new domain of the intellect. He was the warm friend both of the classical prose-writer Karamzin and of Pushkin, the real inaugurator of the new literary era; but survived the former thirty years, and the latter sixteen. Zhukovski excelled in almost every kind of poetry, but chiefly as a writer of ballads and lyrics. When a youth he acquired fame by the translation of Gray's 'Elegy,' and shortly before his death, in 1852, he translated Homer's 'Odyssey.' In 1812, when he fought against the French invader, he wrote famous martial songs, and in 1849, when broken down with age and a morbid pietism, he sang his revered patron's, Czar Nicholas's, victory over the Hungarians. His verse was exquisitely finished and purely Russian. He generally chose soft, and often elegiac, topics. His character was feminine, and his sentiments were noble, but he remained to the end an admirer of Czardom, and was tormented in his last years by the advance of revolutionary ideas. He had become estranged from the younger generation of his people, and is now esteemed chiefly as the preceptor of the Emperor Alexander II., upon whose mind he exercised a very beneficial, humanizing influence. Zhukovski was the illegitimate son of a country nobleman by a Turkish captive, studied at the German University of Dorpat, in Livonia, became reader to Nicholas's consort, and in 1818, when the future Alexander II. was born, educator of the Grand Duke, which he remained till 1840. He subsequently travelled in Germany, where he also spent the evening of his life, in the company of a young wife, a religious enthusiast and self-tormentor like himself.

—Mme. Patti does not like to be classified with those vocalists whose proper and exclusive sphere is the playful, vivacious, debonair. To a friend who thus classified her, twenty years ago, she replied, with a toss of her head, "I am not a buffa." Even after a performance of "Don Giovanni" she exclaimed, passing over his praise of her *Zerlina*, "I should prefer to sing *Donna Anna*, and I shall yet sing the part." To the best of our knowledge she has never kept this promise. *Rosina* in "Il Barbiere" and *Zerlina* in "Don Giovanni" are still, in their totality, her best characters. In these her acting is no less spontaneous and graceful than her singing. In some of the semi-tragic operas of Verdi and Donizetti her art is much better shown on the vocal than on the histrionic side, while in an opera like "Faust" she fails to give satisfaction either as vocalist or actress. She has, therefore, followed a wise instinct in avoiding the part of *Donna Anna*, and if she should ever carry out her intention of appearing as *Elsa* in "Lohengrin," she will commit the greatest error of her artistic life. On Friday her *Zerlina* was seen for the first time in New York, and was immediately recognized as the best *Zerlina* that has ever appeared here. She sang Mozart's music with charming simplicity and purity of style, and precisely as it was written—a point that calls for special mention, as most of our Italian singers, especially the tenors, have a vicious habit of transposing every final note an octave for "effect"—*i. e.*, for the applause of the *vulgus*. In her acting she introduced such a large number of delicious touches, entirely her own, that the most blasé opera-goer must have felt rejuvenated for the moment. She presents a perfect picture of the artless maiden who unites with an honest anxiety to avoid offence to her bridegroom a coquettish desire to please the gay young man of the world, which the simplest country girl shares with the accomplished city flirt. Frau Lucca is an admirable *Zerlina*, but in this instance she must yield the palm to Mme. Patti, although it should be added that Mme. Lucca is equally great in the part of *Donna Anna*. This rôle was on Friday taken by Mme. Fursch-Madi, who sang it with excellent dramatic spirit. Everything else was, unfortunately, so far below mediocrity that it would be absurd to criticise it in detail. The scenery looked as if it had been that used at the first performance of this opera a century ago The house was full, and in spite of the wretched ensemble the audience took some interest in the performance. With a good cast and fine scenery "Don Giovanni" would doubtless become as popular in this city as any opera; and it would afford a most grateful change from the dreary old repertory, with its faded hothouse melodies. "Don Giovanni" was, of course, given without Mozart's original and undramatic second finale; but some attempt might have been made in its place to suggest the hero's infernal destination, instead of tamely allowing him to disappear down a trap-door, without so much as the flame of a torch to indicate his fate.

—On Saturday the last Philharmonic concert of the season was given at the Academy of Music, before the usual overflowing and discriminating audience. The programme contained no absolute novelty, but two of the numbers must have been new to a large portion of the audience, as they have not been played in New York for some years. One of these was Fuchs's Serenade in D, op. 9, for string orchestra. The first two movements of this composition are rather poor, the last is fairly interesting, while the third and fourth are very fascinating. The applause bestowed on these movements was in exact proportion to their beauty and originality—a phenomenon rarely to be observed in a concert hall. Bargiel's "Medea" overture was also welcomed by those who would like to hear more of this gifted composer, whose chamber music, especially, ranks with the best in existence, although it is strangely neglected by our local clubs. The "Medea" overture is beautifully scored, and the details are often very "suggestive," reminding one in this respect of Schumann, Bargiel's prototype. Schumann was represented on the programme by his magnificent A minor concerto, which was interpreted by Mr. Joseffy. At the rehearsal Mr. Joseffy did not appear to be in the proper mood for doing full justice to this great work; but at the concert he seemed to be, like Rubinstein, inspired by a demon that revealed to him all the subtle *nuances* of rhythmical and dynamic shading, and gave him the physical power to reproduce the full grandeur of the opening and closing movements. Such playing as this makes one forget that a piano is not suited for a large hall, and can only with difficulty be made to blend harmoniously with the

orchestra. It did on this occasion blend as easily as a harp, and the result was a rare musical treat. Mr. Joseffy was, of course, recalled, and obliged to add a short solo piece. This was followed by the "Ocean" symphony, the performance of which was no less marvellous than that of the concerto. Only five of the seven movements of this gigantic work were played, and among those omitted was unfortunately the lovely Scherzo. In its place was put the new Lento assai preceding the Adagio. As the new movement is exceedingly long, and the Adagio not short, a feeling of monotony was produced, which could be easily obviated at future performances by restoring the Scherzo and dropping the Adagio, which is in every way inferior to the Scherzo. The two Allegros—maestoso and con fuoco, with the chorale—are among the most superb of all symphonic movements, and with the Scherzo and Lento they would constitute a symphony that cannot be heard too often. The new movement is of a more realistic and descriptive character than any of its predecessors. It depicts the turbulent movement of the waves, the shrill whistling of the storm wind, and the clap of thunder. The musical means employed are curiously similar to those of the "Flying Dutchman," which will probably forever remain the most truthful orchestral translation of a storm. Wagner's influence is also to be distinctly traced in the Adagio non tanto, in which the wavy accompaniment of the 'cellos is copied from the *Waldweben* in "Siegfried." One disadvantage of having descriptive music on the concert stage was brought into prominence on Saturday. It produces almost a comic effect to *see* the cause of thunder in the shape of an athlete beating a huge drum with all his might and main. The correct thing to do, in our opinion, would be either to use actual stage thunder, or to have three or four big drums at some distance and out of sight. In such a case the imagination is the only true source of emotion.

MISS EDGEWORTH.

A Study of Maria Edgeworth. With Notices of her Father and Friends. By Grace A. Oliver. Boston: A. Williams & Co. 1882.

To the earnest novel-reader few things are more offensive than the combination of Miss Edgeworth's name with that of Jane Austen. They were the two best female novel-writers of their day. But Jane Austen is a real, though perhaps the humblest, member of a highly select circle. In common with Homer, Shakspere, Cervantes, Scott, and perhaps two or three more, she has the power, almost inconceivable to those who do not possess it, of creating characters and endowing them with a life of their own from which all their actions and sayings naturally flow. Miss Edgeworth has not this power: she paints character as it presented itself to her view, sometimes well and sometimes ill, but her men and women have not a life in themselves. Her short tales are excellent, and superior to her novels, for the reason that the things required in a short tale are incident and moral point, not character. In the invention or adaptation of incident she is very clever; she also has a large share of the faculty, most conspicuous in Defoe, of giving fiction the air of reality by minute elaboration of detail. She writes decidedly well, and often says witty or sparkling things, of which but few are to be found in Jane Austen. Like the rest of her privileged class, Jane Austen very seldom speaks in her own person: we can hardly gather more of her opinions from her writings than we can gather of those of Homer from the passage in the 'Iliad' where he shows his feeling against the demagogism of Thersites, or of those of Shakspere from the criticism on the playwrights and actors of his time in "Hamlet." Near as Jane Austen is to us chronologically, the history of her life not having been recorded nor her letters preserved, we know almost as little of her personally as of Homer or Shakspere. Miss Edgeworth, on the other hand, is constantly before her readers; she is always dissertating and moralizing, if not in her own name, most palpably by the mouth of one of the personages in the novel—always showing her puppets, while Jane Austen's characters display themselves. A small example is as illustrative as a great one. Let the passages of 'Emma' in which the garrulous Miss Bates becomes confused in her talk and mixes incongruous subjects together, be compared with the passage of 'Helen' in which Granville Beauclerk's flightiness of mind produces a somewhat similar jumble in his diary, and the truth of the distinction between creating and painting will probably be felt. In two things Miss Edgeworth and Jane Austen are alike: both of them take their subjects from the society around them, and neither of them can be said to portray passion—Miss Edgeworth, of the two, attempts the higher flight in that direction. She, once at least in her life, knew love; whether Jane Austen ever knew it, we cannot tell.

About Jane Austen, as we have said, hardly anything is known. The Life of her by her nephew, Mr. Austen-Leigh, is, for want of materials, a *caput mortuum*, and only proves the rapidity with which recollections fade even in the very circle of the family. Of Maria Edgeworth, we have in the work before us an account which gives us a clear idea of her character, and tells us as much as we need to know about the people among whom she lived, and the circumstances under which she wrote. A literary life can hardly ever be eventful—the writings in such cases are the history; it is the function of the biographer to collect whatever may help us to appreciate the writings; and if he is wise, he will keep his work within a moderate compass. Mrs. Oliver has kept her work within the moderate compass of a single crown-octavo volume, and she seems to us in all respects to have done it well. It is perhaps by the pictures of Irish life and character that Miss Edgeworth is specially known. In 'Castle Rackrent,' 'The Absentee,' and her other Irish tales, as well as in the 'Essay on Irish Bulls,' she did for Ireland almost what Scott did for the Highlands. But she was almost as little of an Irishwoman as Scott, or as the English monarch whom he induced to masquerade at Edinburgh in kilt and philibeg, was a Highlander. It adds to the confusion of the Irish imbroglio, that the very nomenclature is equivocal and misleading. A name borne in common by acid and alkali would hardly perplex the chemist more than the historian and politician are perplexed by the name which is borne in common by the Teutonic invaders of Ireland and the conquered Celts. Between the Scottish Presbyterian of the North of Ireland especially, and the Catholic Celt of Munster and Connaught, both the contrast and the antagonism are as strong as between any two sets of people in the world; and of the various conjectures which fancy has bred respecting the probable course of Irish history in the absence of imperial rule, not the least likely is that the victors of Londonderry would, in spite of their inferiority in numbers, have driven the vanquished into the sea.

The Edgeworths of Edgeworthtown, in County Longford, were a family descended from the English immigrants of the Tudor period. In Maria's time they were, unlike many Irish proprietors, resident on their estate, and doing their very best for the people. But, as usual, antipathy of race and religion was too strong to be much softened by kindness, however generous and persistent. Mrs. Farrar, being on a visit to Miss Edgeworth in 1836, went with her friend to the village to see the schools and improvements in the buildings made by the family. "As we passed," she says, "through the crowd to the school-house, the enmity of the Papists to Protestant landholders was but too evident. Though Mrs. Edgeworth had been the Lady Bountiful of the village for many years, there were no bows or smirks for her and her friends, no making way before her, no touching of hats or pleasant looks. A sullen expression and a dogged immovability were on every side of us." Miss Edgeworth shared the perils of the hideous rising in '98, of a local episode in which there is a vivid picture in this volume. Yet her heart was very warm toward the Irish people. She intensely sympathized with them in their sufferings under the accursed system of absenteeism; and if her delineation of their character is highly comic, and therefore disrespectful in the eyes of those to whom comic treatment seems insulting, it is free from the slightest tinge of malice. Its truthfulness has been universally admitted by those best qualified to judge, Sir Jonah Barrington among the rest. As to "Hairtrigger Dick" or the absentee landlords, nobody cares how much they are caricatured. According to one of Miss Edgeworth's social critics, who is quoted in this volume, she had even herself imbibed the peculiarities of the Irish mind to such an extent as not only to please by the raciness of her Irish wit, but to repel by the excess of her Irish "blarney." Her letters, however, do not, so far as we can see, bear out this charge, or go beyond the fair limits of mutual admiration. Of her thorough familiarity with country-life in Ireland, proofs everywhere abound. When she wants to describe the *jigging* motion of a steamboat, she compares it to the shake felt in a carriage when a pig is scratching himself against the hind-wheel while waiting at an Irish inn-door. To those who have often waited at an Irish inn-door, what a picture of that Arcady do these words conjure up! Maria is an Irishwoman, too, when she describes herself, without any comic intent, as "doing nothing but idling, and reading, and paving a gutter and yard to Honora's pig-sty *and* school-house." Not seldom she is helpful to history. We get from her 'Absentee,' for example, what, no doubt, is a true account of the effect of the Union on the society of Dublin—the break-up by the removal to England or to the country of the exclusive circle of old aristocracy, the arrival of new families of a high social position, and, in the end, a mixture of the two elements, which, to Miss Edgeworth, seemed an improvement.

Next to her residence in Ireland, the thing which had most influence on Maria's mind as a writer was her intellectual relation to her father, to whom she was tenderly attached, and who was not only her guide and friend so long as he lived (and he lived to old age), but her philosopher, her critic, the part author of her essays, and the inspirer to no small extent of the rest of her early works. Mr. Edgeworth was a very worthy man; he was an Abdiel of conscientious residence amid a host of absentees. He was also a man of most active mind, a social and educational reformer, an agricultural improver, a mechanical inventor. His intimacies were with men of science and with such social philosophers as Day, the author of 'Sandford and Merton,' and Mrs. Barbauld, who became his daughter's bosom friend. An angry reviewer in the *Quarterly*, admitting his virtues as a landlord and the father of a family, has spoken very disparagingly of his intellect and his social qualities, saying that he was superficial, a

dabbler in every kind of knowledge without being well-founded in any, devoid of originality as a mechanician, and in society "as disagreeable as loquacity, egotism, and a little tinge now and then of indelicacy could make him." But his conduct as a public man had also displeased the *Quarterly;* and if in the eyes of those critics you were heterodox in politics, the bees of Plato would have settled on your lips in vain. No doubt the philosophic and reforming squire of Edgeworthstown appeared to the greatest disadvantage before that apparently easy, yet intensely fastidious and critical, society in which it is perdition to make yourself a bore. By her father and his 'Sandford-and-Merton' associates, however, Maria was thoroughly impressed with the notion that usefulness must be constantly kept in view, and that all her writings must have a good moral. An author possessed with this idea may produce good tales. 'Murad the Unlucky; or, The Lottery-Ticket' loses none of its sprightliness or interest by being a moral lesson as well as a story. Tales are very like fables on a large scale. But all admit that utilitarianism is ruin to fiction of the higher kind. Jane Austen is entirely free from it; she has been censured by foolish critics on that account. Like life itself, her stories and those of all great novelists have their moral, which must be read as we read the moral of life. In reply to some remarks of Mrs. Inchbald on 'Patronage,' Miss Edgeworth says: "We are in the main of your opinion, that Erasmus and his letters are tiresome; but then please to recollect that we had our moral to work out, and to show, to the satisfaction or dissatisfaction of the reader, how in various professions young men may get on without patronage. To the good of our moral we were obliged to sacrifice: perhaps we have sacrificed in vain." "We" includes her father, who is at her elbow, and the unfortunate conviction which they held in common could hardly have been expressed in plainer terms.

> "In short, she was a walking calculation,
> Miss Edgeworth's novels stepping from their covers,
> Or Mrs. Trimmer's books on education," etc.

So writes Byron of Don Juan's too-learned mother. Madame de Staël is reputed to have said "que Miss Edgeworth était digne de l'enthousiasme, mais qu'elle s'est perdue dans la triste utilité." On hearing this, Mrs. Oliver tells us, Madame de Staël's daughter, Madame de Broglie, exclaimed: "Ma mère n'a jamais dit ça; elle était incapable." We agree with Mrs. Oliver that the disclaimer, though polite and dutiful, is not conclusive. It is difficult to see why Madame de Staël should be thought incapable of saying in a rhetorical and exaggerated way that which had in it a good deal of truth.

In the letter to which we have just referred, relating to 'Patronage,' Miss Edgeworth speaks with rapture of Mrs. Inchbald's appreciation of the character of Oldborough, saying that her father had placed his dependence on it, and that if it had failed to please Mrs. Inchbald they would all have despaired. In that case the old gentleman's powers as a critic must have been limited, for the character of Lord Oldborough is one which, if it amuses, amuses only by its extravagance. The Grand Mogul on a pack of cards is about as true a portrait of a British statesman. His lordship is described as wielding despotic power over a prostrate world of dependents, and demeaning himself on all occasions like a highly irascible caliph. Displease him, and at once off goes your head. The messenger whom he sends with a note dares not stay to answer a single question, because, when Lord Oldborough's command has gone forth, delay is death. His lordship discovers, through some correspondence in cipher which has fallen into his hands, and has been deciphered for him, that seven of his colleagues in the Cabinet, the initial letters of whose names make up "Cassock," have been conspiring against him with some German power; an incident unique in British, and perhaps in any, politics. He forthwith writes a peremptory letter to the King demanding the instant dismissal of six of the offenders, the seventh, who is Prime Minister, being generously spared in consideration of a recent improvement in his conduct. The answer to such a missive would have been a commission *de lunatico.* The typical man of the world, as Lord Oldborough is intended to be, always eschews pomposity. But this is the style in which his Lordship holds forth to a person whom he is installing as his land-agent:

"Since you are going to take charge of my business, sir, it is fit you should know my views relative to my affairs. In my present situation, with the favor I enjoy and the opportunities I command, it would be easy to make my fortune whatever I pleased. Avarice is not my passion. It is my pride not to increase the burdens of my country. Mine is a generous country, ever ready to reward her public servants, living or dying. But whilst I live, never will I speculate upon her generosity; and when I die, never shall my heirs appeal to her compassion. My power being at its zenith, and my character being known, I can afford to lay aside much of that adventitious splendor which adds nothing to true dignity. Economy and dignity are compatible—essential to each other. To preserve independence, and consequently integrity, economy is necessary in all stations. Therefore, sir, I determine—for I am not stringing sentences together which are to end in nothing—I determine at this moment to begin to make retrenchments in my expenditure. The establishment at Clermont Park, whither I have no thoughts of returning, may be reduced. I commit that, sir, to your discretion."

It is curious that the Edgeworths could see so much as they saw of society, and approach as near as they did to the verge of political life, without becoming sensible of the absurdity of such a picture. Not the least grotesque touch is that which implies a belief, several years after the impeachment of Lord Melville, that a British Minister was at liberty to increase his private fortune to any extent he pleased by dipping his hands into the public Treasury. The characters of the Falconer family, with their sycophancy and their unscrupulous pushing and intriguing, are better painted than this, which the artists took for their masterpiece. But here, as elsewhere, the writer is so vehemently on the side of virtue, and so determined to drive the moral home, that she rains fire and brimstone upon the wicked till she puts our sympathies on their side. Perhaps it is rather a dangerous part of novel-reading generally, but it is apt to render us too charitable toward the children of perdition, who make all the fun. The characters of the Falconers are also overdrawn. People of the world sin, but they sin within the limits of discretion and taste which their experience of the world prescribes: they do not commit forgery, or, as diplomatists, sell their Government, any more than they assassinate or steal. The character of Caroline Percy has its admirers; but she seems to us little better than an insipid seraph. Mr. Percy is Mr. Edgeworth himself, idealized, but not made amusing. It is in incident and in lively writing that 'Patronage' is strong.

Of 'Helen,' Mrs. Oliver remarks that, "being written long after Mr. Edgeworth's death, it serves to reveal something of the effect which the father had on his daughter's writing." It shows, in Mrs. Oliver's opinion, "a lighter hand, a greater ease in handling dialogue, and a more natural inconsistency in its characters than she was allowed by her father." That the old gentleman's philosophy was in part to blame for the fatal consistency of the characters in previous novels, and for their being, as they are—except where the rich vein of Irish life comes in—rather abstract virtues and vices than men and women, is very likely. But the increase of lightness and ease in handling dialogue is more probably traceable to the fact that Miss Edgeworth's success as a writer had thrown open to her the best society of London and other centres. She had heard great men of the world talk, and learned that they did not talk like Jupiter or Lord Oldborough. Still, we cannot help differing from Mrs. Oliver, who pronounces Lady Davenant a very real character. She is a perfect dragoness—a Lord Oldborough in petticoats; her virtue and wisdom are so overpowering, her tirades are so awful, that in her presence every one would sit upon the edge of his chair and feel as if he were before the Great White Throne. The only occasion on which she descends to the level of human nature, and ceases to be odious, is at the end of the tale, when she drops upon her knees to implore her son-in-law's forgiveness for his erring wife. Beauclerc, also, to whose character Mrs. Oliver extends the same praise, seems to us to be made up of inconsistent oddities almost mechanically pieced together, and to be without real life as a whole. Besides, did any young English gentleman ever hold forth to a party in a country house in such a style as this?—

"Yes, sooner would I believe in all the fables of the Talmud than be without the ecstasy of veneration. It is the curse of age to be thus miserably disenchanted—to outlive all our illusions, all our hopes. That may be my doom in age; but in youth, the high spring-time of existence, I will not be cursed with such a premature ossification of the heart. Oh! rather, ten times rather, would I die this instant!"

Helen herself is a good, lovable English girl, and, if she had only some of the little weaknesses of Emma, and, like her, got into some scrapes, she would perhaps be not less charming; but she is little more than a virtue. The best character in the piece is that of Lady Cecilia, who has weaknesses and does get into scrapes, while her affectionate nature preserves our sympathy. Whether it be that the pressure of the paternal imprimatur is withdrawn, or that years and social experience have given acuteness and confidence, there are perhaps more smart things in 'Helen' than in the earlier works: "After this curse of forgiveness, my dear, I will wish you a good night." "Lady Cecilia was charming, and everything was delightful, especially the cold chicken." "How much we owe to such men as Mr. Churchill [a cynical wit], who make us feel detraction virtue." "The not contradicting a person who is abusing himself, is one of the most heinous offences against self-love that can be committed." "Helen never indulged in the self-triumph of 'You see how right I was,' which implies, 'You see how wrong you were.'" On the other hand, the Moral Essayist has not ceased to intrude. The incidents are, as usual, well contrived, and carry the reader on. Pictures of character in the manner of George Eliot, pictures of scenery in the manner of Mr. Black, are very admirable; but, after all, the common reader likes a story to be a story.

We have spoken of the excellence of Miss Edgeworth's style: it is as good in her letters as it is in her books. Her descriptions of the things and people she sees in her times are capital. The account of her visit to Madame de Genlis at the Arsenal is a gem in its way. One only wishes that she could have drawn from Madame more of those personal recollections of the Revolution of which history has too few. As a writer of Memoirs she would evidently have been first-rate; and we cannot help half wishing that destiny had assigned to her that part, instead of one in

which she is not first-rate, though she deservedly ranks high.

THE CARLYLE-EMERSON CORRESPONDENCE.

The Correspondence of Thomas Carlyle and Ralph Waldo Emerson. 1834-1872. 2 vols. Boston: James R. Osgood & Co. 1883.

THE correspondence between Emerson and Carlyle, extending over a period of some forty years, is remarkable for what it does not, as well as for what it does, contain. As a correspondence between two of the foremost writers of their time, it might be expected to be of considerable literary and speculative interest, to present a picture of their theories as to literature, its canons, its relation to life, its past and future. But as a matter of fact, the correspondence is nearly devoid of interest of this sort. This is the more singular as a great part of it relates to Carlyle's books—not only to negotiations with publishers for their sale, but to curious confidential descriptions of the toil and agony which he suffered in bringing them forth, given, however, in terms which suggest to the reader not so much intellectual or literary difficulties, as acute physical suffering of some kind. Emerson had from the first a deep and unaffected admiration for Carlyle, and spared no pains to introduce him to the notice of readers on this side of the Atlantic. So far as one man could do such a thing, he created a market for him in this country when he had almost none in his own. We find him in the correspondence urging Carlyle to put him to use; making bargains, which must have involved much thought and trouble, with the publishers; taking such measures as could be taken to protect him from piracy; getting the publishers' accounts carefully examined and verified; and in a thousand ways doing for Carlyle the inestimable services of an unusually warm and unselfish literary friend. On his side, Carlyle professes the warmest admiration for Emerson; declares that from him almost alone among human beings does he get real sympathy. And yet, for literary or speculative interest, the correspondence is almost a blank. So far as Emerson is concerned, this is due in part to the indifference shown by Carlyle as to the topics of most interest to him. Emerson would apparently have been glad to pour out to his friend his views of one kind and another; but for his speculations Carlyle cared nothing. Such indifference, of course, would have a chilling effect on any correspondent—most of all, on one so sensitive as Emerson. But the curious part of the matter is, that Carlyle's side of the correspondence is as devoid of this kind of interest. He frequently alludes to the necessity of giving his message to the world, but never tells his friend what it is; and as we close the book we cannot help feeling the impression produced by the 'Reminiscences' confirmed—that Carlyle stood, so far as the literature of his time is concerned, entirely alone, in a position of moral and mental isolation very different from that usually sought or coveted by men of letters. He had a very poor opinion of the literature, philosophy, and science of his own day, and expressed for nearly all his contemporaries and rivals profound contempt. England, and in fact the world at large, he regarded as given over to the "mud-gods" and as inhabited by "Dead-Sea apes."

This makes it all the more interesting to know what hope there was to be extracted from the past, what promise held out by the future. But on such points, even in his confidential correspondence, Carlyle is dumb. We must remember that Carlyle's life covers what we are fond of regarding as a splendid literary period. The reign of Victoria has been marked by great achievements in all fields, especially that of literature, science, and speculation. If we took Carlyle's word for it, however, we should suppose it to be a period of besotted ignorance and blind formalism. And yet, as to what might be done for salvation, he has nothing distinct to say.

As a memorial of a literary friendship, the letters are very pleasant reading. Carlyle helped Emerson in England as Emerson helped him in America—though not with such devotion—and the correspondence bears witness to the perfect confidence reposed in each other by the two friends—which is all the more interesting because of the dissimilarity between them that is betrayed at every point. They had really very little in common. Emerson, in the course of his long life, seldom spoke a harsh word of anybody. Carlyle spared no one. Emerson's idealism was of the optimistic kind, and led him to cherish a curious delusion on the subject of a regeneration of the world at the hands of some modern seer or sage, that suggests a habit of mind rather Oriental than Western. Carlyle did not in the least share in this hope, at least in his mature period, for he was so deeply impressed with the depravity of the human race that regeneration through an agency like that of the mild-eyed village Buddhas whom from time to time Emerson sent out with letters of introduction, was to him an idle dream. If Carlyle's "strong man" could have got his hands upon Emerson's "coming man," a sound flogging and a pretty long period of incarceration in the county jail would have been the least punishment allowed him; and Carlyle shows at his best in his effort to pretend to be glad to meet the queer people who were sent over to him from time to time, and he displays, indeed, remarkable reserve in reporting the impression they produced on him.

These volumes, therefore, while they give a more amiable picture of him than the 'Reminiscences,' do not contribute much to the solution of the problem presented by his literary career. Since his death the public has been so much occupied with the details of his private life, his relations with his wife, and the light thrown by them on his character, that his position as a literary man has been neglected. Sooner or later, however, the world will have to decide what sort of a place in literature it is willing to accord to Carlyle as a historian and as an essayist. In this decision his private character will count for as little as that of Gibbon does in our estimate of him. These volumes are quite enough to show that his relation to literature is very peculiar; that he was a literary man who cared little or nothing for literature as such, and a historian who found history mainly what he calls a "dust-hole." With the great literary movement of the nineteenth century he seems to have as little connection as if he had not lived in it. His style was almost a protest against the English language itself. He was regarded during his lifetime as a great teacher, and he gained a great literary reputation from a generation which he despised. Yet it is hard to say what lesson his histories or essays taught that was not known to the world before.

VINCENT'S HAYDN.

Haydn's Dictionary of Dates and Universal Information, relating to All Ages and Nations. Seventeenth Edition, containing the History of the World to the Autumn of 1881. By Benjamin Vincent, Librarian of the Royal Institution of Great Britain; Cor. Mem. Hist. Soc. New York. Revised for American readers. Harper & Bros. 1883.

IN No. 240 of the *Nation* we reviewed the American edition of Haydn's Dictionary published in 1869. That was based on the twelfth English edition, the sixth revised and improved by Mr. Vincent. The compass of the work has since been repeatedly enlarged, and its revision continued. The American editor of the seventeenth edition, now before us, Mr. G. C. Eggleston, while omitting no title, and making "as slight alterations in the text . . . as might be, . . . has corrected errors in the English work with respect to American matters; has added American dates to all important titles from which they were omitted in the English work; and has inserted such additional titles, relating to American subjects, as were necessary to fit the work for the use of American readers." He has thus limited his editorial labor entirely to the American portions, and leaves the responsibility for all the rest to the English editor, whose successive revisions and enlargements have already extended over a quarter of a century.

"Unfortunately, however"—we must here, to our regret, repeat what we said in our review of the issue of 1869—"the defects of the original publication, to be radically removed, required much more than the amount of labor and care which even conscientious revisers are inclined to bestow upon the work of others. And so the Dictionary remains highly imperfect, in spite of continued completing and correcting." And we must still add: "Mr. Vincent's own additions are not always made and revised with the necessary care." That this is a mild expression, rendered with charitable regard for the difficulties of an encyclopædic editor, the following will show: The "Table of Contemporary European Sovereigns," an addition of Mr. Vincent's, fills the first four pages of this again "thoroughly revised" work; with a single exception—an error referring to a King of England—it still contains all the blunders pointed out in our first review: "The accession of Christina of Sweden is dated '1633,' instead of 1632; . . . that of Czar Nicholas '1828,' instead of 1825; that of King William of Prussia '1860,' instead of 1861. Napoleon's second reign, in 1815, is forgotten. Ferdinand I. of Hungary (1526) and Ferdinand I. of Austria (1835) are both entered as Ferdinand II. The Empress Maria Theresa is to be found neither under 'Germany,' nor under 'Hungary,' nor under 'Austria.'" The next page presents the "Population and Governments of the World (according to the Almanach de Gotha)." The first line states the population of Anhalt as it was in December, 1875, and the same is the case with Baden and Bavaria (lines 4 and 5), and all the German States—excepting Oldenburg, which is left as it was in 1871—though the German census of December, 1880, had long been known in "the autumn of 1881." The reason is, the Gotha Almanac for 1882 had not yet made its appearance then, and Mr. Vincent was too negligent to avail himself of other sources of information. The second line introduces as President of the Argentine Confederation Sr. N. Avellaneda, whose going out of office in October, 1880—nearly a year before the date to which the Dictionary is brought down—was recorded in the last Gotha Almanac, but naturally only among the "Additions," which Mr. Vincent overlooked. The third line contains the unofficial statement of the population of the Austrian Empire in 1875, ignoring the official census of 1880. The sixth leaves the population of Belgium also as it was in 1875, although Mr. Vincent could have found the official yearly enumerations of 1876-9 in earlier almanacs.

The process of accretion which has taken place in numerous titles is well exemplified by the first notice in the Dictionary. When Haydn first published it, he concluded his few lines on "Aargau" with the statement that the canton "was much disturbed by religious dissensions in

1841," which was then the latest. Three years later he added: "And the expulsion of the Jesuits was demanded in 1844." Here the notice ends to-day; what became of the demand, or how the expulsion, etc., led to the civil war of the Sunderbund, Mr. Vincent forgot to add. What his "thorough revisions" have amounted to is, however, much better illustrated by such articles as "Assyria" or "Egypt." In the former we easily perceive that he knows of discoveries of Assyrian antiquities by such men as Layard, Rawlinson, George Smith, and Rassam, and even of "classes for the study of the Assyrian language" and of the "Rev. A. H. Sayce's" Assyrian grammar; but that in the light of those discoveries and studies the history and chronology of the article, as it was written and still stands—with its Belus, Ninus, Ninyas, Semiramis, Arius, Aralius, Belochus, and Sarac, and its dates after "the chronologers Blair, Usher, Hales, and Clinton"—are worse than worthless, and that different, monumentally authenticated, names and dates have now to be substituted for the fabulous and fictitious ones, does not seem to have entered his mind. Under "Egypt" we read: "1st epoch, the dynasty of its Pharaohs or 'great Kings,' commenced with Mizraim, the son of Ham, second son of Noah, 2188 B. C.," and then, "Dynasty of Menes (conjectural), B. C. 2717," which carries us back 500 years beyond the "1st epoch." Next follow such fabulous names as Athotes, Busiris, Osymandyas, and Syphoas, with precise dates after the Abbé Lenglet, Blair, and Usher—the Pharaohs of the monuments being omitted, and such Egyptian chronologists as Lepsius, Mariette, or Brugsch ignored. Then we have this ingenious combination: "Rameses III., or Sesostris, reigns . . . 1618," in which the great conqueror of whom the Greeks fabled is identified with an historical King who is generally reckoned to have reigned about 1250 B. C., and the date of the latter arbitrarily altered by several hundred years, in order to suit the chronology of the myths! And not only myths of history are duly dated in this Dictionary, but also events of mythology proper. Thus we learn, under "Greece," that Uranus arrived in that country in 2042 B. C., and, under "Caucasus," that Prometheus was "tied on the top" of that mountain by Jupiter in 1548.

The American editor has done his share of the work better than Mr. Vincent did his. This is, however, not saying much, especially if we consider the disparity of their tasks. Several of the errors and contradictions which we pointed out in the review alluded to above, in regard to the Civil War, have disappeared, without Mr. Eggleston having seen our article—as we can judge from other mistakes left standing. "Antietam Creek," "Battles," "South Mountain," and "United States" still contradict each other as to the events of September 14-18, 1862, in the way we called attention to there. The concurrent dates as to the fighting at Corinth in October, 1862, given under "Battles" and "United States," are still contradicted under the special head. The same is the case in regard to the battle of Perryville in the same month. Similar discrepancies occur as to the surrender of Port Hudson in July, 1863, and the battles at Spottsylvania Court House in May, 1864. The article "United States," if not complete, is very comprehensive, and rather fresh in its latter parts. We wonder, however, why of all the "illustrious" or notorious Americans who have died since 1876, besides President Garfield and his assassin, Mr. Eggleston has selected for mention only General Bragg and Caleb Cushing.

History of the Negro Race in America, from 1619 to 1880. By George W. Williams. G. P. Putnam's Sons. 2 vols. 8vo.

To disparage the product of great literary industry is always repugnant to the fair-minded critic. In the present case, his desire to bestow praise is heightened by the fact that the author is one of the race whose history he has undertaken to relate. Mr. Williams is justly entitled to the credit of having produced the most ambitious and elaborate work that has yet emanated from his colored countrymen, as is obvious from his list of such works. Moreover, his two volumes are, externally and typographically, very inviting, not to say imposing.

Nevertheless, the critic has a duty to perform, to the author and to the public, and cannot avoid assigning this history a rank far below its pretensions. He would be glad to say it was readable, but he has not found it so; or a valuable book of reference, but it is not that; or intellectually remarkable, but, by the only standard of comparison which Mr. Williams would exact, it must be judged the crude performance of a mind in no way exceptionally endowed. Its total effect is that of cramming, without the power to digest or arrange. Such a statement will surprise the author, as it probably will some of his reviewers, who have commended the orderliness of his narrative, whereas the fact is that his division and distribution of topics is unmethodical to the last degree. It is easy, in this matter, to be deceived by appearances, especially if one only looks at the table of contents. The moment one goes below the chapter headings, the defects of time, perspective, and generalization become painfully manifest. Wherever the divisions are not marked out by nature, as when dealing with slavery in the colonies, they are for the most part inapt, illogical, often grotesque. For an example of classification run mad, the chapter in the second volume on "Anti-slavery Methods" may be consulted.

Mr. Williams has chosen to begin with the Flood; but a Biblical argument (vol. i., pp. 1–11) to prove the negro a man, seems, in these Darwinian days, more than antediluvian. In the theological seminary from which the author was graduated this may be thought a necessary clearing of the ground; and there, too—but where else, unless perhaps in Mr. Hubert Bancroft's literary laboratory?—the following sentence, introducing a chapter on "Primitive Negro Civilization," may be read without a smile: "It is fair to presume that God gave all the races of mankind civilization to start with. We infer this from the known character of the Creator" (vol. i., p. 22). The next step is to paint the character of the Africans of the West coast, the principal ancestors of the colored Americans. This might have been made attractive reading, but in truth it is an indiscriminate hodgepodge, and is oddly succeeded by accounts of the colonies of Sierra Leone and Liberia—in the case of the latter, both inadequate and misleading. But now the wild Africans are to be got to America, and a chapter on the slave-trade, one would think, would be in order. It will hardly be believed that there is no such chapter, nor anywhere a description of the horrors of that traffic. The allusions to it are purely incidental under the colonies, and ignore it on the high seas, in the "middle passage."

The author owes his higher education to a Massachusetts institution, and that State notoriously had a preëminent share in emancipating his race, both in her own borders and in the nation at large. It is therefore somewhat shocking to find him arraigning her as conspicuously sinful in her colonial slaveholding, and heaping upon her epithets which no one of her sister colonies provokes. The reason of this extraordinary assault is the author's subjection to the influence of Mr. George H. Moore, whose well-known 'Notes on the History of Slavery in Massachusetts' furnished a handy source of information for this colony. Mr. Moore's work, though historically valuable, is devoid of the historic spirit, and is an unfair and thinly-veiled political pamphlet. That Mr. Williams should have borrowed not only its facts but its animus, is much to be regretted.

The rise and development of the anti-slavery movement in this country is miserably presented in these pages; indeed, it is not too harsh to say that the author has made a perfect mess of it. The true character of the Colonization Society is slurred over, and its stormy and malignant contention with the abolitionists is summed up in these gentle lines: "The Colonization Society was never able to secure the sympathy of the various anti-slavery societies of the country, and was unable to gain the confidence of the colored people to any great extent" (vol. ii., p. 53). In the chapter on the "Anti-Slavery Efforts of Free Negroes," the early protests of James Forten and other Philadelphians against the Colonization Society should have found a place; and here should have been introduced the least-known and most interesting figure in the annals of colored Americans, David Walker. The author of the 'Appeal, in four articles, together with a Preamble, to the Colored Citizens of the World, but in particular, and very expressly, to those of the United States of America, written in Boston, in the State of Massachusetts, Sept. 28, 1829,' will one day be rated at his true worth. His thrilling tract, which Southern legislatures tremblingly considered with closed doors, though issued from a second-hand clothing shop in the Puritan capital, is now one of the rarest of anti-slavery documents. Mr. Williams, who gives in full Chief-Justice Sewall's 'The Selling of Joseph,' might well have reprinted the third edition of the 'Appeal' verbatim, gaining space, if necessary, by sacrificing the first 114 pages of his first volume. But Walker is not introduced chronologically, and just escapes virtual non-recognition by being remembered in the appendix to the second volume. His name is even omitted from the index.

The political opposition to slavery is not correctly set forth in its origin and development. James G. Birney is recorded, in one of the author's absurd subdivisions, as a member of the "heterodox anti-slavery party"—a nonentity; but not a word is said of his connection with the Liberty party, nor is the existence of such a party remotely hinted at. There is no chapter or section on the Fugitive-Slave Law, which is dismissed in the four lines: "Another fugitive-slave law was demanded by the South, and the Northern members voted them the right to hunt slaves on free soil. The law passed, and was approved on the 18th of September, 1850" (vol. ii., p. 107). One looks in vain in the text or in the index for any account of the cases, arising under this law, which stirred the moral sentiment of the North to its depths. The poor victims whose names became famous in both hemispheres, and will yet be commemorated in a proper history of their color, are passed over in favor of successful tradesmen and mechanics. The representative men of color, by the way, do not form a chapter by themselves, but are distributed in at least three places, with flagrant disproportion and omissions. The Kansas struggle is chronicled very indifferently under the fanciful title, "Northern Sympathy and Southern Subterfuge"!—subterfuge not being precisely what John Brown had to fight. Chapters xviii. and xix., vol. ii., on the "Negroes as Soldiers," are among the best and most useful in the book. The summary of reconstruction is worthless, and

is not excused by Mr. Williams's announcement that he is preparing a two-volume history of this dismal period. Still, his conclusion is just: "Neither the South nor the Government could say: 'Thou canst not say I did it: shake not thy gory locks at me.' Both were culpable, and both have suffered the pangs of remorse."

We miss a chapter on color prejudice, graphically describing the condition and estimation of the free blacks at the North at the opening of the anti-slavery agitation. It would have pointed a good many morals, one being that Mr. Williams's book and military and political career disprove the then all but universal belief that the free negro could never be anything but a despised and degraded object so long as he remained in this country; the other being that the range of employment and social recognition of the race have been very little extended since emancipation. We ought also to have expected that the supreme faculty of the negro for music would have engaged Mr. Williams's attention, and insured a chapter on the negro melodies originating on the plantation and of late years carried by "Jubilee Singers" all over the world. "Uncle Remus" and his folk-lore should have furnished another. We might, further, have been shown the probable derivation of music and fable from the West African tribes. But Mr. Williams preferred rather to dwell on their utterly degraded natures.

To conclude, we cannot commend this work for originality, ability, or entire accuracy. As a book of reference, it will infallibly disappoint. After the parade of the number of books consulted in the preparation of it, the authorities cited are singularly few, and are indicated as a rule in the vaguest manner. A certain amount of historical, biographical, and statistical information is conveniently brought together, but it will have to be used with caution.

Les Chemins de Fer en Amérique. Par E. Lavoinne, Ingénieur-en-Chef des Ponts et Chaussées, et E. Pontzen, Ingénieur, Ancien Élève de l'École des Ponts et Chaussées. Tome Second. Exploitation, et Chemins de fer à voie étroite et Tramways. Paris: Dunod.

THIS is the second volume of an important work, of which the first was published two years ago. It is the outgrowth of investigations begun by Messrs. Lavoinne and Pontzen in 1876, when they both held important positions in connection with the Centennial Exhibition. The first volume related to construction, and was illustrated by an atlas containing thirty-nine large plates, constituting the most complete collection of information as to the details of American railway construction that has ever been brought together, and, incidentally, calling attention to peculiarities of American work which, while so familiar to our own engineers as to escape attention, strike foreigners as noteworthy.

The volume now before us (659 large octavo pages, including a complete index and an atlas of thirty-eight plates) is devoted to the *maintenance* and *administration* of American railways, including a description of our system of tramways and narrow-gauge railways. It would be as just as it would be commonplace to say that this book should be found in the library of every engineer, and should especially become the vade-mecum of the engineering student. It is really something more than this expression would imply. Its authors have apparently exhausted every means of information, and, so far as we can judge from a casual examination, they have left no detail unnoticed, from the first locating of the line to the final construction of the most complete Pullman car. From the information herein contained, an engineer who had never seen a railway could construct and equip it completely in the best manner, his decision between alternative methods being aided by sound advice. Having built his road, he would find in the volume before us a careful consideration of methods of administration; surveillance and maintenance of the roadway; motive power; management of trains; character of freight traffic; tariffs for freight and passengers; relations with connecting roads, etc., etc. Eighty-five pages are given to the legal status and financial management of railway companies, etc. No such complete popular publication has ever been made concerning the railway system of any country before, and it may well be doubted whether there will be again. We are glad to know that there is a prospect of the publication of this work in English; but, with its ample illustrations, it cannot fail to be of value in its present form, even to engineers who have no knowledge of the French language.

Selections from Lucian, with Introductions and Notes, by Charles Richard Williams, Professor of Greek in Lake Forest University, Ill. Boston: John Allyn.

THIS book is evidently the result of much patient and long-continued labor. Of its typography and general make-up, it is only necessary to say that it is from the "University Press" of John Wilson & Son, Cambridge. The "General Introduction" of forty-one pages treats of the life, times, and works of Lucian. Many parts of this introduction are extremely well done, but sometimes the style is inflated to a degree bordering on the sophomoric. The Greek text of twenty-two pieces of Lucian occupies 152 pages, the "Special Introductions and Notes" 145 more. While these introductions are, on the whole, very useful, they are too diffuse and rhetorical, and by their frequent repetition of the same ideas in slightly varied forms, they become monotonous. Take the following examples: In the introduction to the second piece, "Charon," Prof. Williams says:

> "In no one of Lucian's writings are the charms of his style, his keen satire, his biting sarcasm . . . seen to better advantage."

Turning to the introduction to the next piece, "Timon," we read:

> "This dialogue is usually considered Lucian's masterpiece. . . . In spirited character-sketching, in keenness of satire, . . . Lucian is throughout at his best."

In the introduction to the next piece, "The Cock," we are told:

> "The perfect ease and gracefulness of this dialogue mark it as the probable work of Lucian's best period, when his style had reached its highest maturity."

And so on. This continuous laudation becomes somewhat tedious. Indeed, the book would be improved by considerable "cutting" and condensation. Such a process would have furnished space for another improvement. Taking the first paragraph of the text of Lucian as given by Prof. Williams, comprising thirty-three lines, or one page and three lines, we have three and a half pages of "Notes." In the course of these notes we have, in addition to a few passages quoted, references to the following authors and works, unaccompanied by the text of the passages; and in order to comply with the direction to compare them, it would be necessary to have the books at hand: Xenophon ('Anabasis,' 'Memorabilia,' 'Symposium,' 'Œconomics'), Demosthenes ('De Corona,' 'Philippics,' 'Olynthiacs'), Plato ('Apology'), Aristotle ('Politics'), Alciphron, and four dialogues of Lucian not contained in the 'Selections.' To some of these works there is more than reference. Had Prof. Williams cut out some of his "eloquence," and quoted more of his illustrative passages, he would have made his book more convenient and useful. Notwithstanding these and some other defects, this is the best edition of a selection from Lucian for school purposes with which we are acquainted. Were we going to read Lucian with a class, we should adopt it without hesitation.

On the Wing. By Mary E. Blake. Boston: Lee & Shepard. 1883. 16mo, pp. 231.

THE author of this book was one of an "excursion party" to California, and the volume is made up of a series of bright and chatty letters to a Boston paper. That there is absolutely nothing new in this correspondence is not, perhaps, important from the standpoint of journalism, so long as it is readable; but this consideration makes its permanent setting in book form of more than doubtful necessity. The descriptions are accurate, and the facts authentic, but the suspicion is excited that the writer has not before been west of Watertown. There is a smack of the Bostonian who believed there were not more than twenty men in that city who could have written the plays of Shakspere. The author has a little start of surprise when she finds that there are pretty girls in Chicago like those on Washington Street, and that they talk about "blocks," in describing distances, "just as they do in New York." She is overcome by her own daring when she discovers that she has "really seen day dawn over the plains of Kansas." She is astonished to find "young people refined and well-bred" in San Francisco, but recovers her equipoise on the tender of a locomotive, where "my companion was a slim, young Bostonian who could lead a german or give you the Otello fantaisie of Ernst one night, and climb Mont Blanc next morning; so I felt perfectly at home." It is to be hoped that excursion parties will continue to travel over well-worn routes, but the suggestion may be pardoned that the literature of such trips is already measurably complete.

Study and Stimulants. By A. A. Reade. Philadelphia: J. B. Lippincott & Co.

ALTHOUGH in full sympathy with the opinions which 'Study and Stimulants' is published to confirm, we think the book itself more curious than valuable. It consists of more than a hundred "testimonies," as they are called, some very curt and some prolix, upon the mental influence of stimulants, given by brain-workers in reply to specific inquiries, and nearly a score more extracted from publications, with twenty pages of comment. The editor concludes that alcohol and tobacco are of no value to a healthy brain, that the most severe mental work can be satisfactorily done without artificial stimulus, and that the influence of alcohol in health is bad. All this is probably true, and the drift of the evidence given here is certainly in that direction. But the book lacks completeness. It leaves the questions asked to be inferred from the answers, and one cannot tell whether all the respondents were addressed identically, and, particularly, what others failed to reply. Without knowing how the nays stand, it is not well to say the ayes have it. And if it is a matter of votes or of influence, a hundred and twenty is a small number of the students of the world to decide such a question. One can readily understand that those who do use alcohol freely in connection with literary labor, if there are such, might resent being catechized as an impertinence, or at least decline to lay open to public gaze their mental machinery if it is driven by a spirit-lamp rather than water-power. We must have

a count of the absentees before siding with this majority because it is a majority.

Some of the contributors make such very odd statements that they excite wonder, if not a smile. For instance, Mr. Matthew Arnold says: "Real brain-work by itself, I think, upsets the worker and makes him bilious." Mr. Francillon "always insists very strongly upon brain-work—beyond an uncertain point—being non-natural." Mr. Robert Buchanan announces: "The cases of dire disease generated by total abstinence from liquor are much more terrible than those caused by excess." A collection of the opinions of larger consumers might be a curious commentary on the views of the more abstemious.

BOOKS OF THE WEEK.

Alexander, Mrs. The Admiral's Ward: a Novel. Henry Holt & Co. $1.
Baldwin, Prof. J. Introduction to the Study of English Literature and Literary Criticism. Part 2. Prose. Philadelphia: John E. Potter & Co.
Berg, A. E. The Universal Self-Instructor and Manual of General Reference. Thomas Kelly.

Fine Arts.

THE SIXTH ANNUAL EXHIBITION OF THE SOCIETY OF AMERICAN ARTISTS.

THESE periodical exhibitions now bear a very close resemblance one to another. But this fact in itself should not be regarded as unfavorable if the signs were in other respects hopeful, for progress in art is rarely marked by striking changes or novel departures from the general course of feeling and the customary lines of effort at any given time, unless it be a time when feeble and false principles and practice prevail. In growing schools, progress is marked rather by steady adherence to the prevailing aims, and by tranquil endeavor to excel in the directions in which all are striving. This unity of purpose, which is wholly compatible with full expression of individual genius, is what largely constitutes the life of a school; and, through the support which mutual sympathy and friendly criticism give, individuals attain degrees of excellence which would otherwise be impossible to them.

So far as unity of purpose and mutual sympathy go, the conditions under which the Society of American Artists is now working are favorable to progress. There evidently exists, in this Society, an *esprit de corps* which is very powerful. If there is anything unfavorable in the conditions, it is that the fundamental principles which actuate the artists are inadequate—that the models which they have taken for inspiration and guidance are not of sufficiently excellent character. The quality of the work displayed indicates that this is largely the case, and it is on this account that the unity of purpose, so admirably maintained, fails to accomplish what it ought. The similarity which we notice between one of these exhibitions and another is, therefore, to a great extent one of mannerism rather than of quiet and steady progress in which the successive steps are hardly noticed. The new departure of adopting modern Continental aims and methods, which was taken, almost unanimously, a few years ago, by our younger artists, was interesting and attractive at first; and from it, as we have before said, some important gain was made over the more feeble traditional characteristics of the older American art. But it is now very noticeable that the inspiration is waning. The novelty of French principles is wearing off; and it must be apparent to the discerning that progress on these lines is no longer marked. The range of qualities exemplified by Continental art has been practically exhausted; our American students have very fairly mastered them, and their limited and misleading character is shown by the comparatively stationary, if not in some respects retrograde, condition which these exhibitions more and more clearly manifest.

We would again, as we have done before, express the hope that the day is not far distant when our young artists will devote themselves to the study of the entirely sound and all-embracing principles of the central Italian schools of art, and will, under the instruction therefrom received, apply themselves with renewed energy to the interpretation of nature from the diverse and enlarged modern points of view. But there are always some signs of progress which keep up our faith in the ultimate triumph of American art, and to these we shall endeavor to do justice. Among the pictures in the present display which seem to us most worthy of notice, is "A Prelude," No. 36, by T. W. Dewing. This picture is conspicuous by real merits no less than by position and singularity. It belongs to that class of fanciful æsthetic designs which are growing daily more common, but it is far above the average of such works. It represents two maidens, clad in loose and simple gowns—of delicate cinnamon and rosy-lilac colors respectively—seated upon low chairs of antique pattern, with harps by their sides. They are relieved against a background of pale growing roses, which are reflected upon the polished surface of the marble floor, so that the entire background, from top to bottom of the canvas, is one delicately varied field of rose color. As a work of color the picture possesses a great deal of beauty. But it is not so beautiful in its lines and masses. The figure to the left is too square-shouldered for good form, and the hand of the falling arm is ill-shaped, while both figures and drapery suggest ordinary studies from models rather than fine designing faculty. A comparison of Stothard's vignettes to Rogers's "Poems," which are the best instances of graceful design in a similar vein that we know of, will illustrate our meaning. But notwithstanding all defects, there remains much to be praised in this work. There is some exquisite painting in it, especially so in the head of the figure to the right, where the flesh tones are delightfully pure and varied, and the hair and its pearl ornaments are touched in with very subtle feeling. This is a direction, however, in which we think that modern art cannot safely go very far. It strikes a vein of rather unwholesome sentimentality. Modern life and modes of thought are so far opposed to the ideal feeling toward which this design leans, that a man can hardly possess it in a thoroughly healthy condition. As a rule, the safer course, even for artists like Mr. Dewing, will be, in our judgment, to deal with the beauty of the actual. Mr. Dewing's powers are such that if he would apply his whole strength to subjects of real life, he might, we think, easily lead among our figure painters.

Very different is "The Short-Cut, Watchung Station, N. J.," No. 69, by George Inness. It is a simple passage of familiar landscape. Broad extent of level meadow, narrow deep-cut brooklet in retiring perspective, rustic bridge, distant belt of woodland, with scant foliage of spring or autumn, middle-ground and distance in light, foreground in unbroken cloud-shadow, figure of an old man in shade on the bridge, other figures in light beyond, in graduated magnitudes as they retire, distant train of cars carrying off the colors of the figures, and connecting them with those of buildings still further removed, arid gray sky with upper blue openings—such are the elements of the design. The chiaroscuro is broad and true, the relation of light to shadow being especially fine. One feels that the local colors of the shaded parts are really the same as those of the parts in light, and that, as soon as the cloud passes, they will appear the same. This absolute justness of color relation in lights and shades is rarely so admirably reached. There is no instance in this picture of that forcing of shades which we sometimes find in works by Mr. Inness. The whole subject is here rendered in pure and delicate middle-tint, which is set off by just enough emphatic light and dark. The only thing that we notice to criticise is the too strong local color in the distant figures, which slightly disturbs the general harmony and quiet. More complete characterization of details would increase the beauty and value of the picture; but this is something that Mr. Inness seems resolved never to give. On this account we never feel wholly satisfied with his painting, though it often possesses qualities, such as those just noticed, which we highly appreciate.

No. 56, "Nydia," is another of Mr. George Fuller's vagaries. This, like all the rest of this artist's work, shows enough latent capacity to justify us in blaming him severely for never painting truthfully or beautifully. The effect here presented is not that of either night or day—

it is an impossible one under any imaginable conditions. The handling is without meaning, and the form appears to be dissolving away. In color it is foul and false throughout. "The Fisherman's Daughter," No. 73, by Frank C. Jones, is a piece of good, though commonplace, painting, free alike from marked faults and important qualities. In comparison with so much that is bizarre and ungrammatical in the gallery it is grateful and instructive. Mr. R. Swain Gifford's "Evening in Autumn," No. 58, is effective but artificial. It lacks the variety and freshness of nature. Hot browns and yellowish greens prevail too far. More influence of gray from the sky would render it at once more truthful and more agreeable. Little can be said in praise of No. 7, "Summer," by J. Carroll Beckwith. It is not fine in total scheme of color, nor is it good in execution. The gray of the ladies' dress is unfeelingly and unnaturally uniform and inharmonious with its surroundings. The lips are far too untempered in crimson color, and the scarlet flowers of the background are obtrusive in violent local hue. The greens of the background, too, are crude and unvaried, and the handling is throughout monotonous and heavy. Mr. R. B. Brandegee's "Portrait," No. 11, is clever and frank work, though it is both conventional and forced in the shadows. Mr. J. Foxcroft Cole's "Cloudy Day, New England," No. 27, is good painting of the obvious qualities of a pleasant passage of landscape under gray sky. "Afternoon," by Kenyon Cox, No. 28, is an unaffected bit of quiet (apparently French) landscape in the sketchy French style. No. 23, "Studio Interior," by William M. Chase, is a piece of showy, rather than good, painting. The subject has no unity, being the scattered paraphernalia of a modern studio—mere *roba;* and Mr. Chase has failed to bring out the interest which might be found in even so bad a subject were its chiaroscuro faithfully studied. Instead of doing this he has obtruded, with glaring emphasis, the sheen of the lady's satin gown and the silk hangings, and the glints of light on objects of ordinary bric-à-brac. "Hackensack Landscape," No. 24, by the same artist, has some conspicuously bad drawing, especially in the perspective curve of the river-bank to the left. Mr. Chase seems to cultivate a bad method of handling—a method that does not vary expressively in the rendering of objects of different kinds. His trees, grass, sky, and water are all done in the same way. Mr. Walter L. Palmer's "Noon," No. 89, has good color and light, and shows a fine sense of space. The subject is very simple, but it is graceful, and without any discord of ugly object.

There are strong qualities along with much bad taste in Mr. Sargent's "Portrait of a Lady," No. 103. The strong qualities are those of drawing and color values. The bad taste is displayed in the ungraceful pose and the ugly costume, which sadly deforms the figure. We have no doubt the picture is truthful in these points; but it is a pity that an artist should devote so much skill to giving enduring form to the monstrosities of a fashionable Parisian costume. The fashion in which the lady's hair is arranged is also very ungraceful and unfit for a painter. An orderly and becoming mode of wearing the hair is especially desirable for a lady when she is going to sit for her portrait. If Mr. J. H. Twachtman's "Silver Poplars," No. 128, possesses any good qualities they entirely pass our understanding. The picture, if it can be called one, consists of a mostly flat space of dull green paint, with some dirty gray ramified brush lines drawn through it, and a space of ungraduated leaden gray above for a sky. It is a mistake to suppose that there are any true artistic qualities in work of this kind. It is no more artistic than it is like nature. We hope our artists will soon cease to throw away their time and materials on such vagaries. Mr. H. P. Smith's "Twilight—Mid-Ocean," No. 113, though showing strongly the mannerism that we spoke of in regard to this artist's work in the last Water-Color Exhibition, is very expressive of the beauty and power of the limitless sea. No. 46, "A Dead Quince Tree," by Joe Evans, looks like a conscientious study. It is inexperienced work, however, and shows the want of due appreciation of those elements which make a subject of this kind worth painting. The tree lacks expression of that united impulse in its leading lines which is expressive of life and beauty, and which remains a prominent characteristic after the tree is dead. Some trees show it more plainly than others; but in choosing one to paint, those which fail to show it in a marked manner should be rejected. Even in a good model an artist will usually find it necessary to emphasize somewhat the expression of this trait. The rigid fence, too, which runs across the canvas, is uninteresting, and harmful to the design. An example of good, quiet, grammatical painting is Mr. Thomas Allen's "Woodland Pasture in Early Autumn," No. 3.

"Le Philtre," No. 133, by H. O. Walker, is a nude female figure, ugly in form, ungraceful in pose, and certainly not fine in color. We see no good reason why it should have been painted. Mr. C. Y. Turner's "Portrait," No. 127, is a very good free piece of work, though it is somewhat too violent in contrasts of light and shade. By these strong contrasts, as we have before shown, color is in great measure lost in the shadows. Fine colorists, like the Venetian masters, therefore avoid them, keeping their shadows always sufficiently luminous to insure the fullest preservation of local hues that is compatible with the legitimate modifications of shade. This most important principle of good coloring has been strangely lost sight of in the modern schools, but it is invariably enforced by the teaching of the central Italian schools, to which we have referred as illustrating all that is exemplary in regard to fundamental principles. This principle is enforced, too, by the example of those modern painters who have founded their practice upon these Italian schools—painters like Reynolds, Gainsborough, and Turner. Another very good portrait sketch is that of Mr. Montague Flagg, No. 50. These works contain so much that is good that we cannot help wishing that their authors would, for a while, at least, follow the example of Bellini and Titian, rather than that of the present schools of Munich and Paris, and give us beautifully colored and quietly finished, no less than expressive and spirited work. But we can pardon the want of finish and accept mere sketches in place of finished pictures, if only the sketches be executed on thoroughly true principles, and be right and beautiful as far as they go. It is the want of right cultivation in fundamental principles—whether for rapid sketching or finished painting—that we have so constantly to complain of; not the mere fact that our artists just now prefer to work sketchily.

There are good qualities in the large canvas No. 38, "La Marcelline," by Mr. Donoho, but it is painfully monotonous in color and scattered in effect. To represent adequately and agreeably the infinity of dead leaves which cover the ground in autumn of such a wood interior, is a very difficult task. The difficulty would have been lessened, however, and the result have been much better, in this case, if the artist had looked faithfully enough at nature. He would then have seen that the fallen leaves in a wood rarely, if ever, present such an appearance of absolutely speckled equality to the ground-surface as is here represented. The natural unevenness of the ground, the accidents of winds, and the unequal spacing and magnitudes of the trees, tend to gather the leaves in greater heaps in some places than in others, and thus is produced a variety and a gathering of details into masses which make the scene more grateful to the eye, and consequently more suitable for a picture, than when no such variety or gathering into masses exists. No. 32, "Après la Messe," by William F. Dannat, is a piece of utterly vulgar realism. The subject is a debasing one to contemplate, and the execution exhibits nothing more than the commonest artistic powers. Mr. E. H. Blashfield's "The Minute Men," No. 8, is below the mark of other works which we have noticed by him. The conception, composition, and treatment of the subject are thoroughly commonplace.

The few examples of sculpture which accompany this exhibition are of little importance. The art of sculpture is in a far from prosperous condition at the present time. However the prevailing methods of conception and treatment may do in painting, they certainly are not favorable to sculpture. All merely picturesque and realistic motives are outside the range of the proper ends of sculpture, which requires for its life the refined study of beautiful form. In addition to the unfavorable influence of the modern picturesque methods upon sculpture, another great cause for its present low condition is, we suspect, the modern practice of modelling in clay—a material which very naturally lends itself to picturesque treatment, such as the French modellers exemplify. Indeed, we have, as a rule, only modellers in clay at the present time. There are, probably, few original sculptors living who could successfully carve a statue in marble; but it is through the actual use of the chisel, among other things, that we must hope to regain something of the true sculptor's sense of what form in marble should properly be.

Henry Holt & Co.'s

Leisure Moment Series.

READY SATURDAY, APRIL 14:

No. 5. A CHELSEA HOUSEHOLDER. 30 cents.

No. 4. A STORY OF CARNIVAL. By M. A. M. Hoppus. 25 cents.

No. 3. MRS. ALEXANDER'S THE ADMIRAL'S WARD. 40 cents.

No. 2. GIDEON FLEYCE. By H. W. Lucy. 30 cents.

No. 1. DEMOCRACY. An American Novel. 30 cents.

☞ The above are also published in the LEISURE HOUR SERIES, price $1 each.

The Nation.

NEW YORK, THURSDAY, APRIL 19, 1883.

The Week.

THE removal of Mr. Trowbridge, the Michigan Collector, in the middle of his term, without any charge against him, in spite of long and confessedly faithful service, on the demand of Senator Conger, in order that a newspaper henchman of his might get the vacant place, has excited a great deal of comment all over the country as well as in Michigan. It has attracted all the more attention because it has occurred in the State which sent forth Jay Hubbell last fall to collect "voluntary assessments of two per cent. on your annual compensation," but subsequently expressed its opinion of that sort of thing by ousting six of its nine Republican Congressmen. In fact, there is no doubt that the Michigan Republicans are deeply imbued with the civil-service reform doctrines of President Arthur's first Message, and that therefore it is one of the worst States at the North to select for the exhibition of fresh examples of the working of the spoils system. There has, however, in most of the criticisms of this last performance, been too much disposition to lay the blame of it on Senator Conger. It is talked of as if it were all, or even mainly, his doing. But the truth is that he has done nothing at all but ask a favor. He has no power either of appointment or dismissal. He is not responsible under the Constitution for the retention or dismissal of any officer of the Government. He had no power over Collector Trowbridge. He probably bore him no grudge. He simply wanted a place with a salary for one of his followers, and asked for it. He of course ought not to have done this, but there really would have been no great harm in it if the President had met it in the proper manner, just as there would have been no great harm in asking the President to give the henchman $2,500 or so out of his own pocket. Such a request would have injured no one. The President would simply have said that he had better uses for his money than giving it to strolling henchmen, and Mr. Conger would have said: "All right; no harm done," and there the affair would have ended.

It is all the more necessary to keep this in mind because the President, as well as others, is probably deceived as to the real nature of such transactions by the part the Senator plays in them. He thinks, apparently, that the intervention of a Senator relieves him of some of his responsibility. Under the old spoils system it did. Under the new system, initiated by his own message and the passage of the Civil-Service Reform Bill, all this rubbish has been cleared away. The President's responsibility is fully restored, in the eyes of the public at least. The voters now expect him not only to execute the new law as regards the offices which it covers, but also to apply its principles to the offices which it does not cover. He has said in his message, in the most solemn manner, that the tenure of all subordinate offices should be stable, and that no officer should be removed without cause during his term. When he said this he knew, and everybody knew, that he had the power to carry it out, and that what Senator Conger or any other Senator said about it made no difference whatever. Moreover, there is no use any longer in trying to persuade the people that performances of this sort "strengthen" the President. This old cant phrase has likewise been exploded. There is in the United States only one source of strength for an elected officer, and that is the polls. There has, in truth, never been any other; but part of the humbug of the spoils system consisted in persuading party newspaper editors that, by plenty of "rotation in office," a President was made powerful and sure of reëlection; and they accordingly used to preach this diligently, though every election falsified it. The strong man in our politics is the man who can get most votes, and no administrative officer nowadays can get most votes of whose manner of administering his office the majority does not approve.

The Michigan newspapers state that at a recent Detroit reception to Governor Begole, he was conducted to a "chair that rested upon a dais six or eight inches above the floor. The chair was shielded by a canopy of state, and was an exact reproduction of the chair of state used by Louis XIII." And this is the same Governor who, only a few short weeks ago, objected to being called "Governor," and insisted that he was really only "principal servant" of the people.

Bradstreet's Journal anticipates extensive "reprisals" against Germany, in the shape of retaliatory legislation when Congress reassembles, the occasion for such legislation being the German decree prohibiting the importation of American pork upon grounds of unhealthfulness. The articles most likely to be prohibited in the way of retaliation are said to be German wines, hosiery, and woollen goods, there being considerable evidence obtainable showing that these things are extensively adulterated with poisonous coloring matter. We ought to be very slow in contributing ourselves to the laughing-stock of nations merely because Germany has done a foolish thing. She has limited, in some small degree, her own market for the purchase of food. She has raised the price upon herself, but she has not sensibly curtailed our market for the sale of pork. The same number of mouths remain to be filled, and filled they will be to the extent of Germany's purchasing power, whether they obtain a part of their supply from us directly or through English, French, or Dutch channels. Germany has never been a large customer for our pork products, except for the article of lard, which does not seem to be embraced in the decree of prohibition. So it appears we do not suffer very seriously from the measures of the German Government. But a policy of retaliation might indeed have the good effect of exposing the absurdity of the whole system.

The effects of the new pension law, which grants an increase in the rate of pensions from $24 to $30 per month to those Union soldiers who lost a leg above the knee or an arm above the elbow, begin already to be felt in the Pension Office, more than 32,000 papers in the nature of evidence, 52,000 reports, and 46,000 letters having been received last month. One would think that nothing could be easier than to prevent fraud when the application of the law seems to be naturally guided by ocular observation. But the ingenuity of the pension swindler has thus far baffled all calculation as to the depth of its resources, and unless the agents of the Pension Office are uncommonly vigilant, the pension rolls will soon contain thousands of names whose owners had never suspected themselves before of having lost an arm just above the elbow, or a leg just above the knee. Fraud on a large scale can be prevented only by having pension claims adjudicated as much as possible on personal inspection of the claimants, and as little as possible on the strength of mere affidavits. This may cost some money, but it will prevent the expenditure of much more money in the end.

Except the pending change in iron-workers' wages, which causes some apprehension of strikes, there is scarcely a feature of the general industrial and mercantile situation that is unfavorable. The prospect for crops of every kind throughout the West, notwithstanding the reports of some damage to the winter wheat, is as good as it ever was at this season of the year, while it is certain that the crops of all Western Europe will be from fifteen to twenty-five per cent. short of the average, thus insuring a good foreign market for our surplus. The money market is more easy. On Saturday the bank statement showed an increase of more than $4,200,000 and a decrease of loans, which enabled the banks to offer at least $4,000,000 to $5,000,000 more money on loan. In Europe there is an unusually large amount of speculative capital disposed to seek investment in American securities, particularly railroad bonds. Two or three large new loans for American railroads have been brought out in London in the past fortnight. Increased interest in the stock market has also been manifest in the last week. For several weeks up to last Saturday there had been a pretty continuous buying of the best dividend-paying stocks, which had advanced in that time from 8 to 15 per cent., the most rapid advance, however, being last week, when the profit became so large that a great many holders proceeded to realize them. This caused a sudden break of from 1 to 4 per cent. on Monday, but there was an almost complete recovery on Tuesday.

Mr. Joseph Cook, of Boston, who also calls himself "The Boston Monday Lectureship," has been discoursing on the shortcom-

ings of the American press in one of those performances, which he calls his "preludes," which consist in some random observations made prior to the regular lecture. He describes himself as much troubled not only by the deficiencies of the press, but by the low opinion entertained of it by foreign critics. One of his favorite modes of paying off his enemies is to bring home from his travels unpleasant accounts of what he heard foreigners say about them. Mr. Cook's reports of what he has seen and heard, either abroad or anywhere, are always to be received with caution; but even if he has heard all he says he has heard in the way of "merciless sneers," he ought to be the last person to reproduce it. There is probably no person professing to be educated who has brought so much discredit on the American mind within the last seven years as Mr. Joseph Cook himself, in the eyes of those foreigners whose opinions about newspapers or any kind of literature are worth reporting. His gross ignorance and inaccuracy on those matters of science with which he has undertaken to deal, have again and again been exposed by scientific men. So have his reports of the opinions of foreign philosophers and thinkers. There is, however, nothing discreditable to the country in the existence of a conspicuous blunderer of this kind. What does damage it is the triumph of Mr. Cook's remarkable talents as a sensational preacher over all attempts to make his real character known to his audiences. His hall is just as full, we believe, as it was before he was found out, and there is no apparent diminution in the number of those who think he has reconciled religion and science. The better educated and more rational clergymen are as much ashamed of his performances as anybody, but a lamentably large number of them are glad to accept his assistance in keeping alive a spirit of credulous wonder which they, mistakenly we are sure, consider in some manner favorable to the growth and maintenance of genuine religious feeling.

One of the most remarkable suits ever tried has just come to an end in Boston. It was brought by Lizzie Gannon, a child of tender years, against Father Fleming, who was called in as her spiritual adviser. The child had two paper dolls, or "angels," to which she attributed a certain supernatural virtue or potency. He took the angels away from her, and she immediately began to suffer in health to such a degree that she brought a suit against Father Fleming for $5,000, a sum which any fair-minded person will admit is a low estimate of the damage caused by the loss of the society of angels, even in a community where the average social standard is as high as in Boston. The Judge, however, we are sorry to say, charged heavily against the plaintiff, reminding the jury that "the universe is governed by law," and that "the smallest speck which floats in the sunbeam and the largest planet which lies upon the bounds of telescopic vision are subject alike to the same universal law of gravitation, and we are not to place any faith in the mysterious delusions of spiritualism." Under these instructions the jury returned a verdict of one cent damages, which only carries half the costs, so that Lizzie has not only lost her angels, but has a heavy bill to pay. At the same time, the verdict seems to establish her right to the possession of her angels, and exemption from all interference with them by Father Fleming or anybody else. The mental training of Lizzie is evidently going to be surrounded with many difficulties.

Mr. Curtis, who made the only strictly literary speech at the Holmes dinner on the 12th instant, hinted at a parallel between Irving and the guest of the evening which was, perhaps, rather calculated to suggest differences than a resemblance. The likeness really ends with the fact that one in New England and the other in New York first revealed the hitherto unsuspected opportunities for the development of a humorous literature. But their humor was very different. Irving found his materials ready in the provincial traditions of phlegmatic Dutch colonists; but the colonial traditions of New England, when Dr. Holmes began to write, were altogether too sacred to be trifled with. To laugh at the historical figure of old Peter Stuyvesant was one thing; but to the descendants of Cotton Mather and Winthrop nothing of the kind was allowable. New England was a serious place when Dr. Holmes came into the world, just as New York was a dull place when Irving made his acquaintance with it. It was a community in which the clergyman was not only an important social figure, but in which he still retained a large share of the old Puritan legal authority. He prescribed people's beliefs, reprimanded their sins, not privately and apologetically, but sternly and openly in the pulpit. He exercised a theocratic sway over everybody, and inspired an awe in all classes of the community, which it is now difficult to picture to the mind. The very fact that there was little or no literature in the country, made his weekly discourse the intellectual event of the week. Politics was the relaxation of a community of which dogmatic theology was the serious mental occupation.

That there was behind all this gravity a native Yankee humor, which was sure to find its way into literature sooner or later, we know now, but it was hardly suspected then, at least outside of New England, and Dr. Holmes was the first to show what might be done with it. He was admirably qualified by nature for the task of introducing to the notice of the sombre New England audience the value of the humorous aspect of human life, by the very fact that he was not a satirist, and that his laughter hurt no one's feelings and shocked no one's prejudices. His verses suggested a conception of life which could hardly be called new, but which was novel in New England—as novel in another way as Emerson's pleasant eclectic philosophy, which was beginning to sap the foundations of dogma. New England was quite ready for Doctor Holmes's treatment. The community was really just awakening to the reality of modern life, to the new literature, the new learning, the wonders and magic of modern science and invention. Life was to be not only real and earnest, but it was to be amusing. Its contrasts, its folly, its queer surprises, the eternal conflict between its dreams and its reality, could be made use of to enliven its path just as well as to deepen its gloom. Mirth, and gayety, and humor, and cheerfulness were to be had for the asking, and a very competent practitioner was ready to furnish them. Of course, it is useless to inquire what would have happened to New England if the old ways had not been abandoned; but to dissipate the gloom which hung over life and society in Massachusetts fifty years ago, it was just such wit, vivacity, and cheerfulness, and natural disposition for the comic side of things as his, that was essential.

Brady, the murderer of Mr. Burke and Lord Frederick Cavendish, will be hanged on the 14th of May, within five weeks of his arraignment, after a trial lasting three days. When the villain heard the verdict in court he turned "ashy pale," showing that he knew there was no hope for him, and that there would be no delay beyond the appointed day in hanging him: no appeals on little technical points, no new trial, no chance to get more alibis or murder any of the witnesses for the prosecution, or the jurymen. We may be sure, too, that many another murdering ruffian, either in the court-room or outside in the street, when he heard of the verdict, knowing that "Joe" Brady would surely die in one month, began to turn his thoughts into innocent channels and doubt whether Ireland could really be helped by assassination and arson. When we reflect that if the bill for the establishment of a Court of Criminal Appeals passes, all this wholesome swiftness of justice will become a thing of the past, that the chance of escape for every assassin will be nearly doubled, and that the effect of a conviction upon the imagination of the criminal population will be greatly diminished by the indefinite postponement of the final judgment, we cannot help believing that decent people, in Ireland at least, must look forward to its passage with great apprehension.

Brady's solemn denial of his guilt in court is not surprising. He, of course, wishes to give himself whatever scrap of hope such a denial may contain. It will be interesting, however, to see whether he denies it on the scaffold. If he does, it will heighten the public curiosity as to the nature of the arrangement with his spiritual advisers which enables him to do this. No satisfactory explanation of these solemn asseverations of innocence at the last moment by Catholic criminals who have just received the rites which the Church only gives to the penitent, has ever been made. Of course, the Fenian explanation that a man must be innocent who says he is, when at the point of death, does not clear the matter up. If we are not mistaken, there is no recorded case of a public confession of guilt by an Irish agrarian or political murderer when on the scaffold. He usually devotes his dying speech either to denouncing the witnesses or to denying all knowledge of the crime, which seems to show that there must be some secret method of satisfying his conscience as to this mode of saving his memory. There is some light thrown on the whole state of popular feeling by the ad-

mission of Carey, the informer, that while planning his murders he was a member of a Catholic "Sodality," or religious society, whose members were bound to take the sacraments at certain stated intervals. He was probably not as great a hypocrite as this would indicate. There is doubtless some condition of the conscience, of which we know nothing, which enables these men to be "good Catholics," in their own eyes, while engaged in a certain class of crime, and to deny it to the last gasp without imperilling their salvation.

When Patrick Egan was asked by the reporter of the *Sun* the other day his opinion of Brady's conviction, he gave some curious confirmation of what we have been saying of the necessity under which every Irish politician labors of alleging the unfairness of all convictions for agrarian murders and outrages. We presume no intelligent person who knows the history of the case, really doubts that Brady murdered Mr. Burke and Lord Frederick Cavendish, but no Irish politician of the Nationalist school would dare to say so. We question, in fact, if any of them has ever admitted that a conviction of an agrarian or political criminal was ever fairly obtained. Egan, for instance, gets out of the difficulty by asserting that "the witnesses were bribed by sums varying from $2,500 to $50,000; that the jury was purchased, and that the judge who tried the case was a notorious partisan." He gives no reason, however, and apparently thinks none necessary, for believing Brady unlikely to have committed the murders, but probably, if pressed hard on this point, would insinuate, if not assert, that they were committed by the police to bring discredit on the national cause. This obligation to disbelieve all charges of agrarian or political crime is probably the hardest of all those resting on an Irish politician; to men of education like Parnell and Justin McCarthy it must be very trying.

The editor of the Associated Press despatches has fallen into the curious though small error of making Dr. Webb, the counsel for Brady at the late trial in Dublin, address the Court as "Your Honor." This is a purely American form, unknown in England altogether, and only in Ireland as an expression of real or sham respect from the peasantry to social superiors, though it is even there rapidly dying out. An English or Irish or Scotch judge of the Superior Courts is always "My Lord," or usually "Milud," and "Your Ludship." County judges and Chairmen of Quarter Sessions are "Your Worship," or popularly "Your Waship." If Dr. Webb had called Mr. Justice O'Brien "Your Honor," it would have caused great laughter. The history of the title in this country, or at least in this State, would be interesting, though doubtless hard to write. The judges here are all "Your Honor," and so is the Mayor, and everybody who has held an office, however humble; and, very often, persons considered worthy of office, even if they never held it, are "Honorable." The continuance of these titles in popular use, in spite of the stern attitude of the press and of the lawmakers toward all such marks of distinction, is doubtless a curious case of survival.

However little of genuine constitutional government there may be in Germany, there is evidently enough of it to develop the "electioneering dodge." That art is cultivated not only by the candidate for a seat in the Reichstag or in the Legislature of any of the states composing the Empire, but it seems to have been studied with the greatest assiduity and success in the "highest circles," and one of its most remarkable achievements was the extraordinary message of the Emperor sent to the Reichstag on Friday. For years it has been one of Bismarck's pet schemes to induce the Reichstag to vote the appropriations necessary for the conduct of the Government in its various branches for a period of two years at a time, instead of one. The object, of course, was to make the Imperial Government more independent of parliamentary control. But the Reichstag has so far steadily refused to curtail by its own action the few constitutional prerogatives it enjoys, of which the right to "vote the budget" is the principal one; and the proposition of biennial appropriations, therefore, failed, as often as it was brought forward, by overwhelming majorities. But Prince Bismarck is not the man to give up a project when once, or even twice or three times, foiled in it. He proposed the same thing again and again, and now at last he seems resolved to appeal from the Reichstag to the people. To do this with effect he resorted to a remarkably ingenious expedient, which shows that in the electioneering art he might "give points" to any party manager in our Presidential campaigns. The Emperor professes the same solicitude for the condition of the working classes which has always been characteristic of the Prussian kings. It had always been his desire, he says, to accompany the repressive laws against the Socialists with other laws beneficial to the laboring men. He was anxious that the Insurance Bill for disabled workingmen should pass at this session, and he would then submit the budget for 1884 and 1885, so that the next session of the Reichstag might be devoted entirely to the Sick-Poor Bill and other measures for the improvement of the social condition of the people.

That this message is Prince Bismarck's, and not the Emperor's work, is of course generally understood. That it is a consummate politician's movement for position in a campaign, is equally evident. He simply tries to array the vote of the working people against the parliamentarians. He says to the masses: "Here is the good old Emperor wanting to improve your condition. We have submitted bill after bill for that purpose. But the Reichstag prefers to spend its time in higgling over items of appropriations. Now, we propose to reduce these discussions about one-half by having them every two years instead of each year, and we want the time so saved to be devoted by the Reichstag entirely to your interests. If the Reichstag insists upon having the discussions about the budget every year, thus frittering away the time that should be devoted to you, it simply shows that it cares more for its own power than for your interests." This appeal is, of course, intended to put the Liberals and the friends of constitutional government generally in a false position. That at the present session of the Reichstag they will vote down the proposition for a biennial budget once more is a foregone conclusion. It is expected that Prince Bismarck will thereupon induce the Emperor to dissolve the Reichstag, and then in the general election try to win a working majority by uniting the working classes with the "conservative" followers of the Government against the Liberals and the Constitutionalists generally.

The declaration of Signor Mancini, the Italian Minister of Foreign Affairs, at last puts the existence of a defensive alliance of Germany, Austria, and Italy beyond all doubt. While he declines to give any specific information about the form of the agreement, he states emphatically that the object is the preservation of peace in Europe. It could scarcely be otherwise, for any attempt on the part of any one of the three allied Powers to set on foot an offensive war for its own aggrandizement would unquestionably be followed by the dissolution of the alliance. It is not unnatural that, as Signor Mancini remarked, Italy should have desired to get out of her "former position of isolation," although her new position as a sort of orphan adopted by the two most formidable Continental Powers will not be an especially proud one. But it is likely to be useful to her in an emergency. Italy has had remarkably good luck in drawing profit from the exertions and victories of other Powers, and she prudently takes care to associate herself with those which bid fair to offer the best chances.

Admiral Lord Alcester, of the English Navy, has apparently settled the disputed question whether Admiral Nicholson's crew cheered the British fleet when sailing round it after the bombardment of Alexandria. When the news of this display of sympathy for the British first reached this country, it was taken up very warmly in Congress, if we remember rightly, by Mr. Robinson, and, if some sort of denial had not been put in, might have resulted in Admiral Nicholson's being brought home in chains and prosecuted either by impeachment or some other equally dreadful process. But it must seriously be said that Admiral Nicholson's permitting the performance can hardly be called very discreet. We had nothing to do with the Egyptian quarrel, and any boisterous display of sympathy with one of the belligerents on the part of our land or naval forces was, therefore, to say the least, out of place. Such things are always liable to be misconstrued, and Lord Alcester undoubtedly misconstrued this one. He said that Admiral Nicholson "did everything in his power to aid them (the British), for which he (Lord Alcester) was afraid he would not receive the thanks of the Irish-American party." But then there is a very large body of persons in the United States besides "the Irish-American party" who do not thank American naval officers for lending a hand in foreign bombardments. Arabi probably deserved all he got, but there was even in England much difference of opinion as to the propriety of his getting it from Lord Alcester, and there may well, therefore, be a good deal here, even among native Americans.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 11, to TUESDAY, April 17, 1883, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR has been enjoying his vacation during the week in Florida. On Thursday he arrived at Sanford, and on the following day started for Tocoi, where he arrived on Saturday morning, on the way to St. Augustine, which was reached in two hours by rail. A reception was given him at a hotel there. He remained in St. Augustine until Tuesday evening, spending part of his time in fishing. The United States steamer *Tullapoosa* was awaiting his pleasure at that place on his arrival.

Judge Gresham was sworn into office as Postmaster-General on Wednesday morning, and immediately entered upon his duties.

Postmaster-General Gresham has approved a design for the new two-cent postage-stamp. It bears the profile of Washington. The color has not yet been selected. This stamp will take the place of the three-cent stamp after October 1.

Work has already actively begun in the Department at Washington under the new law, which grants an increase in the rate of pensions from $24 to $30 per month to soldiers who lost a leg above the knee or an arm above the elbow. Already more than 11,000 petitions from one-armed soldiers have been received. More than 32,000 documents in the nature of evidence, 52,000 reports, and 46,000 letters were received last month.

Prof. J. W. Collier, the Chief Chemist of the Agricultural Department in Washington, has been summarily removed, and Professor Tyler, of Indiana, appointed in his stead. Professor Collier had no notice of this removal, although it was not altogether unexpected. He says that there have long been differences between himself and the Commissioner of Agriculture as to the importance to be attached to the making of sugar from sorghum.

The supplemental report of the *Jeannette* Court of Inquiry has been completed.

Discrepancies have been discovered in the Government salary tables, which show that in many instances the monthly payments have been excessive. The overpayments may amount to many thousand dollars.

The United States Government has consented to coin the money of the King of the Sandwich Islands.

Mr. J. R. Partridge, United States Minister to Peru, recently recalled, arrived in this city on Saturday. He said that he had returned to this country to make explanations to the Secretary of State in regard to the severely criticised "note of agreement" (dealing with the Peruvian peace negotiations).

In the Star-route trial on Wednesday the third day of Miner's examination was begun, and his testimony was concluded. On Thursday James E. Waugh was called by the defence, and he unexpectedly identified certain names on a petition as having been written by Miner. Mr. Ingersoll offered in evidence Special Agent A. M. Gibson's report on Star routes as made to Postmaster-General James. Mr. Bliss objected on the ground that the report had been rejected by the Department of Justice. The Court refused to admit it. The defence was brought to a close on Thursday afternoon, and the rebuttal was begun. Friday was devoted to hearing this evidence. The fifth month of the trial was begun on Tuesday. Ex-Postmaster-General James testified for the prosecution.

William Lilley on Wednesday entered suit in Washington against ex-Senator Dorsey for $10,000 damages, alleged to have been sustained by him as a result of an assault made upon him by Dorsey on March 6 last, at the house of the latter.

The sixty-fifth anniversary of the American flag was celebrated on Friday, in Washington, at the residence of Colonel Samuel Reed, the son of the designer.

In the Assembly, at Albany, on Wednesday, Mr. Roosevelt's resolution directing the Attorney-General to bring suit to dissolve the Manhattan Railroad Company was rejected by a vote of 55 to 49. The discussion on the adverse report of the Judiciary Committee was cut off by the previous question. A resolution for a final adjournment of the Legislature on April 21 was adopted without debate, but is held back in the Senate. Mr. M. C. Murphy's Excise Bill was returned from the Senate with a few minor amendments, and agreed to. The bill now goes to the Governor. Senator Jacobs's Emigration-Commissioner Bill was passed in the Senate on Wednesday by a vote of 17 to 13. Assemblyman Donohue, of Erie County, has introduced a new bill to accomplish for the Democratic firemen of Buffalo what they lost by Governor Cleveland's recent veto. At the evening session on Wednesday the bill appropriating $1,000,000 to continue work on the new Capitol was passed by the Senate. In the Assembly Mr. Smith's bill creating a Board of Forest Commissioners was passed. On Thursday the Senate Emigration Bill passed the Assembly by a party vote. The bill permitting the selling of pools at races, under certain restrictions, was finally killed by a refusal to reconsider the vote against it. A conference report on Penal-Code amendments was agreed to, which permits the sale of ice-cream, confectionery, fruit, and prepared tobacco during the whole of Sunday, and also permits lectures and other exercises in churches, schools, etc. A bill was introduced in the Senate on Friday setting apart 15,000 acres of timber land in St. Lawrence County for an experiment on the German plan of forestry, and appointing James R. Smith, of Russell, St. Lawrence County, a Commissioner to have charge of the land. On Monday evening the Hodges bill, making it a misdemeanor to sell or give a pistol or other firearm to a person under eighteen years of age, or for a person of that age to have such weapons in his possession, was passed in the Assembly. Gov. Cleveland on that evening nominated Deputy Insurance Commissioner John A. McCall to be Insurance Commissioner. He was immediately unanimously confirmed by the Senate. The nomination is warmly approved as being according to civil-service principles, Mr. McCall having worked his way up from an $800 clerkship in the Department, with which he has been connected for eleven years. The Broadway Arcade Railroad Bill passed the Assembly on Tuesday morning.

The Court of Appeals of New York, on Tuesday, affirmed the constitutionality of the jury law in Albany County. This has interfered with the courts in that county for some time. The Sessions bribery case can now be brought to trial.

The Commissioners of Accounts—Messrs. William Pitt Shearman and George E. Hill—are now making an investigation in the City Finance Department, to ascertain the nature and extent of a series of systematic frauds on the treasury of this city. It has been learned that a large number of interest coupons on outstanding city bonds have been paid twice over during the last few years. The clerk whose duty it was to cancel the coupons upon presentation was William B. Carroll, who died in August last. He had held his position since 1872, and nothing occurred during his life to cause any suspicion of his honesty or faithfulness. It is feared that the thefts may reach $150,000.

The will of Peter Cooper, filed in the Surrogate's office on Wednesday, leaves $100,000 to Cooper Union, and about $100,000 in special bequests; the remainder, about $1,800,000, is to be divided between his two children, Edward Cooper and Mrs. Abram S. Hewitt.

It is announced that Mr. Jay Gould is about to retire from active business operations in Wall Street, leaving his son, George J. Gould, to succeed him.

A dinner was given to Dr. Oliver Wendell Holmes, at Delmonico's in this city on Thursday evening, by the medical profession of New York city. About 225 persons were present, mostly physicians. Dr. Fordyce Barker presided. Doctor Holmes read a characteristic poem, composed for the occasion. There were speeches by Bishop Clark, William M. Evarts, Dr. T. G. Thomas, George William Curtis, and Whitelaw Reid.

The seven Americans who have so long been imprisoned at Panama on suspicion of having been engaged in the robbery of $50,000 from the vaults of the Panama Railroad Company, have at length been set free. One of their number arrived in this city on Saturday. He said: "We were all citizens of the United States, engaged in business, and there was no reason for our arrest and imprisonment except the whim of the railroad company. Our Consul would not, or could not, do anything for us, and we lay, sick and suffering, in the terrible hole of a prison, unable to get a hearing, but taken down every day, one by one, into a dungeon, where a Colombian official tried to extort confessions from us. Finally we were allowed to employ lawyers from the town, and at last, on the 31st of March, after three months' unjust imprisonment, we were all released, the Colombian Government and the railroad company withdrawing the complaints against us."

A bill was introduced in the Pennsylvania Senate on Wednesday to prohibit the manufacture and sale of infernal machines and devices to destroy life and injure property. A bill was also introduced preventing any attempt at Passion Plays.

Major Phipps, the defaulting Superintendent of the Philadelphia Almshouse, was taken back to that city on Friday from Canada and locked up.

Governor Butler, of Massachusetts, on Wednesday vetoed the bill to give notaries public jurisdiction and the right to act in any and all counties.

The Marquis of Lorne arrived at Boston on Friday to await the arrival of the Princess Louise from Bermuda. A sensation was caused during the day by the explosion of a railroad torpedo on the street. The police attached no importance to the event. The Princess Louise arrived at Newport on a British frigate on Saturday. She proceeded to Boston, where she met her husband and spent Sunday and Monday. They returned to Ottawa on Tuesday.

In the suit at Boston of Lizzie Gannon against Father Fleming, which was brought to recover $5,000 damages, because the latter, a Catholic priest, had taken away some paper images to which the child had become attached, causing alleged serious injury to her health and mental condition, the jury on Wednesday brought in a verdict of one cent damages.

The Iroquois Club, of Chicago, celebrated Jefferson's birthday on Friday evening by listening to speeches by Senator Bayard, E. P. Wheeler, Colonel W. C. P. Breckenridge, and others. A despatch says: "The general drift of opinion seemed to favor Samuel J. Tilden for Democratic standard-bearer in 1884." A protection speech was made by Mayor Harrison, of Chicago, which was seriously at odds with the general free-trade sentiment.

There has been a serious strike at the Springfield, Ill., Rolling Mill. Many non-union men had been found to take the places of the strikers. On Thursday they were attacked and badly beaten by the strikers, and in the evening, as a number were leaving the mill, they were fired upon. One man was killed and two wounded.

After a three days' session the Georgia Democratic State Convention, on Thursday, nominated Henry M. McDaniel for Governor.

He was a Confederate soldier, and represents the reactionary element of the party as opposed to Boynton and Colquitt.

Parts of Arkansas, Missouri, and Minnesota were visited by tornadoes on Saturday which caused some loss of life and destroyed a good deal of property.

FOREIGN.

The trial of Joe Brady on the charge of murdering Lord Frederick Cavendish and Mr. Burke began on Wednesday morning in Dublin. Many of the jurors in the panel failed to appear and respond to their names, but in one hour a jury was secured. The case for the Crown was opened by Mr. Porter, who pointed out to the jury their duty to be guided by the evidence to be produced. The first witness called was Farrell, the informer, who repeated the testimony he had given at the preliminary examination. James Carey substantially repeated the testimony he had previously given. He gave a detailed account of the formation of the Invincibles. Carey, on Thursday, admitted that he was promised a pardon before he determined to give evidence against his fellow-conspirators. He also identified a photograph as that of the man known as Number One. It was a picture of Tynan. Michael Kavanagh, the car-driver, showed that he was under the direction of Brady, who designated the place where he was to wait for the murderers. Joseph Smith, another informer, corroborated Carey's testimony. Several minor witnesses were examined, and the case for the prosecution was closed at 3 o'clock on Thursday. The defence was then opened. After an hour's address by the counsel for the defence, witnesses were called to prove an alibi. The testimony was all in, the speeches of the attorneys were made, and the Judge's charge delivered by 3 o'clock on Friday afternoon. The jury were out forty minutes and returned with a verdict of guilty. Brady was immediately sentenced to be hanged on May 14. A motion for arrest of judgment was denied. Brady made a solemn protestation of his innocence.

Daniel Curley, another of the men indicted for participation in the murder of Lord Frederick Cavendish and Mr. Burke, in Phœnix Park, on the 6th of last May, was placed on trial in the Green Street Court, Dublin, on Monday morning, and James Carey was one of the principal witnesses. Joseph Smith and Peter Carey testified on Tuesday. The defence was opened in the afternoon. They propose to prove an alibi.

Norman, Gallagher, Dalton, Wilson, Curtin, and Ansburghe, the six men recently arrested in London, on suspicion of being connected with a dynamite conspiracy, were taken to the Bow Street Police Court on Thursday morning in a prison van, under a heavy guard, to prevent a possible rescue. Mr. Poland, opening the case for the prosecution, declared that there was no doubt, in view of the evidence obtained by the authorities, that a conspiracy was in existence in America, the purpose of which was the destruction of public buildings in Great Britain; that the factor invoked by the conspirators was dynamite; that some of the men now on trial had come from the United States for the purpose of putting their diabolical schemes into operation; that they had furnished the means and the men to establish the dynamite manufactory at Birmingman, and that Gallagher, Wilson, and Norman had visited the manufacturer, Whitehead, at his place in Birmingham, with the purpose of sending to London a supply of his explosives. Mr. Poland said he proposed to show that Norman and Wilson had repeatedly communicated with Gallagher, who was known as Fletcher. Gallagher himself communicated with all the subordinate conspirators. It would appear in the course of the evidence that Curtin also was one of the chief conspirators. Papers were found in Gallagher's luggage which referred to Ansburghe, whom Gallagher was known to have visited. O'Conner went to the United States about nine years ago, and letters showed that he had established relations with O'Donovan Rossa, McClure, and Devoy. He returned to England a short time ago under the name of Dalton. The examination was adjourned for one week at the request of the Government.

A parcel containing seven pounds of gunpowder was found recently near the office of the Secretary of State for the Home Department (Sir William Vernon Harcourt).

Three gunboats were cruising off Cork, Ireland, on Monday, waiting, it is said, to intercept a vessel from America having on board infernal machines.

Mr. Parnell says that if the Philadelphia Convention is postponed until autumn, he will attend, and he advises that step.

The Elective Councils Bill, embodying Mr. Healy's scheme for local self-government in Ireland, was rejected by the House of Commons, on Wednesday afternoon, by a vote of 58 to 231.

The trial in London of Mr. Charles Bradlaugh, who, with the proprietor and editor of the *Freethinker*, was charged with publishing a sketch of the Deity and blasphemous libels in that journal, has resulted in Mr. Bradlaugh's acquittal.

There has been a heavy decline in wheat in London, owing to large purchases from America, caused by the expectation that prices would rise on account of continuous bad weather.

Lieutenant-Colonel Sir Charles Russell, a distinguished English officer of the Crimean war, died on Saturday at the age of fifty-seven. He was a member of Parliament and a Conservative.

In the German Reichstag on Friday Herr Scholz, Minister of Finance, read an imperial message. The Emperor says he has always believed that it was his duty to manifest the same solicitude for the condition of the working classes which was shown by the Prussian kings. When the Socialist Law was promulgated, the Emperor expressed his conviction that legislation should not be restricted to police and penal measures, but should benefit the workingmen. The abolition of the class tax was the first step toward benefiting them. The Emperor is anxious in regard to the passage of the Insurance Bill, as its failure, he thinks, would hopelessly destroy any chance of passing the Sick-Poor Bill at the next session. The budget for 1884 and 1885 would therefore be now submitted in order to give the next session opportunity to consider the social condition of the people. The message was a surprise to the Reichstag, and the Liberal journals were dissatisfied with it. It is thought to be a clever expedient to effect a dissolution of the Reichstag.

The Committee of the German Bundesrath has reported favorably on the letter of Prince Bismarck, in which the Chancellor advises that the importation of hog products from America be prohibited. On Friday a regulation was gazetted against such importations.

The death is announced of Friedrich Franz II., Grand Duke of Mecklenburg-Schwerin. His mother was the only sister of the Emperor William of Germany. He was a prominent soldier in the Franco-Prussian war.

Threats have been made to destroy the Austrian Parliament building in Vienna, and it is now carefully guarded.

Sponga, the Italian implicated in the murder of Count Majláth von Szekhély, was arrested on Thursday at Pressburg, and made a confession. He attempted to commit suicide by shooting himself in the mouth. The wound is considered mortal.

The great Nihilist trial is now in progress at St. Petersburg. Many of the prisoners have made a confession of guilt. The press is forbidden to publish details of the trial. It is said that two thousand persons have been arrested in Moscow on suspicion of plotting against the Czar.

A ukase has been issued by the Russian Government ordering that increased vigilance be observed on the frontier to prevent suspicious persons from entering the country. It is supposed that this precaution is taken in view of the approaching coronation of the Czar.

Specie payments have been resumed by the Italian Government and are proceeding regularly.

In the Italian Senate on Wednesday Signor Mancini, Minister of Foreign Affairs, said the sole object of the accord between Italy, Austria, and Germany was the preservation of peace. He emphatically denied that the agreement between these countries was characterized by any spirit of hostility toward France. The Senate must be content to know that Italy withdrew from her former position of isolation. The agreement with the German Powers allowed perfect reciprocity of rights and left a free initiative to each. He also expressed the hope that he should be able to solve the question of the capitulations in Tunis, although it might be unpleasant.

M. Cazot, who was French Minister of Justice under M. Gambetta, has been appointed President of the Court of Cassation. The appointment is regarded as an indication of the tendencies of Prime Minister Ferry.

A despatch from Hong Kong, received in London on Friday, says the French Minister to China had arranged the Tonquin affair satisfactorily in December, but the new French Ministry rejected the arrangements. The result, it is said, will probably be a long and costly war for France.

A project for laying a submarine cable between Spain and Cuba is awaiting the approval of the Cuban Minister of Public Works. It is proposed to lay the cable over a route that will be divided into three sections, the first of which will unite Portugal with the Azore Islands, a distance of 1,000 miles; the second section, to extend to the Bermuda Islands, being 1,700 miles; while the third will terminate at Havana, a distance of 775 miles.

A Franchise Bill introduced by the Canadian Government into the House of Commons on Friday night enacts that adults, sons of qualified farmers and mechanics, shall have a vote. It also provides for female suffrage, giving to spinsters and widows a vote on a property qualification of $400.

News has recently reached this country of a revolution in Hayti on March 27th. At 3 o'clock in the morning of that day a revolutionary party, headed by Boyer Basslay and General Barlow, with 103 men well equipped with Winchester twelve-shooters, landed and took the town of Miragoane without any opposition. On landing, the General assured the people that they had nothing to fear from his party. He made no arrests. To all who joined him he gave Remington rifles. He immediately fortified the town. A telegram, dated April 9, says the uprising was confined to Miragoane, and that the remainder of the people are faithful to President Salomon. The insurgents will probably soon be overthrown.

A Commissioner has been sent from Queensland to take possession of the island of New Guinea as a dependency of Queensland.

Veintimilla, the Dictator of Ecuador, has offered to leave Guyaquil if the Revolutionary Government will appoint him Minister Plenipotentiary to England, with the salary of a field marshal, if his confiscated property be returned to him, and if he be indemnified in the sum of $80,000 for losses he has suffered.

Latest mail advices from Peru report increasing poverty in the country, and no immediate prospect of peace The great fire at Iquique on March 11 destroyed property valued at about $1,000,000.

THE PROPOSED PROTECTIONIST AWAKENING.

THE Bulletin of the American Iron and Steel Association has an article lamenting the ignorance of the voting population of the United States about "the protective policy," and ascribing it to a "variety of causes." These are, "the influence of certain leading New York and Chicago newspapers; the influence of New England colleges, and the scarcity of manufacturing enterprises in the South and West"; and, though last, more potent than all, the fact that "our present generation of voters has come on the stage since 1861, and therefore does not know what the country suffered under the exclusively revenue policy of the preceding fifteen years." The first three of these causes do not seem to us to admit of any remedy. There is but small chance of converting the leading New York and Chicago newspapers to protectionist doctrine, within any reasonable period, at all events. In fact, the tendency seems altogether the other way. We can point to several leading newspapers, in different parts of the country, which were at one time strongly protectionist, but are now either free-traders or warm advocates of a revision of the tariff in the direction of free trade. We do not know of one printed in the English language which has at any time within the last twenty-three years advocated free trade, and now confesses the error of its ways and preaches protection. Moreover, this change is not due in all cases, perhaps not in any case, to the discovery that the original apostles of protection in this country were wrong. On the contrary, it is the logical result of the protectionist doctrine as preached in the United States by a great, if not the greater, number of the early protectionists.

Early protection was protection to "infant" or struggling industries, which by means of protection were eventually to become able to hold their own against foreign competition without protection. The doctrine of absolute and permanent protection, or "the wall of fire" doctrine, was first brought into vogue by Mr. Carey, but though it enjoyed the advocacy of Horace Greeley when his influence was greatest, it never took much root outside of Pennsylvania. The bulk of the people were never anywhere brought to believe that a high tariff is a holy thing, to be cherished as sacred by any community which wishes to be free and prosperous, or that the greatness and happiness of states always depends on the duties they levy on foreign manufactures—like the Pennsylvania fanatic who is firmly persuaded that the decline of Turkey is due solely to free trade. The majority of the American people have always taken the tariff in sober, Anglo-Saxon way, as a political expedient of which, like all other expedients, there may be too little, just enough, or too much, as circumstances may determine. What they said in the beginning was that they would have as much tariff as was necessary to give native manufacturers a fair start, but no more. This is what they say still, and the reason why we see prominent newspapers, once favorable to high tariffs, now recommending the lowering of duties and the enlargement of the free list, is that they think they see that the original object of protection has been partly accomplished; that a large number of American industries are now either wholly or partially capable of meeting foreign competition, and are at present over-protected. This way of looking at the matter will undoubtedly last, and will hereafter produce periodical reductions of the tariff in the free-trade direction. Of this there is no sort of doubt, and our protectionist friends may as well make up their minds to it. The Carey view of the tariff reached its meridian soon after the war. It has every year since been losing what hold it had on the popular mind, and the present condition of public sentiment, which the Iron and Steel Association is deploring, is one of the results of this.

Very much the same thing may be said about the influence of the New England colleges. They simply keep pace with the progress of modern thought, about the tariff as about other things. Protectionists constantly talk as if their system was a product of the American mind, and furnished materials for what they call "American political economy." The fact is it is as old as modern Europe, nearly as old as the Catholic Church. The mediæval states lived on it, and by it, and believed in it more fanatically than any Pennsylvanian. One of the oddest things in its history was its introduction into the United States. It had really as little business here as orders of nobility or an established church. The wonder is not that it is now declining, but that it has held its own so long. Free trade, on the other hand, is only a century old, but it is winning its way slowly, just as the Copernican system and religious toleration won it, and Darwinism is winning it. There is about as much chance of expelling it from the colleges now as of expelling them. The influence of colleges on political thought in this country may be great or little, may grow or decline, but we may be sure the future professors of political economy will all teach freedom of exchange.

It would seem at first sight as if it would be an easy thing for protectionists to enlighten "the young and middle aged men of this generation," whose appreciation of protection is declining, by acquainting them in detail with the horrors of the fifteen years before 1861. The reason why this is not done becomes very plain, however, when one looks at the figures. Between 1850 and 1860 the population grew in the normal American ratio; the exports nearly doubled; the imports nearly doubled (which is more than they have done between 1870 and 1880), and the revenue rose from $40,000,000 in round numbers to over $53,000,000. These are the more prominent indications of national prosperity. The minor ones were equally satisfactory. In fact, the fifteen years before the war were, from the commercial point of view, among the happiest in the national history, and it is not wise for protectionists to call the attention of young or middle-aged men to them.

Nor is there the comfort that the Bulletin thinks there is in the letters which that "strong man of the Tariff Commission" is sending home from England about the condition of the English laboring class. The objection to them is that they suggest a comparison between what England was under the high tariff with what England is under free trade. The contrast which this comparison always presents is the most damaging fact in existence for the protective theory. England, since she gave up the tariff, has sprung into prosperity such as the old protectionists never dreamed of, literally by leaps and bounds. The revenue has risen enormously; wages have risen; the consumption of necessaries and comforts by the working classes has greatly increased; production in every field of industry has grown with amazing strides; pauperism has wonderfully diminished; trade has pushed into remote regions of the globe as never before. Therefore, whatever Mr. Porter does, he must not describe the effect of free trade on the English people during the last forty years.

CONGRESSIONAL FOSTERING OF ART.

THE petition of the American artists resident in Paris, against the duty of thirty per cent. on foreign pictures which has been inserted in our revised tariff, is pathetic reading. They have gone over there to enjoy the benefit of the art collections in the French capital, to which they are cordially welcomed. They receive gratuitous instruction in the French Government School of Fine Arts. They are allowed to copy the old masters in the French museums. Their pictures are freely admitted, and have been liberally honored with prizes in the French exhibitions. More than all, and in this case harder than all to have to tell, many of the leading French painters give private and gratuitous instruction to all Americans desiring to study under them. In apparent return for this we have clapped a virtually prohibitory duty on French pictures, and it is not surprising that the French, in the first moments of irritation, should talk of closing the School of Fine Arts to American students, and of withdrawing the privileges hitherto accorded in their galleries to American artists. What, of course, makes our tax seem all the more marked in its intent is the fact that no other civilized nation imposes it. We are the only civilized people whose Legislature thinks it a good thing to make it difficult for its citizens to see foreign works of art; and it would not be surprising, therefore, if the French thought that we were animated by feelings of savage hostility to their painters.

We are particularly sorry for the American artists in Paris, because on them devolves the task of explaining to foreigners the mental attitude of the American politician toward literature and art, and every one who has ever tried it knows how difficult this is. It is almost impossible to make a Frenchman or German understand how it is that to a large body of our legislators and men in public life, and even to some of our publishers, books and pictures are simply merchandise or things to sell, and not by any means instruments for the improvement of the human mind and the elevation of character; or how it is that to Congress the "manufacture" of books is a much more important interest than the composition of them—

the paper and binding far better worth taking care of than the thinking which finds expression in them—and that, therefore, one well-bound and well-printed book is as good as another, just as one piece of pig-iron is as good as another; or how it is that to the ordinary Congressman a picture is simply so much furniture, like chairs and sofas, used by well-to-do citizens to fill their rooms up, and that, therefore, the use of the native picture ought to be encouraged by the same means which are used to encourage the native carpet and wall-paper. All this can only be explained to a foreigner by persons possessing remarkable powers of exposition, and using their mother tongue. Very few Americans, however well they speak French or German, are sufficiently at home in either language to do it successfully. In some of its aspects, expounding the protectionist Congressional mind to a stranger is very like expounding Kant or Hegel—something which nobody who does not possess extraordinary mental subtlety, combined with remarkable powers of expression, will attempt.

Nor is it easy to overcome the protectionist Congressman by questioning his judgment in matters of art. He is very touchy on this point, and has always maintained that he is as good a judge of a picture or statue as any one in the world, because he maintains that all art is purely imitative, and that he can judge whether a picture resembles what it purports to represent, just as well as he can tell whether a photograph is a good likeness. He consequently does not look with a lenient eye on the practice of going abroad to study art, for he maintains that there is nothing worth imitating that cannot be found on this continent. If an American wants to paint a man, let him paint one of his countrymen from life; if a horse, an American horse; if a house, an American farm-house; and in the earlier stages he can get far more aid from photography than from the instructions of Couture or Meissonier or any monarchical painters. About the value of "the old masters" he is highly sceptical. To him they are "fossils," of no more account than very old men in politics usually are.

In this particular case, we believe, the rise in the duty on foreign pictures was due to a West Virginian farmer—Mr. Boteler of the Tariff Commission—who is deeply impressed with the necessity of building up native art by a judicious use of what has built up so much other native industry. The Commission and the Senate Finance Committee were quite taken with the idea, and adopted it. And we must remember, in extenuation of his folly, that he could now fortify himself by the demands which some of our artists at home make from time to time for protection from foreign competition, and by the extraordinary petition which was signed by some of our authors a few weeks ago asking for a duty on foreign books as a protection against foreign ideas.

All this shows that the tariff, in many minds, has become a sort of American fetish, to which some of us have got into the habit of turning for relief in times of sickness, sorrow, or adversity. When we are suffering from malaria we put up the duty on quinine. If the winter is very severe, we put it up on foreign clothing. If rents are high, we increase it on lumber and nails and paint; if we are startled by popular ignorance or illiteracy, we raise it on books, and paper, and printers' materials. If we want more railroads we raise it on iron. If we sigh for more art in our lives and homes, we increase the duty on pictures, or engravings and statuary. In fact, no African fetish or Italian saint's image has harder work to do for its worshippers than our tariff has to do for some unhappy or unsuccessful Americans.

FIRST IMPRESSIONS OF NEW ORLEANS.

New Orleans, March 21, 1883.

The cisterns in New Orleans are the first things that catch the eye of a stranger. They are well-nigh as lofty as the houses, and almost ornamental. Covered at top with a canopy rising in a pinnacle, and festooned below, as well as gayly painted, they have some resemblance to Oriental kiosks or pagodas. In fact, they are such a necessity that they might naturally be venerated with religious homage. The Mississippi, polluted by the offscourings of a hundred cities, is so unfit to drink that horror of whiskey is driven out by greater horror of water. Cisterns cannot be subterranean lest the poisonous water which saturates the soil should leak into them.

In every point of view water in New Orleans is a curiosity. Walking out on my first morning there, I asked, "Which way is the river?" The answer was, "Look at the water in the gutters; it always flows away from the river." The vast current permeates the levee and pushes countless streamlets through it. These waters course across the city to Lake Pontchartrain, and sometimes glide as swiftly as the living streams in German Freyburg and Salt Lake City, for their starting-point is ten feet above the sea-level. But on arriving at the Lake they are lower than its surface, and would generate an infinite Slough of Despond and disease were they not pumped up by steam engines and thrown over the dike into salt water. Unfortunately the contents in many gutters are stagnant, and hence become mothers of malaria fatal to everything but mules and mulattoes. It is still remembered to the credit of General Butler that to all such plague spots he sent men with wheelbarrows of lime for disinfection, a sanitary step not often taken now.

"Boston ice," a survival from old times, is not uncommon on signs, but the home-made article is now much superior. A single factory daily turns out a hundred tons in winter, and half as many in summer, which is retailed at forty cents a hundred. It is manufactured from distilled water in lumps four feet long and one broad. No glass is clearer. Frozen in one of these masses I saw a bouquet—a red rose, with four yellow ones round it forming a cross, and all in the ring of a wreath of violets. All were as plainly seen as within a case of French crystal.

The rush and span of the river when at its fullest bring conviction to every b holder who has read incredulously that its volume equals the output of all the rivers in Europe. But the levee, slight as a railroad grading, low and faced with boards thin and half of them rotten, seems to a stranger ready to yield to the wash of the waves, and begging some almighty power to say: "Hitherto shall ye come, but no further." He looks to the mammoth steamers moored along the shore as arks, in which he may be glad to seek refuge from a general deluge. Houses of the old type seem with reason raised on stilts or posts ten feet from the ground.

But if earthworks appear frail, those of stone do not. It would be hard to mention more massive structures anywhere than the Custom-house and the St. Charles Hotel. No pavements are of more ponderous blocks. In this region, where no stone bigger than an orange was native, the better building stuff was largely brought as ballast by ships from Boston coming for cotton and sugar. After all, the percentage of wooden houses with balloon frames is enormous, probably no less than in Chicago before the fire, when it was still nicknamed "shanty town," and greater than it could be here did not the houses stand too far apart for fire to spread. "Far apart" in truth are the houses of the Crescent City. No place of its population, as I think, covers so many acres. The distances would be still more magnificent in the estimation of tourists but for an excellent system of street cars, many of which run between double lines of over-arching trees.

The front yards of New Orleans are its most fascinating feature. For many a mile along Prytania, St. Charles, and other avenues every man does his best to surpass his neighbor in the outside show of flowers, shrubbery, and semi-tropical trees. The result is that the pilgrim who has left a foot of snow in Wisconsin, here rides for hours where he fancies himself in a conservatory like Alexander Mitchell's magnified a million times. The houses are painted as bright as the flowers; those without pillared porches in every story, suggestive of life in the open air, are the exceptions, and the palings, whether of wood or iron, are open lattices, which do not obstruct the view. But whenever I wished to make a call I found it impossible to open the front gate and that it was fast locked. Closer inspection showed me on the gate the bell and name plate which in other cities are attached to doors, while the door itself lacked these appendages, for the same reason that Mammoth Cave crawfish lack eyes. On asking the reason of this custom, in such sharp contrast to the recent throwing down of fences in Northern towns, I was told that fortifying outworks were necessary as a safeguard against tramps, alike thievish freedmen and poor white trash, who secrete themselves in every nook, watching for plunder without if not within.

The gardens in the city made me desirous of seeing the suburban plantations. These were laid out, like the farms of *habitans* on the St. Lawrence, with a narrow river front but very deep, perhaps to give all a chance for water transport, though this style of arranging lots may have been adopted in order that the settlers, dwelling in social compactness, might enjoy a mass every morning and then a dance every night. Crossing with a single oarsman the brimming river, a mile wide and more than 100 feet deep, at the suburb of Carrollton I visited the orangery of Major Rountree. Its frontage is about 700 feet, its depth a mile and a half. The trees are 7,200—each a rod from its neighbor. The sour orange, as more hardy, is planted, and on that stock all desired varieties are engrafted. After many experiments and observations the owner prefers to raise the Jaffa rather than any other orange. During my own travels in Spain, Sicily, Italy, and Palestine, I nowhere saw orange orchards so luxuriant as in Jaffa. Wheat there grew between the trees, but Major R.'s intermediate crops are of cabbages and cucumbers. His boss, who has served him eight years, is black, and all his hands are of the same color.

Fourteen good school-houses have been built out of the bequest of McDonogh, and great hopes are entertained from the bounty of Tulane. Yet I see conclusive proofs that people who can ill afford to pay tuition send their children to private schools and not to public. In the Straight University, delightfully situated on the shady and spacious esplanade, I see more than three

hundred colored scholars, and am told that I should see a hundred more out of Lent. Seventeen of the Freshmen have made fair progress in the 'Anabasis.' No other university, so far as I know, admits students at so early an age, for I meet some here who are just entering their fifth year of life.

Among suburban retreats, Spanish Fort and West End, on the lake, are charming, and easily reached by dummy cars. Within the heart of the city, before the Cathedral and in other quarters, parks each of one single block in extent are not wanting. In one of these, Lafayette Square, there is a noble statue of Franklin leaning on an oak riven by lightning. It looked doubly lifelike when I saw it the other evening illuminated by electric light, waking as it were to newness of life to rejoice in a new application of his discovery. It is poetical justice that electric devices do their best in homage to their father. Franklin's back is turned on the City Hall. He may be thought to have taken that attitude in scorn of the city library, which it is not pretended contains more than 15,000 volumes, has now no appropriation for its increase or support, and shows very few readers. Worse than this. Certain manuscript records, relating to early State history, obtained from France, and carried off to Wisconsin as spoils of war, but restored by the Historical Society of that State to Louisiana, have been valued so lightly that they are now lost, and the venerable historian Gayarré laments to me that the historic jewels ever returned from their Northern captivity.

Yet, taking it for all in all, I am sanguine regarding New Orleans. Its drawbacks are eddies, its progress must be like the stream of its matchless river. Before experience I could not believe it would show to me, who saw it last of our twenty-five foremost towns, so much both new and notable as I have daily here beheld. Notwithstanding, while having both hands full of discoveries, I can only open my little finger.

J. D. B.

MR. BRIGHT AT GLASGOW UNIVERSITY.

LONDON, April 2, 1883.

THE four Universities of Scotland have retained an interesting piece of mediæval usage in the election of their respective Lord Rectors by the votes of the students. The Lord Rector is a purely ornamental officer, who has neither to teach nor to rule the University; his powers are confined to the nomination of an assessor to sit in the University court, a small body which administers the financial affairs and chooses the professors. Thus the habit grew up in the end of last and beginning of this century of choosing eminent men quite unconnected with the University, and perhaps with any university, to the office of Lord Rector. It is now a purely honorary distinction, whose recipient has nothing to do except to appear once during his term of office (formerly one year, now three years) and deliver an address to the students. Many notable people, statesmen, philosophers, men of science or of letters, have filled the post, and some of their addresses, like those of Brougham and Macaulay at Glasgow, of Thomas Carlyle and Mr. Gladstone at Edinburgh, of John Stuart Mill and the late Dean of Westminster at St. Andrew's, possess a permanent literary value. At present, in the dearth of eminent philosophers and littérateurs, there is a tendency to choose persons distinguished in public life, politicians. It seldom happens that a rector, whether a politician or not, is elected without a contest. The Liberal and Tory parties are both organized, and indeed well organized, in the Scotch Universities, and the contests, which begin a week or so before the voting day, are carried on with great spirit. Meetings of the students are held, speeches are delivered, handbills are profusely distributed. On the Continent of Europe political clubs among university students are forbidden, and though they exist in Oxford and Cambridge, the undergraduates have no sort of share in university government, still less of bringing political partisanship into it. However, no substantial harm occurs in Scotland, unless it be thought an evil that youths of sixteen should pledge themselves to views which they may afterward wish to forsake. The result—that these elections often turn on political grounds, so that persons not of an academical type are raised to an academical office—is not really mischievous, because the office itself has so little to do that any deficiencies in its holder do not injure the University. In fact, as regards the students, it exists only to enable them to play at electioneering once in three years (not such a useless part of their education), while to the rest of the world it gives a morning's entertainment in the address which the Rector delivers, and which is, of course, published in all our newspapers.

Mr. Bright was more than a year ago chosen Lord Rector of Glasgow University, and a few days ago he was formally invested with the dignity, and gave his address. He is as unacademical a personage as a really eminent and cultivated man can be, for his cultivation is entirely of the modern and domestic English type. He never was at a university, and at school learned little of Latin and of Greek—mere scraps, which have long since perished. He has not given evidence of having studied the literature of any Continental country, while for physical science he seems to have no interest or knowledge beyond what every intelligent man who lives in an age of inventions must have. What he does care for and has diligently and lovingly studied is modern English literature, and especially Milton and the poets who have followed him down to our own time. They are no mean instrument of training, and their influence is often felt in the correct and finished diction of his speeches. Observations upon them, or upon that art of oratory which he has cultivated with such conspicuous success, would have had a great interest for our public as well as for his University audience, and it was hoped that his address would contain something of the kind. However, he probably thought that his way of studying poetry was not a sufficiently critical or erudite way for a set discourse on an academical occasion, and he therefore fell back on the topic with which his mind seems to be always filled, the moral responsibilities of nations, and the aims toward which their efforts ought to be directed. His speech was a recapitulation of the mischiefs done, in Great Britain especially, by a warlike and aggressive policy in times past, and an earnest appeal to forsake all such objects in the future, and concentrate the activities of statesmanship on reducing the burden of taxation and improving the condition of the poor. It is an understood thing that rectorial addresses are to have no political complexion; and Mr. Bright repeatedly protested that he was not speaking as a politician, and desired his censures to be taken as applying to both our parties alike. However, as the doctrines he enunciated were the same as his platform and House of Commons speeches have always contained, and as peace and retrenchment are the constant watchwords of the Liberal party—national honor and greatness, of the Conservatives—his effort to appear non-political had a very moderate success. The ideas of the address were not new, and could not be. There was not even much novelty in his way of stating them. Such effect and impressiveness as the address had, it derived partly from that sustained elevation of style which Mr. Bright, almost alone among our orators, possesses, partly from the obvious earnestness of the speaker, and the consistency with which, during a long and active life, he has maintained the same doctrines—maintained them just as faithfully and even more vehemently when they exposed him to obloquy and defeat, as now, when they obtain a more general adhesion. It is this fact, and the circumstance that he should make so solemn a deliverance of his mind in a capacity which no one could ever have predicted for him in his earlier days—that of nominal head of a seat of classical and scientific learning, founded by a Pope in the fifteenth century—that give their interest to the speech and the occasion.

The reception accorded to the address was significant of the position Mr. Bright has now reached. Thirty years ago he was regarded as *par excellence* the popular and Democratic leader, and, therefore, a dangerous man, a revolutionary. His opposition to the Crimean war in 1854 made him very unpopular. His opposition to Lord Palmerston's Chinese war in 1857 cost him his seat for Manchester. He was denounced as a man thoroughly unpatriotic, devoid of a sense of the honor and dignity of England; a manufacturer, who, to sell his goods, would have the country submit to any humiliation. He was also represented as the enemy of property and education; the man who sought to hand over all political power to the ignorant masses. In fact, he had become the typical demagogue, against whose designs the *Saturday Review*, then rather a Liberal than a Conservative organ, and by no means the organ of Toryism which it has now become, used every week to warn its readers. When, some fifteen years ago, Thomas Carlyle, being chosen Lord Rector of the University of Edinburgh, delivered an address, very eloquent and solemn, to the students, upon those virtues of silence which he celebrated so much more in precept than illustrated in practice, *Punch* appeared with a cartoon in which the Sage of Chelsea was represented sitting alone, with his cloak wrapped round him, in an attitude of pensive dignity, while John Bright, on the other side of the picture, and labelled "Brummagem," was declaiming to a vulgar crowd.

Since those days the fame of the Chelsea Sage, not indeed as a writer, but as a moral teacher, has declined, while that of the "Birmingham Demagogue" has steadily risen. The change took place about the year 1867, when the suffrage, for whose extension Mr. Bright had agitated, was extended by the Tory Reform Bill further than he had demanded, and was completed when he was induced, not without some pressure, to join Mr. Gladstone's Government in 1868. He had now stepped into the ranks of responsible statesmen, and become one of those who were accused by brother Radicals of not going far enough, and of being too much enslaved to the property-holding classes, too slow to gratify popular demands. People began to discover, what those who observed him closely had known long ago, that he was anything but a destructive, being indeed deeply attached to the Constitution of England, with its ancient traditions, a friend to the Crown, and jealous of the honor and privileges of the House of Commons. Moreover, the fear and dislike of the Conservative party had begun to find another object. Mr. Gladstone became, on Lord Palmerston's death in 1865, the virtual leader of the Liberal party, and his increasing Liberalism and incessant activity drew upon him most of his opponents' fire. The more dangerous Mr. Gladstone seemed to become, the less spe-

cially dangerous did Mr. Bright appear, the rather as he had now ceased to be an agitator, and, when he spoke, spoke as one of Mr. Gladstone's colleagues. Many of the measures he had advocated, such as the disestablishment of the Episcopal Church in Ireland, vote by ballot, the abolition of church rates, were carried—concessions which showed that he had been right all along. Meantime, he himself was growing older, a circumstance which is doubly in favor of an eminent man: firstly, because people become more interested in him and prouder of him as a part of their national history; secondly, because he seems less formidable when the term of his activity is drawing toward its close. Nor must it be forgotten that although the free-trade struggle, in which his first triumphs were won, has begun to fade from the memories of this generation, his views on foreign policy, his protests against war and annexations, have found favor with an increasingly large section of the people. Thus, from being the best-abused man in England, he has now stepped into the place of an aged worthy, whose speeches every one hears or reads with admiration, and all the more because he speaks so rarely; whose fame is almost national property; and the purity of whose motives is not impugned even by those who question his proposals.

This appeared in the treatment his rectorial deliverances have received. Some newspapers called his doctrines unpractical; others remarked that they had been often advanced by him before; but every, or nearly every, organ was respectful and friendly. Next to Mr. Gladstone himself, Mr. Joseph Chamberlain has now become the pet aversion of the Conservative party, and Mr. Bright has little further hostility to fear. He always speaks now as if he belonged rather to the past than the present. He is retrospective, and seldom fails to celebrate the glories of the old free-trade struggle; he is not prospective, and does not grapple with the problems of the future. Indeed, he remarked at Glasgow that the topics of political strife in England seemed to be getting exhausted—a hopeful view which few men in England will share. The doctrine of non-intervention, which he advocated so earnestly, is so far from being generally accepted that it is not even held by a majority of the Liberal party: we are likely to have many party struggles in future over foreign and colonial affairs. Other questions, regarding the land, the Established Church, the readjustment of political power, are already rising above the horizon, and are sufficient to occupy politicians and provide matter for angry controversy for thirty years at least to come. It is a misfortune for England that no statesman of that old Puritan type which Mr. Bright embodies is rising up; no one who combines so much reverence for the Constitution and so austere a view of national morality with such warm popular sympathies. The radicalism of the younger generations—for two generations younger than his have now appeared on the stage—is a different thing from his, and, if wider in its intellectual outlook, is hardly so high and pure in its tone.

Y.

GERMAN ARMY AND NAVY INTRIGUES.

BERLIN, March 25, 1883.

THE sudden change in the Secretaryship of War and the Navy still occupies the public interest, but is shrouded in deep official mystery. Such an event, if not brought about by a Parliamentary defeat or by a political revolution, ordinarily does not produce much excitement; but in the present instance the resignation of two prominent public men is followed up in all its real and imagined details, and deserves something more than a mere passing notice, even in a foreign paper. This case lays open to all the world the poor beginnings of our constitutional life, and forms a very instructive chapter in modern German politics. To characterize its bearing in a few words, it is the triumph of military martinets, of the absolutistic system of old army notions over the modern views of constitutional and military policy.

General Kameke—to begin with him—was the successor of Marshal Roon, and has for ten years been Secretary of War. While Roon was a fighting character, passionate and impetuous, always ready to insist upon his own and the army's prerogatives, and bent upon picking a quarrel at every opportunity, Kameke was of a propitiating and mild disposition, who never went to extremes and always found means to reconcile opposite aims and contrary views. Thus during his whole career as Minister of War he never had a difficulty with the Reichstag, and by his winning manners effected more than others could obtain by brusque threats and intimidation. Although the Reichstag has only to deal with the Secretary of War, there is besides him a military cabinet under the immediate control of the Emperor. In a great many questions, especially in those respecting personal matters and promotions of generals, it is more powerful than the Minister, who, although the superior of the chief of that cabinet, must, notwithstanding, try to get along with him as well as he can. The present incumbent of the latter, General Albedyll, is a special favorite of the Emperor, and at the same time one of the leaders of that ultra-conservative wing of old soldiers who despise everything which is not absolute in its tendencies, and accuse of high treason all those who have an opinion of their own in military matters and dare to pronounce it. To these gentlemen the Emperor is the sole master of the army, and his generals are but servants carrying out his orders. General Albedyll is a very subaltern character, a pliant tool and a type of a whole class, which regards drill and parading as the gist and real essence of military life—one of those generals who, when in 1871 they came back from France, cried out, as if relieved: "Heavens be thanked that the sport of war is over, and that we can now return to the earnest of life."

Under the influence of the late war and the victories brought about by the people in arms, this party among the higher officers had not been able to obtain a majority in the Emperor's councils; but since Bismarck has joined it it has gained ascendancy from day to day, until at last it felt strong enough to offer battle to its opponents. The pretext under which hostilities were commenced was a very shallow one. Kameke, in the eyes of these ultra-conservatives, had not shown pluck enough in his dealings with the Reichstag; the first attacks, therefore, were directed against him. Some six weeks ago the Government had introduced a bill into that body, according to which the pensions of army officers were to be increased. The Reichstag in principle did not object, but as a consideration for its approval demanded that the officers henceforth should pay local taxes on their incomes, like all other citizens and civil officers. This demand was refused by the Government. Finally, however, a compromise was arrived at by which military officers were bound to pay local taxes on their private property only. General Kameke quite unequivocally expressed himself in favor of this compromise, and it was universally expected that thus narrowed down the bill would pass. This reckoning, however, was made without the Emperor. The army is his hobby, and the older the old gentleman grows (he was the other day eighty-six years old), the less he tolerates even the slightest opposition in army matters. The military clique around him very adroitly availed itself of these feelings. They frightened him with tales of an interference of the Reichstag with the internal affairs of the army; of signs of independence and even opposition among generals; and of Kameke's alliance with the Liberal parties, which of course did not exist. Consequently a military conference was called in which—the Emperor presiding—Marshal Moltke, Pape, the commanding general of the guards, Stosch, the Chief of the Admiralty, and Albedyll, the Chief of the Military Cabinet, participated, and in which the above question of local taxes was discussed. Stosch was the only member who spoke on Kameke's side in favor of the compromise; but the majority concluded to reject it, although the Government was bound to it by the official declaration of one of its ministers. Nothing, of course, now remained for Kameke to do but to resign, for besides not having been invited to the conference, he was openly disfavored, and as a gentleman could not stand such an insult. The respect and the regard of the independent men of all parties followed him into his retirement.

It was for a time very difficult to find a successor. General Blumenthal, in 1866 and 1870 the Chief of Staff of the Crown Prince's armies, politely declined and pleaded old age. Quartermaster-General Waldersee, ambitious as he is, nevertheless preferred to bide his time, apprehending that under the old Emperor he would hold his office for too short a time; and consequently spares himself for future emergencies. Finally General Bronsart was appointed. He is said to be a very able and even superior officer who distinguished himself in the last war. The principal question, however, is, whether he has an idea of what is expected of him, and whether he has backbone enough to resist any undue influence. The reactionary clique which has carried his nomination longs for a new conflict, in order to make itself still more indispensable and to have the army under its thumb. I apprehend that the new Minister will submit to its dictates.

Another interesting fact which is connected with this new appointment is the change which has taken place in the position of the Chief of the Military Cabinet. This officer has thus far been unknown to the Reichstag, as he was a subordinate of the Secretary of War. Now, since the accession of General Bronsart to power, and by a decree of the Emperor, he occupies a coördinate position with the Secretary. The Imperial decree, being in opposition to the letter and spirit of the Constitution, will of course not fail to provoke the attacks of the Reichstag and engender new disagreement and strife.

General Stosch was not, like Kameke, compelled to resign, but for substantial reasons preferred to do so. His department was not directly concerned in the decision which was rendered in the pension matter, and besides he had been invited to give his vote. If, nevertheless, this deserving officer sent in his resignation, it was provoked by other considerations. As Chief of the Admiralty General Stosch was under the direct orders of the Emperor, while in the routine and administrative business he was only subject to the Chancellor. This arrangement has always been against Prince Bismarck's wishes, who, for the reason that he alone was responsible to the Reichstag (what a sort of responsibility!), wanted to treat him like all his subordinates. On this point, however, the Emperor did not yield, while he had no objection to the other occupants of the highest Imperial offices being only Assistant Secretaries of State under Bismarck, partly with the title of Minister, but at all events the inferiors of the Chancellor. Thus far the Emperor perseveringly stood on the side of Stosch

and frustrated all Bismarck's plans to remove him. In the new situation, however, Bismarck allied himself with the reactionary military clique and availed himself of the favorable prospects offered by Kameke's resignation. Stosch, on the other hand, understood at once the sudden change. His resignation, sent in on March 14, was refused by the Emperor in the most flattering terms, so that Stosch was induced to withdraw it. Then Bismarck stepped in again, and in a long memorial most uncouthly declared that politically he could and would not be responsible for the administration of General Stosch. A similar insult has probably seldom been offered by one minister and one member of the Cabinet to another. General Stosch thereupon at once sent in his second resignation, in which he energetically remonstrated against Prince Bismarck, and which, on March 20, was finally accepted by the Emperor.

The discharged minister is a prominent organizing officer, who has been the real creator of the German navy, an upright and energetic man. His former subordinates think very highly of him, and deplore his loss. I do not believe that he will be doomed to inactivity and leisure forever. To the great mortification and regret of all our navy officers, an infantry general has been appointed his successor—a gentleman by the rather uncommon name of Concha di Caremba Caprivi Caprara di Montecuculi. His father was a prominent criminal jurist and an able judge of the Prussian Supreme Court, and his mother the daughter of a president of a Berlin college, so that from the full and high-sounding name of General Leo von Caprivi you cannot conclude on Abruzzian or Sierra-Nevadan origin. The new minister is comparatively young (born in 1831) and has a splendid record as Chief of Staff of the Tenth Army Corps during the last war. Whether he will be able to master the details of his new department as quickly and thoroughly as General Stosch, remains to be seen; but so much is certain, that for the present he can only be the executive tool of Bismarck and the Military Cabinet.

Admiral Batsch, the first in command after General Stosch, and an old, experienced sailor, felt especially hurt at the nomination of an outsider like General Caprivi, and sent in his resignation. Having belonged to the navy from the first, and enjoying the confidence of all his comrades, he might have expected not to be altogether overlooked. The Emperor, however, appealed to the patriotism of the old tar, who thereupon withdrew his resignation.*

As far as I am able to judge the present situation, Bismarck, surrounded as he is by scores of self-created difficulties, has no other means left to carry through his plans than to send home the Reichstag and appeal to the people for a new one. A popular pretext for doing so will easily be found. The charge of indifference of the Reichstag to the army, and of the narrow-mindedness of its majority toward the heroic defenders of the country, will find so strong an echo in the heart of the old Emperor and among the peasantry that it may secure an ephemeral success for Bismarck's policy. That there is a certain method in driving the army into wild passions and animosities is evident from many signs. These stratagems are the more to be deplored as they are perfectly uncalled for, and as the soldiers do their duty much better without them. Thus, on the Emperor's last birthday, a Colonel Rosenberg, the commander of the Zieten Hussars, addressed his regiment in the following style: "Hussars, our Emperor is the truest and best patriot of all. I am sorry to say that in his devotion and solicitude to render his people happy, he is often checked by his opposing subjects. On this day we will again resolve not only to protect the beloved Emperor against enemies from abroad, but also to suppress those who at home try to embitter the last years of his life. The day will come when you will change your soldier's calling for civil duties; but always remember that you will best honor your noble regiment by always fighting against the enemies of your Emperor." Now, there is no people in the world that, often to meanness, is more loyal to its dynasty than the Prussian. I am sure that the soldiers did not understand one word of the Colonel's harangue. However that may be, Bismarck is not fastidious in the selection of his means, and, if need be, he will choose other pretexts for carrying out his plans. An accident may just as well help him; a budget or internal-revenue question may finally better suit him. It is his old custom to have half-a-dozen arrows on his string. Perhaps he will avail himself of all of them in the arraignment of the Reichstag. †††

* He has again tendered it.—Ed. Nation.

THE CORRESPONDENCE OF GEORGE SAND.—II.

Paris, March 26, 1883.

Madame Sand received the confidences of many persons unknown to her. She was very conscientious in her character of spiritual adviser, though her spiritual advice was not always very good. She had herself very early been led astray from the straight road, and she had wandered among many doctrines and many strange men. As a novel-writer, she had not had any doctrine; she had recognized the legitimacy of passion, but had never understood that passion must be made obedient to certain rules. She loved nature with a pure love; she was in a certain sense religious, but she did not like any established religion. She writes to Mlle. de Chantepie, who was a good Catholic: "I do not believe in the Catholic institution, and any fixed form in the practice of worship seems to me an obstacle between God and the soul. . . . You form for yourself too narrow an idea of God, and you only see in him a judge in the image of man. . . . Your brain must be ill; I have often bade you change your locality by travel. Go to Paris, shake off this sad melancholy, which has nothing in it agreeable to the Divinity or useful to mankind." The purest sentiment in Madame Sand was her affection for her children. She had made herself a botanist to please Maurice; she collected plants and shells for him, and helped him in his classifications. She made him also a writer: Maurice composed a book, called 'Masques et Bouffons,' on the traditional characters of Italian comedy, with fine engravings. A copy was sent to King Victor Emmanuel, by the kindness of Prince Napoleon, who was Victor Emmanuel's son-in-law. "This book," says Madame Sand to the Prince, "is homage rendered to Italian genius, and it has a right to be placed at the feet of the Liberator of Italy." You see what a courtier she was becoming. Speaking of the *re galantuomo*, "The terrible hero!" she says to Prince Napoleon; "he has forced me to give up the idea of a united Italian republic! Before so much patriotism, courage, loyalty, simplicity (and simplicity is the mark of true greatness), all theories are wrong: the heart is taken by force—and it is the heart which governs the world."

It is rather surprising to find Alexandre Dumas, jr., the sceptic, among the persons who are under the spiritual guidance of Madame Sand. I doubt if he was very docile; at any rate, she talks to him like a father—she even explains to him that he must not take too much iron (in 1860 Alexandre Dumas seems to have been unwell). Iron, in certain forms, she observes, merely becomes ink in the stomach, and can do no good; he must only take a certain salt of iron, and she gives the formula. Then comes the spiritual advice: "Our great evil is excitement; but it would be another to suppress it altogether, for we are not made like birds and positivists, and the total absence of emotion, of work, even of fatigue, throws us into atony, the greatest enemy of our organization. . . . Medication and absolute repose kill us." Dumas had been complaining of being discouraged. "Don't say so to anybody but me; think of all the jealous people who would rub their hands. The jealous people means everybody—not only professional rivals, but the lazy, the incapable, who suffer when they see you leading a triumphant and brilliant life; it means the whole public, which is ungrateful, and which likes to see you suffer after having applauded you, and which will applaud you still, if you resist." She calls him "the spoiled child of destiny"; and there is much truth in the expression.

Madame Sand had, in the latter part of her life, become very fond of science; she found in it a new source of inspiration. She read the whole of Humboldt's 'Cosmos'; she read often what she did not understand—it was enough for her to find in some descriptions of natural phenomena a certain color, a certain beauty of which she was ignorant. Her descriptions of natural scenery become more precise. There are some charming pictures of the neighborhood of Tamaris, on the southern coast of France, where she spent some time with Maurice in the winter of 1861: "The solid Aleppo pines, with their majestic parasol, and the rough cork-trees, are not shaken by the tempests, . . . nor, in spite of these, are the olive-trees more or less pale. Among these insensible trees, the real spring plants begin to smile. The tamarisks, the purple and red anemones cover the soil, and the orchids flower in the shade."

While she was at Tamaris there was some question of giving her the "prix Gobert" of the Academy. Several members of this body had put her name forward for this prize, but the majority of the Academy was not in her favor, not finding her novels sufficiently moral. The Emperor Napoleon, hearing of this, spoke of giving Madame Sand some sort of compensation. She wrote on this delicate subject, May 11, 1861, to a friend in Paris: "Buloz [the editor of the *Revue des Deux Mondes*], who has not always a clear style, writes to me that somebody came to see him and asked him to sound me in order to know if I would accept from the Emperor a compensation, offered in an honorable manner, and equivalent to the Academy's prize, in case this should not be given to me. I have answered that I desired absolutely nothing; but I have charged Buloz to present my refusal under the form of very sincere and very grateful thanks." She is afraid, however, that her answer may be twisted by the intermediary, and she charges Prince Napoleon, her friend, to make it for her in these terms: "I put no foolish pride, no party spirit, no shade of ingratitude in my refusal. If I were ill, infirm, and in a state of poverty, I would perhaps ask of him for myself what I have often asked of the Empress and the ministers for unfortunate people. But I am well, I work, and I have no needs." She ends by thanking the Emperor for the interest he manifests in her case. I note this incident in order to show well what the relations of Madame Sand with the Empire had become in 1861: the spirit of opposition was broken; she kept aloof, but she was no longer hostile; she even felt a very great friendship for Prince Napoleon. She called Princess Mathilde an "excellent Princess"; she was, indeed, not very far from Sainte-Beuve's state of mind, who had accepted the Second

Empire as a form of democracy, and who disliked all the statesmen who represented the "ancient parties," the Legitimacy and the constitutional monarchy of 1830. "Les extrêmes se touchent," says a French proverb: Napoleon I. had changed the surviving Jacobins into mute and obedient Senators; and even now I could find many Bonapartists of the Second Empire among the most ardent advocates and supporters of the Third Republic.

Maurice Sand joined Prince Napoleon in a journey which the latter made to Oran, Cadiz, Lisbon, and the United States. During his absence, his mother was working at her Memoirs, and organizing a small theatre at Nohant. She was tired of the great theatres and of the tyranny of the public, the directors, the press; she had her own plan of a free theatre, without any conventionalities, without any public, except a few sympathizing friends. It was a method for giving life and movement to her dreams—something much better than a novel, as a drama is life itself, without the tedious descriptions. The theatre of Nohant was, so to speak, the last fancy, the last passion of this imaginative and creative genius. Her attempt was, in one sense, successful, and in another sense it was vain. It was successful in so far as it procured her very great enjoyment, and peopled the solitude of her country house with the creatures of her fancy. It was vain inasmuch as nothing can live without rules. The theatre does not escape the general law. The public is a necessary element in all theatrical representations; the limitations imposed by the stage are also necessities; a drama must have a beginning and an end; it must obey a certain law of development. The dramatic faculty was not sufficiently developed in Madame Sand, and instead of trying to improve, she tried to escape from the rules of the dramatic art.

We find her becoming interested, while her son was in America, in Channing, in Emerson. She says of Emerson: "He is a philosopher, at the same time a critic, a metaphysician, a vast intelligence—a little obscured by too many divergent lights, but sublime; it is impossible to deny it." She studies Channing, and admires his doctrine. She does not accept everything. Channing says that "the individual is more than the state; that he is not made to devote himself, to sacrifice himself, to the state; that the state is made to devote itself to him, to protect him; the state is instituted to guarantee and to respect the rights of the individual." Mme. Sand sees egotism at the root of this doctrine. How, she asks, "can we all be free, absolutely speaking, if we are not all perfect?" "Be perfect," would answer Channing; "love each other." This seems to her an impossible ideal; she belongs instinctively to the school of Rousseau, who sinks the individual in the state. This doctrine leads to despotism in democracy, though Madame Sand would not have recognized it. She never fixed herself completely on any formula; she gathered her honey from all flowers. She writes to Dumas, *fils* (November 7, 1861):

"At your age, I was as tormented, as sick as you are, morally and physically. Tired of looking into myself and into others, I said one fine morning, 'This is all one to me. The universe is great and fine. What we think important is so fugitive that it is not worth while to think about it. There are only two or three true and serious things in life, and these things, so clear and so easy, are precisely the things which I have ignored and disdained, *mea culpa!* But I have been punished for my folly. I have suffered as much as it is possible to suffer. I ought to be pardoned. Let us make our peace with the good God.'"

She adds this: "If my pride had been incurable, it would have been all over with me; but I had what you have, the notion of good and of evil, a thing which is becoming rare in our time, and I did not adore myself, and I have forgotten myself." To forget one's self! Here we see Madame Sand come back to the morality of the 'Imitation of Christ.' Her religion was vague and undeveloped, but the little flame was always there under the cinders. When a child is born to her beloved son Maurice, she writes a very curious letter to M. Leblois, a Protestant minister of Strasbourg. Her son had been only civilly married, but when a boy was born to him, Maurice, Madame Sand, and the mother (probably the mother more than the two others) felt a sort of remorse. "We asked ourselves all three if the child could be educated in the vague religious aspirations which may be sufficient in the age of reason, or if we should not try, in order to prepare him to become a complete man, to attach him to a faith, idealistic, sentimental, and rational? But where are we to find a faith sufficiently formulated to be placed at the disposition of a child? We sought it in Protestantism, chiefly because it is a protest against the Roman tyranny." She then makes objections: there are things in the French Protestant Church which she cannot admit, but she has read his sermons, and she asks him to celebrate the religious marriage of her son Maurice, and to baptize her grandson. She puts questions, being ignorant of the Protestant world; she hopes his Church is not intolerant, at the same time she feels that something definite must be taught the child. She does not believe in very small churches: they are too narrow, too powerless; she wants something very large, very human, and at the same time very divine. The letter shows a singular ignorance of theological matters. The truth is, that Madame Sand had been educated as a Catholic. As, in politics, her ideal was the state above the individual, in religion, though she protested against Rome, and spoke of the Papacy with a singular horror, she had no other ideal than a *catholic* church, in the Greek sense of the word. She was a rebel, but wished to be a slave; she felt the impotence of her own nature, and longed for a rule.

Her letters to Prince Napoleon become very numerous in this fourth volume. We see in all of them this same tendency—social progress, political progress, must be forced on the people. The Prince is slowly assuming in her eyes the proportions of a Providence: she expects everything from him, as he is enlightened and progressive. She constantly warns him against priests and priestcraft. Her nature was flexible: she occasionally writes still a line to some old Republican friend, but had evidently lost all hope of a republic. She wanted now a substitute for it, a liberal empire. Prince Napoleon was her ideal Emperor. The fourth volume of this correspondence brings us to the end of 1864; the last years of the Second Empire and the war of 1870 will probably not be wanting in interest.

Correspondence.

A SAMPLE OF THE TARIFF.

To the Editor of The Nation:

Sir: Your readers may be interested in an extract from a letter just received from an American artist in France as follows:

"I heard from one of my friends, a very well-known painter here, on the jury of the Salon, who, writing to tell us of our fate in general, says: 'The two pictures by X—— have been received as No. 3. His large one richly merited a No. 2, but I could do nothing, and it fell to a 3. Why? I don't know. But the fact is, there is a strong feeling against the Americans—America has voted a law imposing a tax upon imported paintings by foreign artists of more than 33 per cent., which is practical prohibition, and is regarded in Paris as a veritable infamy. The Americans, and probably all foreigners (if the law is not changed at the next session of Congress), will be immediately expelled from all the private French studios, from the École des Beaux-Arts, and from the Salon. This is fully decided upon.'"

The American goes on to add: "What a shame to see our country, with a revenue so large that she does not know what to do with it, taking off the duties on rum and putting them on to Millet."

If we consider what an inestimable advantage these privileges give to our artists, the liberality with which the French Government has extended them, and the fact that even the retaliation is hardly worse for ourselves than the original provision, it makes one blush not so much for the country as for that which calls itself a government.

G. B.

Boston, April 14, 1883.

QUESTIONABLE ADVERTISING.

To the Editor of The Nation:

Sir: In Special Report No. 56 of the United States Department of Agriculture, pages 60-62, I find a contribution headed "Cincinnati, Indianapolis, Saint Louis and Chicago Railway, 'Kankakee Line,'" from the pen of Charles S. La Follette, the Western passenger agent of the line, and consisting of a description of the route and connections of the railway. The policy of special reports by persons outside the Department has, I believe, been productive of good results in some cases, and the railroads of this country are certainly an important factor in our agriculture; but I should be glad to have the views of some competent person as to the difference between this "special report" and a gratuitous advertisement by a department of the United States Government of one particular railroad.

Yours truly,

Inquirer.

Worcester, Mass., April 16, 1883.

THE STORY OF A PARDON.

To the Editor of The Nation:

Sir: An item is going the rounds of the press to the effect that one Samuel Ulum, a life convict in the Michigan State Prison at Jackson, after serving a term of twenty-eight years, has been pardoned out, *his innocence having been completely established.* As the death penalty was many years ago abolished in Michigan, and its reënactment therefore is sure some day to be, if not accomplished, at least agitated, cases like Ulum's will certainly be used in popular discussions as precedents. It may, therefore, be worth while to put on record the facts.

Although I am not specially conversant with the facts, I may say that the murder of which Ulum was convicted in 1855 occurred in our part of the State, and the trial was in our county. Moreover, it being the first murder that I remember, it has always had a peculiar hold on my imagination. On seeing this item in the newspapers, therefore, and among them newspapers so conservative as *Harper's Weekly*, I wrote to an uncle who was formerly a prison inspector, asking about the truth of the story. His reply, though not written for publication, is so brief, clear, and to the purpose, that it may interest others as it did me. He says:

"I do not understand there is anything new, positive or circumstantial, which has any bearing upon his (Ulum's) guilt or innocence. I think all the facts in the case were presented to Governor Bagley, and successively to Governors Crosswell and Jerome, which have now induced Governor Begole to grant the pardon. You will remember that Ulum was tried in our [Kalamazoo] county, on a change of venue from

St. Joseph County, after White, the accomplice, had been convicted in that county. They were convicted on the positive testimony of one Giles Harding (another accomplice), together with a chain of circumstantial evidence corroborating his testimony. Nothing has since occurred to throw any light on the matter, except that Harding, who also received a life sentence, and who died in prison many years ago, stated before his death that his testimony was false, and denied any knowledge of the murder whatever."

If this is the whole case, does it warrant the positive statement that his innocence has been completely established?

Yours very respectfully, MARCUS BAKER.

UNITED STATES MAGNETIC OBSERVATORY,
LOS ANGELES, CAL., April 6, 1883.

JESTING UNDER DIFFICULTIES.

TO THE EDITOR OF THE NATION:

SIR: Mr. W. F. Poole having made an onslaught upon me touching an inoffensive note in your columns, I must pray you of your courtesy to allow me a few words in answer.

My suggestion that convict labor should be employed in the manufacture of indexes was not altogether original, being a recommendation of Joseph Scaliger's. He, however, looked rather to the penal advantages, while I was chiefly moved by the wish to relieve many worthy persons of an humble, though certainly useful, drudgery, of which I can speak feelingly, having made indexes myself. Neither Mr. Poole nor his Index was at any time in my mind.

Mr. Poole, however, imagined that I was blaspheming both him and his book, and waxed exceeding wroth; apparently under the hallucination that no one can mention an index without thinking of his, and an uneasy suspicion that if any one laughs, he is probably laughing at him. This was all so absurd, that it was not in human nature to refrain from treating him to a little harmless persiflage; which seems to have irritated him to a quite extraordinary extent, as otherwise I am sure he would never have committed such a breach of literary good manners as to publish my name, and, what is worse, the private communications of a third person, without permission given in either case.

Mr. Poole compares me to an elephant. The elephant is a noble animal, and I do not disdain the comparison. But to that particular historical elephant who, pushing where he had no business, and, getting pricked with a needle, responded with a ferocious and unpleasant douche—it seems to me the counterpart might be found in another quarter.

However, Mr. Poole evidently suffers from hyperæsthesia, and his is a case for sympathy, not for smiles. It were inhuman to molest him further; and—since levity so offends him—I trust that in future his name and that of his Index will raise a general sadness whenever spoken. I am, sir, etc.,

WM. HAND BROWNE.

UNIVERSITY HONOR — NORTH AND SOUTH.

TO THE EDITOR OF THE NATION:

SIR: The method of conducting college examinations in some of our Southern colleges is so different from that of our Northern that doubtless most of your readers will be interested in it. At the University of Virginia, University of Georgia, and several others, the utmost freedom is allowed the student during his examination. There is no separating of them as in the North; there is no watching by the professors or proctors; permission is even given to them to leave the room, and in some instances they have been known to be absent for hours. At the University of Virginia the student attaches a pledge to his paper to the effect that he has neither given nor received aid during the examination. At some of the other colleges this pledge is not required. This is, briefly, the plan on which most of the college examinations in the South are conducted. So well has this plan worked that there is on record at the University of Virginia only one instance of a student cheating during the last twenty years, and, strange to say, he was from Indiana. He was detected consulting his books while out, not by members of the faculty, but by his fellow-students. The sentiment among his classmates was so strong at what they considered an outrage, that they immediately warned him that unless he left within so many hours, violence might be done to his person. There is an instance of a case similar to this that occurred at the University of Georgia. The accused was detected and expelled, not by the faculty, but by his own associates. Not long since the writer had occasion to call upon one of the professors in the University of Georgia, and, expecting to find him at the examination, was told that he had gone to the post-office at some distance. Upon meeting him and expressing some surprise that he should leave his class, his answer was: "Those men are gentlemen; they would not take advantage of my absence."

The sentiment is certainly very strong against cheating all through the South, and is in marked contrast with that which exists in our best Northern colleges. In the South they look upon a man who will cheat as a sneak-thief, whose very presence is an insult. In the North the prevalence of cheating is such that one might say that there exists hardly any sentiment against it. In the South it is the student that feels the insult. In the North it is the faculty that feel the wrong.

Is this not an instance where our Southern colleges are vastly superior to our Northern on the question of college morality and honor?

Yours respectfully,

GEO. A. PLIMPTON.

NEW YORK, April 13, 1883.

Notes.

MR. CHARLES H. MOORE is, we are glad to announce, shortly about to publish a series of "Examples for Elementary Practice in Delineation," for the use of schools and isolated beginners. It consists of reproductions of twenty examples drawn by himself, ten of them from historic works of art, and ten from nature; and of about a dozen pages of explanatory letterpress. The object of this series is, while training the eye and hand to accuracy and precision, to cultivate perception of those characteristics of line upon which all expression of living character and beauty depends. This object is, so far as we know, neither clearly contemplated nor successfully attained by any drawing copies now in use in our schools. The publisher of Mr. Moore's present work is Moses King, Cambridge, as also of his admirable "Facsimiles of Examples in Delineation," a companion series for more advanced students, brought out last summer.

G. P. Putnam's Sons will publish in May the first two volumes of a monthly "series of representative essays" called "Topics of the Time," to be issued both in paper and in cloth. The editor will be Dr. Titus Munson Coan, and the arrangement of the essays will be such as to make each volume homogeneous. Thus, the two initial ones will be devoted to "Studies in Biography" and "Social Problems."

E. P. Dutton & Co. announce that while they will abridge the three volumes of the 'Life of Bishop Wilberforce' which they are now reprinting—omitting much that would possess little interest for the American reader—they will scrupulously retain the portions of the third volume which have caused such a hubbub across the water.

The 'Life of George Eliot,' now in preparation by her husband, Mr. Cross, will be published in this country by J. R. Osgood & Co.

T. Whittaker will print an American edition of H. L. Sidney Lear's 'Five Minutes' Daily Readings of Poetry,' by friendly arrangement with Houghton, Mifflin & Co. as respects certain copyrighted selections from Longfellow.

Van Epps & Co., Cleveland, Ohio, have nearly ready 'The Resources of the Rocky Mountains,' an illustrated handbook by E. J. Farmer.

Harper & Brothers announce 'The Cruise of the Canoe Club,' by W. L. Alden.

In response to the Messrs. Harper's cheap *lex talionis* edition of the 'Letters and Memorials of Jane Welsh Carlyle,' Charles Scribner's Sons will publish at once, in a single volume, a new and cheaper edition than their library edition already issued in two octavo volumes. It will be printed from the same plates, on good paper, and will contain an etched portrait of Mrs. Carlyle.

Edward Stern & Co., Philadelphia, will shortly publish 'The Jews in Philadelphia prior to 1800,' by Mr. Hyman Polock Rosenbach. The edition will be limited to 250 large-paper copies.

Mrs. Lillie Devereux Blake's recent lectures in reply to the Rev. Dr. Morgan Dix will be immediately issued, under the title of 'Woman's Place To-day,' by John W. Lovell Co.

It marks the change in the relation of the sexes in this country that Mrs. Martha J. Lamb is to assume, with the May number, the editorial direction of the *Magazine of American History*, in place of the retiring editors. The want of stability hitherto in the conduct of this periodical will, we understand, disappear under the new proprietorship.

Mr. Appleton P. C. Griffin, of the Boston Public Library, proposes to reprint as a large pamphlet, in a limited edition, his two articles on the bibliography of the discovery of the Mississippi, published in the March and April numbers of the *Magazine of American History*. It will contain a facsimile of Joliet's map of 1674. The price will be seventy-five cents a copy.

The *Evening Post* Association, of Hartford, has issued its annual quarto volume of 'Biographical Sketches of the State Officers, Representatives in Congress, Governor's Staff, and Senators and Members of the General Assembly of the State of Connecticut,' for 1883, with portraits. Such a collection of lives and faces affords a very interesting study of politics and character. Disciples of Lavater may amuse themselves by guessing the party of each member of this portrait gallery from his physiognomy.

We regret the withdrawal from the book trade of the veteran Mr. Alexander Williams, of Boston, whose imprint has lately been attached to literary ventures rather bespeaking a revival of enterprise in the firm. Cupples, Upham & Co. will succeed A. Williams & Co. in the "Old Corner Bookstore"

The fourth number of the *Folk-Lore Journal* (London: Elliot Stock) contains an index to the folk-lore, etc., of Horace, without giving the actual quotations. The same thing done for Virgil would be a more serious undertaking, but very serviceable.

We have received from L. W. Schmidt, 7 Barclay Street, Parts 56-60, completing the fourth volume of 'Brockhaus' Conversations-Lexikon' (13th ed.) with the title *Deichselrecht*. The full-

page illustrations relate entirely to steam in its various applications, and accompany the longest connected series of articles in the above instalment of the Lexikon. The 32 pages devoted to this subject close with a very useful table of European steamship lines, classed according to their destination, with days' length of trip noted, and of the principal foreign lines. The other most prominent articles are Cuba, Czech law, languages, literature, etc., Denmark, Dante, and Darwin and Darwinism. American biographies include Caleb Cushing, Charlotte Cushman, R. H. Dana, sr. and jr., and Jefferson Davis, whose ponderous and disappointing 'Rise and Fall of the Confederate Government' is dryly described as "a very comprehensive but pretty empty (*inhaltslosen*) work." The colored maps show the international steamship tracks, and (in one plate) Denmark, Sweden, and Iceland. Custozza, Danzig, and the Dardanelles are charted in the text.

The *Bibliographer* for April (J. W. Bouton) is very true to its name; the Bibliography of Skating is continued, that of Sacheverell begun. Mr. Cornelius Walford, also, uncrushed by his 'Insurance Cyclopædia,' offers the first part of a tremendous scheme for a Dictionary of Periodical Literature. In the meantime, the *Publishers' Weekly* of this city is able to announce the success of arrangements to carry out Messrs. Poole & Fletcher's plan of annual coöperative indexing of periodicals, both those already included in 'Poole's Index' and others. The first volume will cover the years 1882–83, after which the issues will be strictly annual. The public has nothing to do with these, which are the affair of the coöperating and subscribing libraries, but every five years there will be made from them a Supplement to the great Index, which will be for sale.

On the other hand, a scheme of Mr. W. K. Stetson's, assistant librarian at Wesleyan University, will be carried out in the *Library Journal*. This is the indexing of current periodicals from month to month, as they appear, and the printing of the entries in such a manner as to make them available for card catalogues. The same rules will be observed as in 'Poole's Index.' In view of this undertaking, and of the added support which it ought to secure from the public at large for the *Library Journal*, we can hardly welcome a projected monthly *Index*, to be published at Lawrence, Kansas, by Prof. James H. Canfield, of the State University. From the specimen page it is clear, as might have been expected, that the character of the indexing will fall far below that which the coöperating libraries will employ.

We have often been amused by unlucky translators who have rendered *librairie* (bookselling) by library. Now we find *Polybiblion* saying that the *Société américaine de Librairie* (by which it means the American Library Association) commissioned Mr. W. Poole to prepare a third edition of his 'Index to Periodical Literature.'

Part 3 of the third volume of the Proceedings of the Davenport (Iowa) Academy of Natural Sciences is entirely given up to a commemoration of the late President of that body, Joseph Duncan Putnam, a young entomologist of indefatigable industry and great promise, and the most useful member the Academy has ever had. The pamphlet contains a portrait, numerous obituary sketches and condolences, and an unpublished paper on the Solpugidæ, with bibliography and illustrations, by the deceased naturalist. To this spider-scorpion family he had given more attention than any one else. On the paternal side, Mr. Putnam was, as his name implies, of Eastern descent, reckoning common ancestors with General Israel Putuam, General Daniel Morgan, and President Holyoke, of Harvard; on his mother's he was descended from the same stock (Caldwell) as John C. Calhoun.

Mr. Samuel H. Scudder's 'Pine Moth of Nantucket' (Boston: A. Williams & Co.), one of the publications of the Massachusetts Society for the Promotion of Agriculture, tells a curious story of the invasion of the trees of that sparsely wooded island by the Retinia frustrana. Their attack is deadly, and can only be met by heroic treatment—"by breaking or cutting from every pine tree on the island every affected shoot" during the month of June. The conditions for concerted action on the part of an isolated population holding much of their lands in common would seem favorable, but Mr. Scudder despairs of seeing his "ten men, each armed with a pair of hedge shears, and ladders of some sort." The enemy is beautifully figured in colors.

The Woman's Education Association has again enabled the Boston Society of Natural History to open the Seaside Laboratory at Annisquam, Mass., from July 1 to September 1, 1883. This will make the third summer of the institution, which those are qualified to profit by who have had some experience in a laboratory, or attended practical lessons, or have taught in the schools. The Curator of the Boston Society, Mr. Alpheus Hyatt, will answer inquiries by applicants as to terms, etc.

Dr. Samuel A. Green, who has done so much to illustrate the history of the town of Groton, Mass., has just published a brochure on 'Groton in the Witchcraft Times.' The chief matter and interest of it consist in an independent transcription of the before-printed account left by the Rev. Samuel Willard of a supposed case of demoniacal possession in the year 1671, famous in Puritan annals as the case of Elizabeth Knapp. This clerical relation is in style an excellent production, and in its revelations of contemporary superstition a most instructive document. The unfortunate victim of hysteria often had her tongue "turned up circularly to the roofe of her mouth"; but, by means of a devilish ventriloquism, "the labial letters, divers of which were used by her, viz., B. M. P. which cannot bee naturally expressed without motion of the lips, which must needs come within our ken, if observed, were uttered without any such motion," etc.

According to *La Réforme Sociale*, the law against duelling lately defeated in the French Senate was the seventh abortive attempt since the code of 1810. The measure had no provision for the suppression of duelling in the army, where it is almost obligatory. Nevertheless, says *La Réforme*, the number of duels in France is steadily diminishing.

The ever-enjoyable "Voyage de M. Perrichon" of MM. Eugène Labiche and Édouard Martin forms No. 1 of "a series of the best modern and standard French plays, carefully selected for their unobjectionable character, each one recommended by teachers in the language, and suitable alike for school or general reading," which is to be issued by W. R. Jenkins under the title of the 'Théâtre Contemporain.' From this announcement it is evident that the 'Théâtre Contemporain' is to follow the lines of the excellent series of "College Plays" edited by Prof. Bôcher. It is to differ from them in the omission of all notes, grammatical or otherwise. The new series contains absolutely nothing but the text of modern French plays. It is proposed to issue twelve a year. No better choice for beginning the series could have been made than Labiche's "Voyage de M. Perrichon," which is perhaps the best bit of pure farce, founded on deep observation, in the French drama of this century. It is to be followed by the "Gendre de M. Poirier" of Augier and Sandeau, the "Duc Job" of Laya, "Bertrand et Raton" and the "Verre d'Eau" of Scribe, all of which are excellent selections, and by a double number containing the "Soupière" of M. d'Hervilly (whose clever but tortured style is not a good model for students) and "Sa Canne et son Chapeau" of the Comte W. Sollohub, which is altogether unworthy of reproduction in America, and indeed unfit for general reading here, as the fundamental idea is neither commendable nor cleanly.

Of making many reviews there is no end. One of the latest has the singular title, "*Le Règne de Jésus-Christ*, revue illustrée du musée et de la bibliothèque eucharistiques de Paray-le-Monial." From the first number it appears to be devoted chiefly to Christian archæology. *Polybiblion*, in which we find this noticed, also records the foundation of the *Revue du Monde Latin*, a monthly devoted to the interests of the Latin races, material, intellectual, and moral, and intended to pave the way to their permanent union. It is to be issued in five editions—French, Spanish, Italian, Portuguese, and Rumanian. These editions will differ solely in the language of the first sixteen pages, the monthly political and diplomatic bulletin. The rest of each number will be generally in French, or, if there is an article in any other language, it will be accompanied by a French translation. Our list of oddities finds an appropriate ending in *Croque-Mort*, a new journal which is to have its readers, and, what is more important, its advertisers, among the undertakers, coffin-makers, dead-watchers, grave-diggers, and mourning-milliners.

—The book-sales of the present season in New York will be memorable for the large contingent furnished by the State of Rhode Island. We have already had the poorest part of the unregulated collection of the late Joseph J. Cooke, of Providence, and the library of the late David King, of Newport, perhaps also only in part; and now the Messrs. Leavitt will sell at auction, on April 30 and the following days, a first-rate sample of the collection of the late Mr. C. Fiske Harris, of Providence, which far outranks the others just named. The catalogue shows that the special line selected for disposal, and which embraces a decided plurality of the 2,569 titles, is early English poetry and drama, in choice and early editions. Shakspere is represented by the first four folios, uniformly bound and in exceptionally fine condition; as well as otherwise. Of Spenser there is the first edition of the 'Faerie Queene' printed under the poet's care, 1590-96; of Waller, the first edition of his 'Poems,' 1645; of Milton, the first edition of his 'Defensio' against Salmasius, 1651, and of his 'Paradise Lost,' 1669, and of his 'Poems' bearing his name on the title-page, 1643; of Thomson, the 1736 edition of his poetical works, with several autographs of the poet and his sisters superadded. The collection of Drydens is also noticeable for its numbers, and there are several tempting volumes of miscellaneous poems. The books on or illustrating early printing are comparatively few, and do not reveal the strength of the collection on this side. Still, there are some Dutch "Fifteeners" bound up in No. 1841, and No. 1312* is ascribed to the same epoch and nation; No. 1208* is the Aldine edition of the 'Hypnerotomachia Poliphili,' 1499, and there is besides a French translation of the same work, 1554. Finally, we must mention a French version of Boccaccio's 'De Genealogia Deorum,' 1498. Several manuscripts on vellum, of the thirteenth, fourteenth, and sixteenth centuries, are beautiful of their kind. We can barely name further 'The Pleasauntest Workes of George Gascoigne,' 1587, once Thomas Warton's, by gift of Bishop Warburton; 'Ferdinandi Cortesii Narratio,' 1524; and John Eliot's Indian Bible and

New Testament, the latter imperfect, in one volume.

—A handful of correlated manuals come to us from F. Leypoldt, for which we bespeak the widest possible circulation. One is a collection of short essays and familiar lectures by Mr. W. E. Foster, of the Providence (R. I.) Public Library, for which a general title, 'Libraries and Readers,' has been found. Another is a volume of about the same size, the work of several hands, Mr. Foster included, called 'Libraries and Schools'; Mr. Samuel S. Green, of the Worcester (Mass.) Free Library, being of right the editor. A third is 'Books for the Young,' by Miss C. M. Hewins, of the Hartford (Conn.) Library Association. A catalogue, not published by Mr. Leypoldt, nor for sale, of the library of the Point Street Grammar School in Providence has a close relation to each of the foregoing publications, and may properly be mentioned in connection with them. Mr. Foster's discourses are the outgrowth of his experience in meeting the needs of the actual, and enlisting the interest of the natural, patrons of his library. No one, with limited resources, has done more to turn to account the collection under his charge, or shown greater activity and ingenuity in devising ways and means to stimulate reading, study, and research, and guide them in the proper direction. His chapters are valuable as exhibiting phase after phase of his perception of the conditions under which public libraries are now used, and found to be of service, by widely differing classes of the community. They are all sound, practical, and suggestive, and will benefit parents, their elder children, and the author's fellow-librarians about equally. They treat of the following topics: Right Reading; Correction of Aimless Reading; Specializing of Reading; "Current Literature," and "Standard Literature"; Securing the Interest of a Community; What May be Done at Home; How to Use a Library; Books and Articles on Reading.

—The second volume on our list bears wholly upon the best method of making the public library a component part of the common-school system. It opens with Mr. C. F. Adams, jr.'s, frank address to the Quincy teachers in 1876, and notably contains, besides, a full account by Mr. Green of his success in Worcester in establishing the coveted alliance, and two papers by Mr. Foster upon the general theme. Some of the methods advocated or proposed by the several writers invite criticism, but librarians and teachers everywhere who consult this little volume will close it with a sense of indebtedness. Reference is made in the last chapter to the library gathered for a Providence grammar school. The catalogue already mentioned shows that there is, as there should be, a pupils' and a teachers' collection, the former being regarded as a sort of "branch" of the public library, with the advantage of the most careful censorship in its formation The discipline which it is made to yield to the pupils is set forth on pp. 120–123 of 'Libraries and Schools,' and no one can read Principal Sawin's scheme without feeling that it embodies a new and fruitful idea. Miss Hewins's classified list of suitable books for the young deserves more extended praise than we have space for. It will bring joy to the hearts of hundreds of parents, whose confidence in the compiler's judgment will be assured by her prefatory remarks and directions, and her choice extracts from divers authorities on the true aim and criterion of juvenile literature. One more volume remains to be written, in behalf of the cultivation of a refined and elevated taste either through a reform in text-books, particularly in readers, or through early memorizing, even occasionally past comprehension, of noble passages in prose and verse from the great English classics.

—The last two numbers of the *American Journal of Philology* contain articles by Mr. Fitzedward Hall which impress the reader anew with the extraordinary scope of this writer's explorations in the field of English literature. They do more than this, for they inevitably suggest the desirability of Mr. Hall's annotations being utilized for some work of permanent authority, like a grammar or a dictionary. In his first paper (Vol. iii., No. 11) he is concerned with an idiom which it is safe to say not one Anglo-Saxon in ten thousand has ever regarded by itself—"The English Perfect Participle used Infinitively." The text is furnished by a singular passage from Thomas Fuller—"At this time *began* the troubles in the Low Countreys, about matters of religion, *heightned* between two opposite parties," etc. The various forms in which this idiom lurks will prove a revelation to those who follow Mr. Hall through the labyrinth of illustrations with which his footnotes are charged. The second paper (Vol. iii., No. 12), "On Some Points of Usage in English," is more varied, because it is a criticism on Professor Short's late articles in the *Journal* on the Revised New Testament. Thus it establishes against his dictum the frequency of the use of a singular verb with a compound subject in modern English, and concludes that the only restriction which good usage imposes, forbids either plural substantives and pronouns, or a plural and a singular, to be nominative to a verb in the singular. Another vindication is of "moth and rust *doth* corrupt" as a survival of a plural form, which the Jacobean revisers tolerated (by exception in this text) for euphony's sake. We have not mentioned all the points in Mr. Hall's comments on Professor Short, but these are the most important.

—In a reference made by the *Revue Politique* to the Reports or Proceedings of the Société Archéologique, of Constantine, it appears that there are at least twenty volumes, and that a general index has just been published. The antiquities in the neighborhood of Constantine are rich and often important. Not long since, the Society opened a *lararium* near Tebessa, in which were mingled Roman and Numidian idols which had found a refuge there when the temple of Minerva, at Theveste, was taken possession of by the Archbishop Aurelius, 399 A. D. The most noteworthy find, giving a glimpse of the difficulties of life at that day, was a fragment of a god evidently representing Apollo, and yet recalling the type of Christ found in the Catacombs. The probable explanation is, that a Christian sculptor had taken an order from a Roman priest, just as idols for India and Africa have been and perhaps are now manufactured at Birmingham. This is not quite according to our ideal of the early Christians; but the early Christians were not all saints—there were the *lapsi*. Besides, they had to live together, Pagans and Christians, and it could not have been easy always to determine just what was lawful commerce, just what criminal compliance with heathen customs.

—Among the clerical contributions to the literature of the Salvation Army, M. E. de Pressensé's "L'Armée du Salut" in the *Revue Politique et Littéraire*, and Dr. R. Schramm's 'Das Heer der Seligmacher' ("Deutsche Zeit- und Streit-Fragen," Berlin, Carl Habel) claim especial attention. M. de Pressensé's article, while brief, is as outspoken in its condemnation of the movement, from an intellectual as well as a purely religious point of view, as Dr. Schramm's exhaustive essay. "Taken all in all," M. de Pressensé says, "one can but see in this movement a dangerous deviation both from the principles of Christianity and the reform of the sixteenth century." The ways of the Salvation Army are those of Loyola's disciples and the flagellants; he speaks of its "prearranged" enthusiasm, of neophytes drilled into giving "testimonials," of "the almost total suppression of the activity of the mind" characteristic of every English "revival," with its sudden "improvisation de la conscience." "What the Salvation Army has developed to a boundless extent is *humbug*, the unbridled charlatanism which chooses any means to excite attention, nay, to provoke scandal, in order to agitate and inflame minds. General Booth may well give a few points to Barnum." M. de Pressensé, however, deprecates the illiberality of the Swiss cantonal governments in their treatment of the Salvationists, which ended in making martyrs of them. He proposes, as the best way of dealing with them, "the cold-shower-bath of public indifference," which will speedily lead to the disappearance of the "insanity and fanaticism that enter largely into every movement like that of the Salvation Army." Dr. Schramm, who is preacher at the cathedral of Bremen, acknowledges, as does also M. de Pressensé, that the Salvation Army has achieved some practical good among masses which perhaps can only be reached by such methods as it employs. He shows a thorough knowledge of English society, which, as he well says, is necessary in order to enable Germans to understand the movement at all. "In Germany, the only agitation remotely resembling it in its methods is that headed by the court-preacher Stöcker." Dr. Schramm has personally attended the meetings of the Salvationists in England; he has observed their actions and the behavior of their audiences with a keen eye, and describes what he heard and saw with a graphic pen—their confessions and conversions, their hymns, tracts, and "war-cries." He is familiar with all the details of his subject, and discusses it in a spirit of singular fair-mindedness. Yet he, too, comes to the conclusion that the activity of the Salvation Army "exposes Christianity to the laughter and ridicule of the civilized world; . . . that these men do their best to widen the chasm between Christianity and modern culture, between religion and enlightenment, between piety and knowledge." These opinions of two foreign Protestant clergymen of such prominence are well calculated to make an impression on those of the English clergy who, while objecting to the methods of the Salvation Army, have lavished encouragement on it for the sake of its aims.

—Not long ago we called attention to the inaugural address of Professor Butcher, at Edinburgh. At least equally noteworthy, though for different reasons, is the inaugural address delivered by Dr. H. Usener, last October, on assuming the rectorate of the University of Bonn, which has been published in pamphlet form. Under the title 'Philologie und Geschichtswissenschaft,' Dr. Usener discusses the place of philology in science. In a brief preface he disclaims all intention of saying new things: he only wishes to give a public statement of what many must have thought and felt about the present relations of philology to other studies, and the exact view which must be taken of the purposes of philology at the present stage of the development of studies. This statement is given in a very clear and simple way, though the analysis on which it rests is both acute and profound. A brief quotation from the last page will give a hint of the spirit of the work:

"We Germans are not likely to forget, nor do we wish to forget, that it was a masterpiece of creative power in reproducing antique life which laid the foundation of our philology; and the

more we subdivide our work, the more securely shall we fix our eyes upon the goal which Wolf and Boeckh pointed out. The philologian has been and is and will continue to be the pioneer of scientific history."

—Everybody knows that even a great artist like Rubinstein does not always play equally well. A muggy day, a bad dinner, a temporary emotional excitement, may frustrate his best intentions, whereas the coexistence of the opposite conditions will enable him to play on the nerves of the audience with the same certain effect with which a violinist's strings respond to the touch of his bow. With a large body of instrumentalists and singers it is still more necessary that the circumstances should be favorable to secure good work. This was the case at the Wagner Memorial Concert given at Steinway Hall on Saturday. The atmosphere was clear and bracing, which enabled the strings to develop their fullest resonance; the audience was very large and eager, which helped to inspire the performers; Mr. Thomas was full of personal magnetism, which communicated itself to his musicians and the audience alike; and, finally, Steinway Hall is acoustically so superior to the Academy of Music that the Philharmonic Orchestra, which forms part of the Chorus Society, could be heard to the best advantage. The result was a concert to be remembered a lifetime. We have heard all the best orchestras in Europe; but, after Saturday's experience, the conviction forced itself on our mind that the Philharmonic is absolutely the best in the world, and that a more able conductor than Mr. Thomas cannot be found. Unqualified praise cannot be bestowed on the chorus as a whole, for it is impossible to get a sufficient number of good tenors to secure such an evenly-balanced ensemble as the orchestra's. Except in point of weakness, however, no fault was to be found with the tenors on this occasion; and as for the female chorus, we know what we are talking about when we say it is one of the finest in existence, producing a tone of rare resonance and sensuous beauty. The chorus of sirens and that following the march in "Tannhäuser," as well as the finale from the "Meistersinger," were sung with a vigorous accent and full body of tone that excited the audience to the highest pitch of enthusiasm, and induced them, instead of leaving immediately at the end, to remain and tumultuously call out Mr. Thomas with applause, bravos, and waving of handkerchiefs.

—There were three preludes on the programme —"Tannhäuser," "Parsifal," and "Meistersinger"—together with "Siegfried's Death," from "Götterdämmerung," all of which the orchestra played in such a way as to reveal the minutest detail of the polyphonic interweaving of motives, and to show the warm, rich, and ever-changing colors in the most brilliant light. The "Bacchanale," from "Tannhäuser," which had not been played in this city for some years, probably proved *haut-goût* for a large part of the audience, while to the epicure it always seems delicious. It is perhaps the most tumultuous, dissonant, and delirious composition ever written, but when it is heard while the eyes behold a wild dance of bacchantes on the stage, with Cupids hovering in the air and shooting arrows at them, nothing could appear more appropriate. It was not in "Tannhäuser" as originally written, but was added by Wagner when that opera was to be produced in Paris, in place of the necessary ballet in the second act. He refused to put a regular ballet in the second act, and this incensed the Jockey Club, and caused the fiasco of the opera which led to such a long quarrel between France and Wagner. The music belongs to the "Tristan" period, and the striking harmonic resemblance to the love-motive in that drama suggests a subtle psychological nexus which we have not space to do more than hint at here. With the dramatic and scenic background of the flower-garden scene and the finale of the third act of "Parsifal" readers of this journal are already familiar. The flower-girls sang beautifully, although the solo parts were somewhat weak; and the same remark applies to the quintet from "Die Meistersinger," which followed Pogner's Address (Herr Remmertz). The "Parsifal" finale may have proved tiresome to a few of those to whom the music was entirely new: but if they will reserve judgment until they have heard it again, they will find that it belongs to the very best Wagner has written. Indeed, so finely were its beauties revealed on Saturday—the performance being actually better than at Bayreuth, so far as the orchestra was concerned—that we felt for the moment as if this, Wagner's Swan-song, was the best thing he had ever composed. The short funeral march, in its monotonous grandeur, has the effect of an exaggerated minor, on account of the shrill discords and the lugubrious meanderings of the bass.

—Mr. Thomas, by the way, has added to his numerous other achievements in behalf of good music the distinction of having invented a new instrument of such exquisite timbre that it will doubtless at no distant time become a part of the necessary outfit of every first-class orchestra. It will be remembered that at Bayreuth considerable trouble was occasioned by the difficulty of securing an instrument to execute the four notes of the bell-motive in the finales of the first and third acts. Actual bells, besides being too expensive, were not available, on account of the harsh, dissonant overtones which always accompany their proper tone. Hans Richter's "bell-piano," which contained four thick strings consisting each of several ordinary strings twisted into one, did not prove a success; and the tam-tams substituted for them did not indicate the pitch with sufficient distinctness. In place of these Mr. Thomas conceived the happy idea of getting four steel bars of different thicknesses, which are carefully tuned, and, on being struck with a wooden hammer, give forth a silvery sound as free from overtones at a distance as tuning forks, and strikingly suggestive in their sound of actual cathedral chimes.

LIDDELL AND SCOTT.

A Greek-English Lexicon. Compiled by Henry George Liddell, D.D., Dean of Christ Church, Oxford, and Robert Scott, D.D., Dean of Rochester, late Master of Balliol College, Oxford. Seventh Edition, Revised and Augmented throughout, with the coöperation of Professor Drisler, of Columbia College, New York. New York: Harper & Bros. 1883.

THE late Charles Astor Bristed, in his interesting account of 'Five Years at an English University,' refers to the Greek Lexicon of Liddell and Scott as a worthy monument of the classical learning of Oxford. This is doubtless a just appreciation. To be sure, such a work would ill bear comparison with the monumental achievements of the University of Berlin, working in the name of the Berlin Academy; but if we ask what have been the large and serviceable gifts of the other universities of the world to Greek scholarship, we must admit that Oxford has no reason to be ashamed of this lexicon. To judge fairly of the service rendered, we must ask ourselves how we should like to go back to Donnegan or Schrevelius. It is not in England alone, of course, that advances have been made in lexicography; and Liddell and Scott owe very much of what is good in their work to their German predecessors and contemporaries, almost all that is trustworthy about verb-forms to Dr. Veitch, of Edinburgh, and now not a little of special value to three American scholars. Still, the book is an Oxford book, true to its origin in its merits and in its defects; and when all allowances have been made, it must be confessed that the University of Oxford has bestowed upon English-speaking scholars very decidedly the best Greek lexicon for constant service now in use in the world.

The present, seventh, edition naturally invites comparison with the third edition of Pape's 'Griechisch-Deutsches Handwörterbuch' (1880). Without disparaging the great merits of Pape and his editors, we cannot hesitate to say that Liddell and Scott have succeeded in making a more useful book. The superiority is due chiefly, it is true, to greater skill in mechanical arrangement, in the use of types and such matters—to a better practical sense of ways in which time may be saved and vexations avoided for those who seek information; but in such a book such a superiority deserves high recognition. Pape invites the student, in his examination of a troublesome word, to wander in a chaos where nothing guides his eye, until he stumbles upon something to satisfy his need. Liddell and Scott make it possible for him to find instantly whatever information they may have for him: the whole machinery of divisions and subdivisions and guiding numbers and letters is admirable. It may be possible to quarrel with a classification sometimes on scientific grounds, seldom indeed on grounds of practical usefulness. So far, too, as we have been able to examine, the English book is very much the more correctly printed of the two. In point of learning and soundness of views, Pape may possibly have a slight advantage. For some reason, most dictionaries keep somewhat behind their time, and the new edition of Pape is no exception. The two volumes of Pape (leaving the separate volume with the proper names out of account) give about one-tenth more square inches of printed paper than the one volume of Liddell and Scott, and, as Pape is more closely printed, it may contain about one-eighth more matter. In the main, there is little difference in fulness of treatment, but Pape gives very much more copious discussions and examples of difficult words in frequent use. The space given to ἄν is seventeen times as great in Pape as in Liddell and Scott, to μή nearly three times as great, to ἐπί rather less than twice as great. But it is in such articles as these, above all others, that we are thankful for the clear arrangement of Liddell and Scott. There are other differences of proportion. Under the editing of Sengebusch, Pape's lexicon has acquired a disproportionate number of citations from Homer; it is a merit of Liddell and Scott that they are comparatively free from such partialities.

The seventh edition of Liddell and Scott, compared with the sixth, shows an increase in space of printed paper of nearly five per cent. The number of pages is diminished, but their height is considerably increased. The preface tells us that the matter contained in the sixth edition has been considerably compressed: "the additions consist mainly of fuller references to the classical authors, and a free use of the *Indices* to the Berlin Aristotle and to the *Corpus Inscriptionum Græcarum*." These additions greatly increase the usefulness of the book. The references to the authors might with advantage be made still fuller. A teacher often needs an example of some familiar usage which it may cost him a long search to find; students should be carefully trained to feel the same want. It is not enough for teacher or student to be told

that a word is used in a certain sense in Attic writers—the teacher needs to show, and the student needs to see, actual specimens of the usage. The old dictionary tells us that αἱρεῖν means to "get into one's power, conquer, πόλιν, ναῦς, Il. 2, 37, 13, 42. and Att." The new edition says: to "get into one's power, ναῦς, Il. 13, 42; esp. to take a city, 2, 37, Soph. Ph. 347, etc.; cf. ἄκρα." This is a gain; but a few examples from Attic prose-writers would still be a gain. In both editions alike we are told that αἱρεῖσθαί τινα, ἄρχοντα, στρατηγόν, is "freq. in Att."; but no example is given. The whole number of references under αἱρέω is seventy-one in the old edition, and ninety-one in the new. The new words from Aristotle are very welcome. The earlier editions did nearly nothing for readers of Aristotle—even the 'Ethics' and 'Politics' received but slight attention. Some advantage in dealing with philosophical terms might have been gained from a use of the index to Diels's 'Doxographi Græci,' though it would not have added any great number of words to the dictionary—only eight beginning with α. For another set of technical terms, Fabricius's 'De Architectura Græca Commentationes Epigraphicæ' came too late. The maker of the next new dictionary will find there thirty words hitherto unregistered (thirty-two not in Pape), besides valuable explanations of other words important to the student of architecture or archæology. But it cannot be said that similar unused sources abound. The dictionaries have generally absorbed the indexes. Careful reading of the authors must be the chief means in the future for the collection of omitted words and neglected turns of meaning. It is very strange that the fragments of the lyric poets have never yet been properly read for this purpose. Many of them, surely, ought to be made as intelligible as possible to all students. They present great difficulties to the lexicographer; but everybody would be glad to see the forms of Bergk's text registered, with some fairly reasonable explanation in each case. Within the first six lines of the famous first fragment of Sappho is a word for which this seventh edition of Liddell and Scott may be searched in vain.

But how shall space be found for further additions? This new edition has certainly reached the extreme limit of size permissible in a book intended for the general use of students—indeed, that limit was reached in the sixth edition. But we believe much may be done by still more rigid compression, by greater skill in the use of abbreviations, by the exclusion of all words whose value is purely lexicographical. This latter class of words, to be sure, must be within the reach of the scholar, but the young man trying to learn the language is only hindered by them. Three Greek dictionaries are needed, we believe: a small and handy one for beginners, having regard only to some few of the easier authors, containing, among other things, all the proper names in those authors; next, a book like the large Liddell and Scott, with the omissions suggested; finally, a sort of index to all dictionaries, including Hesychius and the rest. This last, if made on a proper plan, would be indispensable to all teachers and investigators, but young students need not be troubled with it.

The tact and good taste of the interpretations of Liddell and Scott are well known. The difficult passages of the authors most read have been considered, nearly or quite without exception, and sensible explanations given under the important words. Inaccuracy and inadequacy may sometimes be fairly charged against the explanations; but their general quality is nevertheless very excellent, showing distinct superiority over other Greek dictionaries. The etymologies have never been the strong point of the dictionaries. We incline to think Liddell and Scott more successful than others even here; but we wish the etymological notes had been written by a specialist. Liddell and Scott have made conscientious use of the text-books of Pott, Curtius, and others; but specialists they are not. For example, under κομιδῇ occurs the note: "Prob. from √ KOMIΔ, the *y* being lost in κομιδή, and *δy* becoming *ζ* in κομίζω." No specialist could have let that pass; and, so long as there are specialists whose services may be had, it is hardly excusable to put such statements before students. By the way, it seems wasteful to use both capital letters and the radical sign to designate roots.

We may give a few more specimens of fault-finding of various kinds. For exclamatory ἄ, ἆ, etc., there are only two entries. No mention is made of ἀά, nor of ἀᾶ. For ἄ ἄ ἄ, Eur. Cycl. 157, the repeated long breath of content after a satisfying swig, we have the misprint (or ill-advised emendation) ἆ ἆ, and are told it is a laugh. Under ἄλλως there is no adequate account of the meaning *foolishly, unreasonably*, so common in Plato. The interpretation of Soph. Ant. 455, given under ὑπερτρέχω, cannot stand—ὑπερτρέχω means *outrun;* it is ὑπερβαίνω that means *overstep.* Under ὑπίλλω we find the citation of Soph. Ant. 505, εἰ μὴ γλῶσσαν ἐγκλείσοι φόβος—a sort of grammar, fortunately, not to be found in that edition of Sophocles which Liddell and Scott tell us they have chiefly used. Under ναῦλον nothing is said of the meaning *house-rent.* The orators are still cited by the pages of Stephens and Reiske—a fashion long since out of date. Students seldom or never find such citations manageable. Under σώζω we find the statement, surely inadequate, "or with ι subscr. whenever ζ precedes ω"; while of θνῄσκω and other similar forms no mention is made. But there is little use in enumerating such flaws unless it be done for the good of future editions. Liddell and Scott tell us they cannot hope to see another edition issued in their lifetime, and our first duty is to thank them for what they have done.

We feel a certain hesitation in speaking at all of the contributions which American scholars have made to this edition—and we shall not speak of them in detail. Besides Dr. Drisler, whose name is on the title-page, Dr. Goodwin and Dr. Gildersleeve are named in the preface. It is no secret that one of these scholars has "protested against the unfair and inconsiderate manner in which his work has been treated." It may be that in many particulars these contributions fall short of the excellence which their authors wished and tried to give them. It is enough for our purpose to say that the articles on ἄν and on μή, to specify these examples, show an incontestable and very great superiority to the corresponding articles in the sixth edition. Very probably the editors have been unwilling to concede to any of the scholars who have helped them that degree of independence without which the help of specialists, as such, can have no value. It is a fact not very well recognized, we fear, at Oxford, that conspicuously good treatment even of matters of syntax or of etymology can only be given by men whom years of toil have qualified to speak on such matters. Literary taste and wide reading are not enough. When the next Greek-English dictionary comes, we hope it will come from an editor of literary taste and wide reading, and an instinct for accuracy. We hope he will have the assistance of numerous scholars in searching out material, and of several specialists in treating the materials amassed. And we hope he will know accurately the limits of his own special knowledge, and will insist against himself most strongly upon the observance of those limits. But it is no part of a reviewer's duty to discuss the possible plans of the possible maker of a book of the future.

The type and paper of this edition, as of its predecessor, are admirable—a comfort and a delight to the eye. Of the binding, it may be said, perhaps, that schoolboys deserve no better than this gaudy sheep—it will take them some time to wear it out. An occasional book lover will prefer to buy the sheets.

RECENT POETICAL TRANSLATIONS.

THE name of Omar Khayyám is not to be found, so far as we know, in any English cyclopædia; and yet no Oriental poet is read with such delight by a large circle of English readers. This enthusiasm for the astronomer bard is mainly due, no doubt, to the extraordinary vigor and beauty of the translation of his 'Rubáiyát' by Mr. Edward Fitzgerald. So unquestionable is this fact that the main interest of any new translation lies in the opportunity it gives of settling the vexed question, how much of this fine poetry is to be attributed to Omar, and how much to Fitzgerald. This alone would lend importance to the recent version, by Mr. E. H. Whinfield, of what he prefers to call simply 'The Quatrains of Omar Khayyám' (London: Trübner). Mr. Whinfield's experience in the Bengal Civil Service must have insured him opportunities for Oriental study; and he gives a guarantee of fidelity by affording us, unlike Mr. Fitzgerald, a reference to the precise chapter and verse of each "quatrain"—arranging them, as did his predecessor, at his own discretion. He gives us also a much larger variety of these remarkable verses, his collection offering 253 in all, whereas Fitzgerald gave only 75 in his first edition, 110 in his second, and 101 in his third.

Those who have carefully examined the great variations in the successive editions of Fitzgerald's translation, and, still more, those who have compared his striking version of the 'Agamemnon' of Æschylus (see *Nation*, vol. xxiv., p. 310) with the original, must own that he belongs to the very loosest school of translators, and that it is very hard to tell whether, in any given case, he is offering a translation or a paraphrase. The trouble is that, where the result is so fine, the reader does not much care whence it came. If Whinfield best represents the poet Omar, we can only say that we prefer the poet Fitzgerald. Compare, for instance, the passionate enthusiasm of

> "Here, with a little Bread beneath the Bough,
> A Flask of Wine, a Book of Verse—and Thou
> Beside me singing in the Wilderness,
> Oh, Wilderness were Paradise enow!"
> (Fitzgerald, xii., 2d ed.),

with the tameness of

> "Give me a flask of wine, a crust of bread,
> A quiet mind, a book of verse to read,
> With thee, O love, to share my lowly roof,
> I would not take the Sultan's crown instead"
> (Whinfield, ccxxxiv.).

Or compare that superb symbol of this mortal body,

> "'Tis but a tent where takes his one day's rest
> A Sultan to the realm of Death addrest;
> The Sultan rises, and the dark Ferrásh
> Strikes, and prepares it for another guest"
> (Fitzgerald, xlv., 3d ed.),

with the mild quatrain,

> "This body is a tent, which for a space
> Doth the pure soul with kingly presence grace;
> When he departs, comes the tent-pitcher, death,
> Strikes it, and moves to a new halting-place"
> (Whinfield, xxxvii.).

Or contrast this strong verse, having a sweep like that of an eagle's wing,

> "I sent my soul through the Invisible
> Some letter of that After-life to spell;
> And by and by my soul returned to me,
> And answered, 'I Myself am Heaven and Hell'"
> (Fitzgerald, lxvi., 3d ed.),

with the feebleness of this new rendering:

> "Pen, tablet, heaven, and hell I looked to see
> Above the skies from all eternity;
> At last the master and sage instructed me:
> Pen, tablet, heaven, and hell are all in thee"
> (Whinfield, lxviii.).

Yet this disparity does not destroy the interest of the comparison, but rather enhances it. The translators illustrate each other; and it may be, after all, that neither is Omar, just as neither Pope nor Chapman is Homer. Even if the two only give between them the maximum and minimum of the poet's quality, it is something to know what that range is; and we fortunately have now the German version of Bodenstedt with which to compare them both. It must be said, in justice to Mr. Whinfield, that his work seems to grow stronger as it goes on, and that the powerful closing quatrain is rendered with a vigor worthy of Fitzgerald himself:

"Khayyám of burning heart, perchance to burn
In hell, and feed its balefires in thy turn,
Presume not to teach Allah clemency,
For who art thou to teach, or He to learn?"

The same publishers have included in the same valuable "Oriental Series" a versified translation of Jámi's celebrated poem, "Yúsuf and Zulaikha," by Mr. Ralph T. H. Griffith. The poem, as is well known, is founded on the Scriptural story of Joseph and Potiphar's wife, the difference being that in the Persian tradition all is spiritualized, and the allegory, like that of Cupid and Psyche, is held to represent the soul's pursuit of the highest good. Zulaikha is humbled, purified, regenerated, and at last united to the chaste and loyal object of her love. This tale is told through a great many prolonged cantos, which are, after all, no more unreasonable in their length than is the 'Faerie Queene' or the 'Orlando Furioso.' Still, the tale must be owned to be rather cloying with a commonplace and fatiguing sweetness, like that of Oriental sweetmeats; while sometimes we come on curious Eastern comparisons, such as seem to a Western reader to go beyond the verge of the grotesque. For instance,

"Twelve months Zulaikha declined and sank,
And the fair full moon to a crescent shrank;
One eve she sat curved like the young moon with woe,
And her eyes were red like the morning's glow" (p. 60).

Or this, which is perhaps the highest poetic statement of what physicians call *ecchymosis*:

"She would strike her soft knee with her hand till the blue
Of the lotus supplanted the jasmine's hue" (p. 277).

There is much scattered beauty in the volume, but no passages of concentrated power; all is diluted and saccharine.

We pass to another book, which, though it does not consist of translations, can best be grouped with them, especially as much of it is made up of avowed paraphrase. No poet has more just reason to attribute fickleness to the American public than Mr. Edwin Arnold. No English poem since 'Festus' has been received among us with such a spasm of universal favor as his 'Light of Asia'; and as an immediate reaction greeted the arrival of Mr. Bailey's second volume, so has it been with the reception of Mr. Arnold's 'Pearls of the Faith' (Boston: Roberts Bros.). Yet the public has not been wholly to blame. No power can make Mohammedanism as poetic as Buddhism; and the beautiful story of Buddha was to most unlettered readers quite unknown till Mr. Arnold's attractive rendering of it. It may be, also, that Mr. Arnold himself is partly to blame, and that he may have suffered from the great haste of production which, by his own statement, has marked this book. Certainly the work has received but little justice from the critics, for it has in it much that is not only curious, but beautiful. The trouble is, that, apart from the well-known poem, "He who died at Azan"—which cannot be said to be improved in its new form—this volume contains but little that takes hold of the heart. That the defect is not wholly in the intrinsic coldness of the religion it delineates, is clear to those who remember the delight inspired by Lord Houghton's 'Palm Leaves,' and the especial beauty of the religious sayings of the Mohammedan prophetess Rabia, as there versified. Nor can the present book be favorably compared with 'The Song of Songs'—the third book in Mr. Arnold's "triology"—for that is full of fire and picturesqueness, and has, indeed, been criticised rather for undue ardor than for the want of it.

Another work which belongs on the shelf of Oriental poetry is Rückert's 'Wisdom of the Brahmins,' of which the first six books are translated by Rev. C. T. Brooks (Boston: Roberts). Yet it is to be feared that this also is one of the books which do not yield the reader enough to repay the labor they have cost the translator. Some of Rückert's "Strung Pearls," as restrung many years ago by Rev. Dr. Frothingham, have as much pith and beauty as any series of couplets that can be quoted; and this poet's versification is perhaps unequalled in the later German generation. But the test of a book is in its readableness, and the admirable translation of Mr. Brooks cannot make these many pages continuously attractive, even to those who followed the same skilful translator with some difficulty through the 'Layman's Breviary' of Schefer. Yet the reader comes upon couplets every now and then which are as pithy as the author's earlier strains. This, for instance:

"The rough may be planed down, the dull made sharp; with one
Who has too fine a point there's nothing to be done" (p. 41).

Mr. Brooks, in his preface, reminds us that Rückert died so lately as 1866, and that his last rhymed piece was a tribute to President Lincoln.

An attractive little book is 'Mountain Psalms,' by Joseph Victor von Scheffel, translated from the German by Mrs. Francis Brünnow (London: Trübner). Part of the interest lies in the fact that the author of this bit of devout mysticism is the self-same Scheffel who is dear to the heart of every German student, and the uproarious fun of whose "Gaudeamus" has been so well translated by our countryman, Mr. Leland. As in his amusing geological songs the poet has turned the megatheriums and the cave-dwellers into poetry, so here he leads his hermit of Falkenschucht far up the Alps and weaves fog-bank and glacier into triumphant song. In truth, it is the same vigor and animal spirits which carry him through both performances; his ever-climbing monk might be a saintlier twin-brother of that inexhaustible reveller, the knight of Rodenstein, in Scheffel's lively ballad—who swallowed two German villages during his last carouse at the Stag Inn at Heidelberg, bequeathing a third village to the university and his thirst to the students. There is even a touch of the old fun when the pious hermit in the 'Mountain Psalms' stops his climbing for a moment to go fishing on the lake. It should be added that the book is prettily illustrated from the designs in the original German edition.

Miss M. A. Biggs's version of 'Konrad Wallenrod,' from the Polish of Mickiewicz (London: Trübner), is eminently smooth and graceful, but has for English-speaking readers the drawbacks belonging to all Slavic poetry in the proper names it presents. It is needless to point out how much of the beauty of Milton's or of Tennyson's blank verse is due to their use of proper names, whether English or foreign; the "leaves in Vallombrosa," "the wild woods of Broceliande," are familiar to every ear. But when Miss Biggs tells us that

"The nightingales from Kowno's groves of oak
Still with their brethren of Zapuszczan Mount
Converse, as once, in Lithuanian speech" (p. 3),

it is impossible to take much interest in them; we do not know these nightingales. Moreover, there is something revolting in the story itself; we can pardon an humble spy, like Cooper's Harvey Birch, but it is difficult to see any chivalry in one who, like Konrad Wallenrod, so deceives the enemy as to be appointed general of a hostile army, and betrays to defeat and destruction the troops under his own command. Nor can we acquit the Polish poet of fully comprehending his own work, when he takes his motto from Macchiavelli, and proclaims that men should be at once foxes and lions (*bisogna essere volpe e leone*).

Of retranslating the Greek dramatists there is no end; and, in the multiplicity of new versions, one sometimes sighs after the time when there was for these poets no recognized English medium except in honest old prosaic Potter or earlier Francklin. This latter professor and divine dedicates his translation of Sophocles (1788) to the Prince of Wales, with the loyal remark that "Sophocles seems purposely to have waited for the present happy opportunity of making his first appearance amongst us under the patronage of your Royal Highness." Sophocles is now to be congratulated on the further happiness of making still another appearance in the reign of Victoria, and under the auspices of Mr. Robert Whitelaw, late Fellow of Trinity College, Cambridge, and now Assistant Master in Rugby School (London: Rivingtons). He has given us all the seven remaining dramas of Sophocles in a compact and well-printed volume, which at once invites the test of comparison with other versions.

Let us take, for instance, the opening lines of 'Œdipus the King,' best known as 'Œdipus Tyrannus,' a play lately made familiar to Americans by its presentation at Harvard College, and by the pleasing American translation of Mr. W. W. Newell. These lines are thus rendered by Mr. Whitelaw:

"Children—of ancient Cadmus latest birth—
Why in such eager session sit ye here,
With chaplets twined around your suppliant boughs?
And all the city is thick with incense-smoke,
And loud with lamentation and with dirge:
Whereof, O children, choosing not to hear
From lips of others, hither I have come—
I, who am called all-famous Œdipus."

Here the first line is more simple and literal, as well as more poetical, than the

"Children, young care of Cadmus' ancient fold"

in Campbell's version; while, in the second line, both Campbell and Whitelaw lose the effect of μοι, through which the monarch claims the gates of the palace as his own. Mr. W. W. Newell's translation gives it more literally, "at my doors." In the third line, Whitelaw substitutes the modern "chaplet" for the Greek στέμματα, which were in this case boughs decked with wool-tufts, and, as the essence of the supplication lay in these appendages, which gave a sacred immunity to their bearers, it is better to designate them distinctly, as is done by Campbell. In the fifth line there is a more serious variation from the literal Greek. "Lamentation" and "dirge" are a tautology, or very near it; and where a Greek translator commits a tautology he may be quite sure he is wrong. The truth is, that there is no repetition, but an antithesis in the two words παιάνων and στεναγμάτων, the one implying worship, the other lament; and the word "pæan" employed by Campbell, or "holy chant" (Newell), or "sacred songs" (Potter), or even "prayers" (Francklin), would be better than Mr. Whitelaw's "lamentation." Again, in the eighth line, "all-famous Œdipus" is far too brief a summary of the proud and swelling boast furnishing so fit a key-note for the tragedy that is to follow:

ὁ πᾶσι κλεινὸς Οἰδίπους καλούμενος.

Campbell has it more amply,

"Great Œdipus, of universal fame."

We have taken a few lines by way of example, in order to ascertain under what class of translators Mr. Whitelaw is to be ranged. Taking Browning's and Fitzgerald's versions of the 'Agamemnon' to represent two extremes—the one being severely literal, the other containing whole passages that can scarcely even be called paraphrases—we find Mr. Whitelaw's work to belong somewhere between them, being fairly classed, perhaps, with the graceful translations of Dean Milman. In other words, he aims to give not only the truth but the beauty of his author, and succeeds well in both. The best test of this is in his choruses. If there is anything in all literature which stands for pure beauty, it is the chorus of a Greek play. Instead of cold, pure marble, it gives us passion and pathos and music; to translate it is like handling pure flame. To find equivalents for those wondrous compound epithets whose interfusing tints can no more be disentangled than one can dissect the sunset—this would demand an almost preternatural gift of language; nobody can do it well, and it is only a question of degree of failure. Yet in such a competition Mr. Whitelaw surpasses most of his competitors. Take, for instance, that wonderful lyric passage where Œdipus comes forth from the palace after blinding himself in his despair:

ἰὼ σκότου
νέφος ἐμὸν ἀπότροπον, ἐπιπλόμενον ἄφατον,
ἀδάματόν τε καὶ δυσούριστον ὄν.
οἴμοι.
(vv. 1313-16).

Whitelaw's translation is:

"O thou thick cloud of darkness,
That on my life hast settled,
Abominable, unutterable,
Indomitable,
By pitiless winds swept hitherward on me.
Alas!" (p. 55.)

It might seem a confessed failure when a translator needs twenty-three words to render thirteen; but for this the difference between the two languages is largely responsible. There is as much difference between Greek and English in the power of condensation as between English and our American-Indian dialects; and those who have ever heard, on the frontier, the oral translation of an English sentence to an Indian audience know the strength of this comparison. All the last line,

"By pitiless winds swept hitherward on me,"

is but the rendering of a single word, δυσούριστον, for which the briefest and boldest English equivalent would be "cruelly-wafted," or—to relax the grasp of condensation a little—"unkindly-guided-favoringly-on," or, as Liddell and Scott have it, "driven by a too favorable wind." The delicately combined meaning is that the favorable wind has become a source of tragedy in its result; and even Mr. Whitelaw's seven words do not quite exhaust this meaning. Other translators, in being briefer, have been less expressive. Campbell has "too surely wafted on," Newell has "sailing upon me," while Potter and Franklin omit the phrase altogether. Indeed, it is impossible to compare these older translators with the later ones, and not see how great the advance that has been made. One might almost say that the poorest English translation of a Greek play, if executed within the last thirty years, is better than the best which came before that epoch. And among these later versions we have examined none that is, on the whole, more enjoyable or more trustworthy, so far as Sophocles is concerned, than that of Mr. Whitelaw.

LALOR'S CYCLOPÆDIA OF POLITICAL SCIENCE.

Cyclopœdia of Political Science, Political Economy, and of the Political History of the United States. Edited by John J. Lalor. Vol. ii. East India Company—Nullification. Chicago: Melbert B. Cary & Co. 1883.

THE second volume of this work is much superior to the first, both in the number and range of the original articles and in the discrimination exercised in the translations from foreign sources. It is also larger by about two hundred pages than the first volume. Among the contributors who did not appear in the former volume we notice the names of Edward Cary, Haydn Smith, A. S. Bolles, Franklin B. Hough, E. Munroe Smith, Worthington C. Ford, Jos. D. Weeks, A. M. Sullivan, M.P., Henry Fawcett, R. W. Raymond, Ernest Renan, G. Koerner, and A. Leroy-Beaulieu.

Mr. Alexander Johnston, to whom has been assigned the department of Political History of the United States, contributes nearly one-third of the volume. It is impossible to speak too highly of the painstaking carefulness of Mr. Johnston's work. His sense of proportion is excellent, and his accuracy even in small matters remarkable. The more important articles from his pen are those on Electoral Commission, Electoral System, Embargo, Federal Party, Citizen Genet, Habeas Corpus, Jay's Treaty, Kentucky and Virginia Resolutions, and Nullification. There is scarcely any subject connected with the political history of the United States, coming within alphabetical range of the volume, which is not treated with sufficient fulness for the ordinary needs of the professional man, while the authorities for fuller investigation are pointed out to the student.

Mr. Edward Cary contributes articles on Education and the State, and on Gambettism. The latter, which necessarily includes the biography of Gambetta, is the best compendium of French political history since Sedan that we have seen. Mr. A. R. Spofford furnishes articles on the Bureau of Education, Homestead and Exemption Laws, the Navy Department, and the Lobby. It is gratifying to learn that one so near to the lobby as Mr. Spofford, and who has had it so long within his field of vision, has a low estimate of its power and influence, which he thinks have been greatly overrated. There is no such thing, he tells us, as an organized lobby at Washington, but rather a succession of lobbyists, who come and go as this or that interest happens to be affected by legislation. Bad legislation, he adds, is the fruit of ignorance, not of corruption. The baneful influence of the lobbyist is not that he bribes Congressmen, but that he befogs them with *ex-parte* testimony and argument. Prof. E. J. James, of the Normal University of Illinois, furnishes articles on Excise, Emigration and Immigration, Factory Laws, Finance, Insurance, and Labor. Mr. James's acquaintance with the whole range of German investigations of economic and social questions gives to his treatment of these subjects a peculiar value to persons who do not have access to the original works. The article on Finance is, in the main, a summary statement or condensation of the 'Finanzwissenschaft' of Adolph Wagner. The article on American Finance is from the pen of Mr. A. S. Bolles, the author of the 'Financial History of the United States from 1789 to 1860.' Mr. Bolles's article is defective as to the later period of American history—*i. e.*, from 1860 to 1882. It does not give a precise and consecutive statement of the financial transactions of the Government; makes no mention, for instance, of the compound-interest notes, or of the 7-30s, or of the successive refunding operations by which the interest on the public debt has been so greatly reduced. These matters are treated in a broad and general way, it is true; but in a cyclopædia we expect to find all the needful facts and dates arranged in chronological order.

The paper on Fisheries, by G. Browne Goode, is precisely the kind of article which the statesman, editor, professional man, or general reader who desires correct and copious information will find most useful. It embraces everything of importance commercially and statistically to be found in the reports and bulletins of the United States Fish Commission, together with a general survey of foreign fisheries. The fisheries of the world, in the order of their importance, according to Mr. Goode, are those of the United States ($44,870,252), Great Britain ($40,000,000), British North America ($27,000,000), Russia ($22,000,000), France ($17,000,000), and Norway ($12,000,000). The largest fishery in the world is the United States oyster fishery, which yields $13,438,852. The article on Forestry, by Franklin B. Hough, also deserves especial mention. Probably few people in the United States are aware that Germany has nine schools of forestry, Sweden eight, France four, Russia three, Austria seven, and Italy, Switzerland, Spain, Portugal, and Denmark each one.

Among articles of an abstract character, the longest and one of the best is that on Free Trade, by David A. Wells, who also furnishes articles on Extradition and on Navigation Laws. The editor, in a note at the end of the article on Free Trade, promises one in the next volume on Protection from the protectionist point of view. This plan appears to us a mistaken one. There is no more reason for exercising impartiality in this matter, and letting the other side be heard, than there would be for giving the Greenbackers a chance to reply to Mr. Horace White's article on Money, which has a place in the present volume. We make this observation not because we happen to agree with Mr. Wells's view, but because a work of this kind ought to have an opinion of its own as to a question so thoroughly settled in the domain of science that, as Mr. Wells says, "there is not to-day a first-class college or institution of learning in the whole world that would admit or invite to its chair of political economy a person who believed in the theory or expediency of restricting exchanges as a means of increasing popular welfare and abundance."

Mr. Simon Sterne writes the article on Monopolies, bringing to its consideration a great deal of special training, and as much fairness as can be looked for in the present unsettled state of opinion with regard to the railway problem. Mr. Sterne has little confidence in legislative control of railways so long as the civil service remains a shuttlecock in the hands of politicians. The vigor of his remarks upon this point leaves nothing to be desired. "There is scarcely a State in the Union," he says, "in which the adjournment of its legislative body is not hailed with delight, nor its convening regarded with dread by the citizens of the State; and so long as this feeling is justified, it is almost hopeless to clothe such legislative bodies with power sufficiently great to hold other sinister powers in check. Such a transfer of power is quite fairly regarded as making a leap in the dark." On the subject of "land monopoly," Mr. Sterne combats the positions of Mr. Henry George from the same point of view, and with equal terseness, thus:

"The ownership [of land] by the government means substantially the control of such ownership by those who have, for the time being, possession of the reins of government; and government is as yet so defectively organized, so little even in free countries does it represent

either the will or the interests of the whole people, and so far are the incumbents of official positions from subordinating their own personal interests, and the interests of their families and friends, to that of the public weal, that such ownership by the public, which in other words means control by the politician of all the landed property of the community, would create a tyranny so burdensome and so intolerable, and create an unequal taxation so monstrous, that nothing in modern history would at all form a parallel."

Mr. Sterne also furnishes the article on Legislation.

The article on Nationality, by Prof. Munroe Smith, of Columbia College, contains nearly everything that a person could look for under that title—even the laws and customs regulating citizenship in Guatemala, Hayti, and Monaco. The last work of the late Prof. Cliffe-Leslie is found in this volume under the titles: Fictions in Law and Political Economy, Guilds, Interest, and Historical Method. Mr. John W. Clampitt furnishes a number of articles on legal subjects, including one on Military Commissions, which gives a résumé of the trial of Mrs. Surratt, whom Mr. Clampitt pronounces an innocent woman, he having been her counsel on the trial. Mr. John Fiske writes articles on the House of Commons and the House of Lords, and also on Great Britain. Mr. F. W. Whitridge contributes those on Instructions and Trial by Jury; Mr. J. C. Bancroft Davis, one on the Geneva Arbitration; Mr. G. Koerner, one on the Monroe Doctrine; and Mr. Dorman B. Eaton, one on Elective Judiciary. Mr. R. W. Raymond brings together in readable form a great deal of information respecting Mines and Mining Laws and Customs in the United States. Mr. Worthington C. Ford writes several good articles on economic subjects, including one on the Internal Revenue of the United States. The subject of Municipal Bonds is treated by Mr. Geo. Walton Green, who gives an outline of the litigation which has resulted from attempts at repudiation of debts by cities and towns. One of the best articles in the work is that of Max Eberhardt on the German Empire. The article on Mohammedanism by Ernest Renan, although only five pages in length, is a profound disquisition on the state of Arabian society and on Oriental modes of thought contemporaneous with the founder of that religion.

Young Japan. By J. R. Black. 2 vols. 8vo. Baker, Pratt & Co. 1883.

"To the dignity of history, this book"—in two well-printed volumes of nearly one thousand pages—"makes no pretension." Large portions of the work consist of extracts, some of which are quite long, from Alcock, Oliphant, Mitford, the British Blue Books, and one American author, Mr. E. H. House. Most of the remainder is a rearrangement of the voluminous matter collected by the author from the newspapers of which he was formerly editor. These were the *Japan Herald*, the *Japan Gazette*, and the *Far East* (a monthly magazine, illustrated with photographs, published at Yokohama), and the *Nishin Shinjishi* (Daily Newspaper), owned and edited by him in Tōkiō. This latter was the first newspaper "worthy of the name" published in the Japanese language. Its freedom of thought soon brought the proprietor into contact with the Mikado's Government. A few cunning officers, by a sharp game of heathenish trickery (which, in method, bears a surprising resemblance to some of the wrecking operations of New York financiers), "transferred" the plant and paper, so that it is now an "official" organ. This turn of fortune was a killing blow to the former owner; and though he lived several years afterward engaging in various precarious enterprises of journalism in China and Japan, his loss of health and happiness dated from his failure in Tōkiō.

One wonders, first and last, what is the reason for the existence of these portly volumes, costing an eagle, since almost all their matter, even to details, is already accessible in the books which now fill the overburdened shelves in the library of works on Japan. The book in its present form will be read almost exclusively by old residents in the treaty ports, but hardly by the general public. Their substance could have easily been presented in a duodecimo, to the advantage of the buyer's purse and the reader's mind. The style of narration is simple, clear, and garrulous, and needs a large correction for national parallax, since British eyes can see very much of justification in the policy of Sir Rutherford Alcock, Sir Harry Parkes, and the Foreign Office in London, which no Japanese or American can possibly see. The tone of the book impresses one with the idea that Mr. Black had the fear of his countrymen, especially the official portion of them, before his eyes, and that American opinions on Japanese subjects were his especial horror; or, to state it mildly, such un-British notions seemed to him unorthodox and dangerous.

The book partakes largely of the nature of the author in many curious features. A warm-hearted Scotchman, a rover from his native heather in many parts of the earth, a musician and singer, a photographer, a journalist, and at last a writer of books, he was clever in everything and excellent in nothing. A man of delightful presence and magnetic personality, a generous friend, though not a favorite of fortune, he died while engaged in the task of writing 'Young Japan.' A posthumous chapter and index have been added by his executors, and the book, "printed at the private printing-office of the author, No. 16 Yokohama, Japan," is a good specimen of typographic art. Its sub-title is "Yokohama and Yedo: A Narrative of the Settlement and the City from the Signing of the Treaties in 1858 to the Close of the Year 1879. With a Glance at the Progress of Japan, during a Period of Twenty-one Years."

James Monroe, in his Relations to the Public Service during Half a Century, 1776 to 1826. By Daniel C. Gilman, President of the Johns Hopkins University. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1883. 12mo, pp. 287.

It has become the fashion to disparage the abilities of Mr. Monroe, and certainly, in comparison with either his predecessors or his immediate successors, he must pass as a second-rate man. But it is no disparagement to a statesman to rank him after the giants of those days, and there are few of his successors who have so dignified their high office by the combination of personal character, statesmanlike abilities, and thoroughness of preparation. A man who was prominently mentioned as a successor to Jefferson, and who had taken so active a part in the diplomatic relations of three administrations, cannot be thought in any sense an unworthy incumbent of the office. Add to this that his name is inseparably associated with a great public principle, and we see good reason for including him in the series of "American Statesmen."

President Gilman's remarks upon the subject of his memoir are worth citing (p. 213):

"He has suffered by comparison with four or five illustrious men, his seniors in years and his superiors in genius, who were chiefly instrumental in establishing this Government on its firm basis. He was not the equal of Washington in prudence, of Marshall in wisdom, of Hamilton in constructive power, of Jefferson in genius for politics, of Madison in persistent ability to think out an idea and to persuade others of its importance. He was in early life enthusiastic to rashness, he was a devoted adherent to partisan views, he was sometimes despondent and sometimes irascible; but as he grew older his judgment was disciplined, his self-control became secure, his patriotism overbalanced the considerations of party. Political opponents rarely assailed the purity of his motives or the honesty of his conduct. He was a very good civil-service reformer, firmly set against appointments to office for any unworthy reason."

Perhaps the best evidence of Monroe's genuine statesmanship is the fact that under his Administration party dissensions died out, and the era of good feeling set in—for a moment. The account of his diplomatic performance in France during Washington's Administration, which is the least creditable part of his career, is one of the most entertaining parts of the volume. Whatever defects marked his temper and judgment were most conspicuous at this time and in these relations. But what has impressed us most in his history, as here related, is his course during Madison's Administration—the soundness and good sense of his letters to the President in relation to General Armstrong; his prompt and sagacious action at the time of the attack upon Washington—his assumption of the duties of Secretary of War being the turning-point in the administration of that department. He was equal to the situation, and it was a very difficult one: we cannot say more of any man than that.

Nevertheless, Mr. Monroe's greatness—if we may call it greatness—was that of the man of action rather than the thinker, and for this reason he appears little by the side of his predecessors, the men who *thought out* for this nation the principles of independence, organic law, and national policy. So, with regard to the Monroe doctrine, it may very well be that, as is frequently asserted, it was formulated by the Secretary of State rather than the President. For all that, as President Gilman well shows (p. 215), his whole public career was an embodiment of the principles in question:

"The one idea which he represents consistently from the beginning to the end of his career is this, that America is for Americans. He resists the British sovereignty in his early youth; he insists on the importance of free navigation in the Mississippi; he negotiates the purchase of Louisiana and Florida; he gives a vigorous impulse to the prosecution of the second war with Great Britain when neutral rights were endangered; finally, he announces the 'Monroe doctrine.'"

We must not close without calling attention to the admirable bibliography of works relating to Monroe and the Monroe doctrine in the appendix, prepared by Mr. J. F. Jameson.

The War Between Peru and Chile, 1879–1882. By Clements R. Markham, C.B., F.R.S. R. Worthington 1883.

The accounts hitherto published of this war have been almost entirely from the Chilian side, the most important being the elaborate work of Señor Mackenna, published at Santiago, and the excellent history by Señor Arana which was reviewed in these columns last year. Mr. Markham has determined to write a history from the Peruvian side. He was well fitted for the task by former residence in the country, by familiarity with its language and people, and by study of their customs and habits for nearly thirty years. He is, in fact, a well-known authority on Peru. Under these circumstances, his book was looked forward to with much interest, in the expectation that it would present a view of the Peruvian side of the contest which would be worthy of careful study. It is impossible to deny that

this expectation is not realized. The book is filled with epithets rather than calm judgments, and is so violently partisan as to be unworthy of credence. It represents the Peruvians as a chivalric and noble people, fighting gallantly for their homes, while the Chilians are a scheming, cruel race, spreading devastation and bloodshed. The Chilians are constantly compared to Pizarro and his followers, but while "the worst of the older conquerors sought for gold, their Chilian imitators wanted to appropriate manure." The origin of hostilities is traced to an insatiable desire on the part of Chili for conquest and war, and the seizure by Peru and Bolivia of the nitrate establishments owned by Chilian subjects within their territory is declared to have been perfectly justifiable. Peru is represented to have been unprepared for war, and Chili to have been scheming for years to bring it about; the Peruvian troops are undisciplined volunteers, fighting like heroes though lacking military training, while the Chilians are well organized, well armed, and well drilled, but animated by the spirit of butchery; Grau's "deed of patriotic heroism will never be forgotten," but Lynch was merely a freebooter and blackmailer—an "experienced cattle-lifter."

This is the tone of the whole book. It might well have been written by a native Peruvian; and, if nothing more can be said on their side of the case, it will only confirm the impression which has been hitherto received, that the Chilians gained the victory because they were the superior race—more sober, industrious, and intelligent, capable of greater endurance, and determined to maintain what they deemed to be their rights by actual deeds, and not by proclamations and bombast.

American Humorists. By the Rev. H. R. Haweis. Funk & Wagnalls.

Mr. Haweis has collected into a small volume his lectures on American humorists. These are Washington Irving, Dr. Holmes, J. R. Lowell, Artemus Ward, Mark Twain, and Bret Harte. His account of these writers is mostly random talk, founded on no critical principles; and the very fact that he lumps them all together as "humorists" shows clearly enough, if there were not plenty of other evidence, that he brings little acumen to his task. If Irving is a humorist, surely we need some different term to define A. Ward; and if by a humorist is meant any one with whom the production of humorous literary effects is the efficient cause of composition, then such writers as Lowell, whose wit and satire have always some serious object, must come under a different head. If we apply "humorist" with so little discrimination, what is to be done with the wits, the satirists, the jesters, the wags, the buffoons, and the clowns? "Funny man" is a convenient term for a certain kind of writer; but will the time come when some successor of Mr. Haweis will imagine "funny man" to be a sufficiently descriptive epithet to apply to Pope, or Swift, or Butler? Mr. Haweis's lectures are to a considerable extent made up of extracts from the writers he deals with, and, though his powers of analysis are not great, he enjoys so thoroughly the good things that he sets before his readers, that quarrelling with him for this, or for his discursive, disjointed, and inconsequent style, is out of the question.

BOOKS OF THE WEEK.

Allen, G. Colin Clout's Calendar. The Record of a Summer. Funk & Wagnalls. 25 cents.
Bach, Alberto B. On Musical Education and Vocal Culture. Third edition, revised and enlarged. Scribner & Welford.
Braune, W. Gothic Grammar. B. Westermann & Co.
Brockhaus's Conversations Lexikon. 13th ed. Parts 56-60 (concluding vol. iv.). Leipzig: F. A. Brockhaus; New York: L. W. Schmidt.
Brocklehurst, T. U. Mexico To-Day, and a Glance at the Prehistoric Remains and Antiquities of the Montezumas. Scribner & Welford.
Campbell, Helen. The Housekeeper's Year-Book. Fords, Howard & Hulbert. 50 cents.
Clay, Charles M. The Modern Hagar: a Novel. Fords, Howard & Hulbert. $1 50.
Connecticut at the National and State Capitals, 1883. Hartford: *Evening Post* Association.
Craig, T. A Treatise on Projections. United States Coast and Geodetic Survey. Washington: R. D. Cutts.
Creighton, Louisa. Stories from English History. Thos. Whittaker. $1 25.

Fine Arts.

FIFTY-EIGHTH ANNUAL EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.

At the Academy the influence of the new style is stronger and more generally prevalent than it has been before, so that, exclusive of the decidedly feeble and crude works exhibited—the proportion of which shows no abatement—the collection substantially resembles that of the Society of American Artists, to which it is certainly not inferior. Some of the leading artists, as very noticeably Mr. Winslow Homer, exhibit works of distinctly inferior merit, as compared with what they have formerly shown, while some others still sustain their former character, if they do not, in many cases, show any decided advance. We especially regret to find Mr. Homer so far below his mark His single contribution, "The Coming Away of the Gale," No. 290, contains all the bad qualities and mannerisms, the tendency to which we noticed in his contributions to the last Water-Color Exhibition, while it shows few, if any, of the good qualities which gave interest to those works. The design in this case is awkward. The principal figure is conspicuously out of proportion and ill-drawn; the lines of drapery are neither graceful nor natural; the color is monotonous in the extreme—everything being suffused in that purplish hue which is peculiar to Mr. Homer, but which we have not before seen him carry to the same painful extent. Nevertheless, the picture has a breezy effect, and the expression of the nearly-spent fury of the storm on the white foaming sea is in a measure fine and impressive. Mr. George H. Smillie's "Massachusetts Coast," No. 298, represents a calm sea reflecting light gray clouds, with a rocky promontory reaching out into it, and pleasantly-broken rolling upland as a foreground. It is an agreeable picture, though treated in the artist's usual manner, which is growing very conventional. Mr. Arthur Quartley's designs are strikingly similar in character one to another. He, like Mr. H. P. Smith, in whose works we noticed the same tendency in the Water-Color Exhibition, confines himself very closely to one class of effects. We have, in each of them, the same rounded gray and white clouds, with rifts showing blue sky, and water in the same state of slight agitation, and in the same roily condition. The sky in this instance is, however, a particularly fine one. The quality of the blue is very aerial and beautiful, and the white light and pearly gradations are very just in tone and tender in execution. But the water is as mannered and unnatural as ever. Mr. Quartley's powers are considerable, and we regret that he does not employ them more fully in giving expression to accurate and extended observation of nature.

Mr. H. W. Robbins has an exceedingly good subject—"Early Autumn, Adirondacks," No. 324. It is admirably conceived in light and shade, with well-proportioned masses. The distance and middleground are successful in drawing and color, but the foreground is conventional and feeble in both these respects. Mr. Robbins has good feeling for landscape, but his works want more freshness and complete veracity. There are some good landscapes by Mr. John L. Fitch, among which No. 340, "A Pastoral," is noticeable, as showing true feeling for nature and considerable power of painting. Mr. Fitch is not an imitator of the French style; but he possesses many of the good qualities, without the faults, of that style. His color values are excellent, and his execution is broad, yet full of character. Without omitting essential details, he subordinates them well to the entire effect of his subject. There are, however, no very subtle or high qualities in his work. He does not express, any more than our artists generally do, those essential elements of beauty which alone give the landscape significance to the ideal painter. Mr. Jarvis McEntee's "Autumn Memory," No. 353, is another repetition of the subject which he first invented about twenty years ago. There is, perhaps, more strength of tone and vigor of execution than formerly, but there is little, if any, more truth. The drawing is weak, the colors lifeless, and the total effect heavy and leaden. The subject is a picturesque woodland brooklet on a cloudy November day. The ground is strewn with fallen leaves, and naked trees rise against the sky. Notwithstanding the restraint of color in such a subject, it would, in nature, be various and glowing. Even a single dried leaf, if one examines it, will usually be found to contain many changes and modifications of hue. And, in addition to the changes of local color, there will be the changes of light, shade, and reflection. In a litter of such leaves—especially when they are of different kinds—the variety will, of course, be practically infinite. The artist who would faithfully picture the beauty of such a leafy foreground as this will be obliged to employ a wider range of the resources of his palette than Mr. McEntee has done. The distance, also, would show a purer gray, and the tree trunks more color.

Mr. Eastman Johnson, again, is far below his mark this spring. The serious defects of color which we noticed in his work last year are repeated with increased emphasis in his contributions to the present exhibition. They are the most conspicuous in his "Portrait of a Child," No. 348. We are growing weary of the task of pointing out this faultful habit of painting the shadows of objects in uniform brown, whatever their real local colors may be; yet it is a very constant habit with a large number of painters. The quality of the brown employed seems to vary with different individuals. With some, as with Mr. Bridgman, it is bituminous; with others, as with Mr. Vedder, it is more golden; but with Mr. Johnson it is a peculiarly disagreeable purplish brown. In the painting of flesh, or of objects of any warm color, it is perhaps more natural (though it is never justifiable) to paint shadows in brown; but in this picture the child's light-blue garments are shaded with precisely the same brown that is used in shading the steps upon which she is seated. We do not remember ever to have seen a more glaring intance of the violation of right principles of coloring.

In contrast to this there is a great deal of truth of color in Mr. C. Y. Turner's "The Harvest Meal," No. 624, in the corridor. It represents a party of farm laborers dining in the open air in front of a farmhouse. The chiaroscuro is freer than usual from those faults of excessive shade which we have before had occasion to notice in Mr. Turner's work. It is such that while there is much strength of light and dark, there is no loss of color in the shadows. The picture is noticeable for an unusually successful expression of open sunlight, which is secured by the remarkably just management of the color values. The sun-burnt complexions of the men whose faces fall in shadow are almost Venetian in character. The head of the figure to the right is particularly fine for combined fulness of color and strength of shade against the brightness beyond. The corner of the table, also, which projects in shadow against this light, is very subtle and beautiful in its values, with cool sky-reflection on its white cloth. The drawing is rough, but, save in a few passages of drapery, it is good.

Mr. C. A. Platt's "Old House at Chartres," No. 601, is a good ragged sketch, in which the broad relations of things are well rendered. There is a good deal of cleverness, too, in Mr. Percy Moran's "Woods in Winter," No. 595. But the color is impure, and the execution is dangerously slight and facile. It is the facility of immaturity, which can hardly fail to impede, if it does not wholly arrest, progress. There is some very good painting in No. 590, "Two Pipes," by T. Alex. Harrison. The picture deserves a better place than that which it occupies on the floor. Nos. 581 and 586, "Le Viatique, Finisterre," and "Market Day, Pont-Aven," by Clifford P. Grayson, are clever sketches of French peasant life. The very large canvas, high up facing the stairway, No. 629, "Alexander at Persepolis," by Robert Hinckley, is a good illustration of the slight value of academic correctness of execution when not joined with real powers of design. In the South Gallery is a picture by Mr. Harry Chase, No. 365, "Herring Boats Preparing for Sea," which shows feeling and native ability, but is so highly conventional in treatment that we fear the artist cannot reasonably hope to make further progress in this direction. Mr. Chase, like Mr. Quartley, too rarely varies his theme, and his methods have too little individual freshness and truth. Mr. George Inness contributes but one picture, No. 232, "A Summer Morning," which is of very inferior merit. The more obvious color values are fairly well rendered, indeed, but they are not enough to make an interesting and beautiful picture. The most meritorious part of the work is, we think, the passage of furthest distance.

Mr. T. Moran's "Pass of Glencoe, Scotland," No. 221, presents a grand subject in a clever and facile but highly conventional way. Mr. Moran's effects are apt to be too much forced in their contrasts of light and shade. The calm and temperate effects of nature rarely seem to attract his interest. His method of execution appears to be based upon that of the English landscape painters of the last generation, with comparatively slight modification. Mr. Gilbert Gaul exhibits his "Cold Comfort on the Outpost," No. 370, which we noticed in the last Brooklyn Exhibition. We find no occasion to abate the terms of commendation with which we then spoke of it. We would, however, suggest that even Mr. Gaul (in common with our other figure painters, in relation to whom we have before made the suggestion) might derive great profit from the study of such works as those of the English painters, Wm. Hunt and John Lewis. The modern schools afford nothing else, of their kind, so instructive. Mr. J. G. Brown's "A Story of the Sea," No. 258, represents an interesting old sailor explaining the parts of the model of a ship to a wondering boy. As a work of art, however, it exhibits this artist's characteristic mannerisms. No. 368, "Golden Grain," by Edward Gay, is a sweet bit of landscape, very excellent and effective in light and tone, and graceful in composition. Mr. Gay has a fine feeling for landscape. The beautiful aspects of nature do not appeal to him in vain. He has learned a good deal from the art of others, but he retains his own freshness and integrity of conception and execution.

Mr. J. H. Beard, in "The Race for Life," No. 205, makes the first attempt that we have noticed to embody in a work of art the results of recent scientific investigations regarding the movements of animals; but the result is, as might have been foreseen, entirely unsatisfactory. The movement of the dark-colored hound, in this picture, is, to the eye, at once excessively ungraceful and unnatural. The notion entertained by Dr. Stillman and others, who have engaged in these investigations, that the facts of animal action, ascertained by means of instantaneous photography, can have the slightest bearing upon art, is a fallacy which has grown out of a fundamental misconception of the nature of art and of its relation to science. To the artist, physical facts have no importance except in so far as they have effect upon the eye. Whatever may be the actual figure assumed, from instant to instant, by an animal in normally rapid motion, it is, happily, a fact that, to the eye, the movement is graceful, and is never in the least like the series of distorted forms which Dr. Stillman has so admirably shown us are actually assumed. We have no doubt of the facts as science presents them, but we have reason to be thankful that such facts make no impression on the eye. From the artist's point of view, the movements of animals were as well understood at Khorsabad, and on the Athenian Acropolis, as they are to-day.

"Taming a Bird—Portraits of Justine and Bayard Cutting," No. 146, by Anna Lea Merritt, is, we think, the best example of portrait-painting in the gallery, though in conception and treatment it verges on prettiness. This is shown especially in the lips, which are too cherry-red, and in the excessive redness of some of the flesh shadows—more particularly of the hands. Mr. H. Bolton Jones is a painter of marked ability as regards rendering of the color and light of summer landscape. He manages greens with unusual success, presenting their freshness and vividness without crudeness; and his color relations are so just that few artists equal him in expression of sunlight. In his "October, near South Orange," No. 116, the tone is masterly, the verdure is living, and the sky, with its high white clouds, is, we think, the finest in the gallery No. 87, "A Votary of Art," by Benoni Irwin, is worthy of notice as being truer in color than works of this class are apt to be. "The Story of Œnone," No. 462, by F. D. Millet, is, to our minds, an essentially meaningless design. Technically it is but careful and clever academic work, without the merits of execution which we have noticed in some of Mr. Millet's water-color drawings. We recognize in Mr. Millet an artist of marked ability, and we wish he would always employ it in a worthy manner.

There seems no occasion, even did our space permit, to say more upon particular works. We have endeavored to criticise justly and helpfully, but have found ourselves obliged to call attention to so many defects that we fear we may have seemed almost captious. The fact is that the defects of our art are the inevitable result of various abnormal influences, some of which we have endeavored to point out. But, in addition to these, there is another which is now everywhere active, and which sadly hampers the freedom of the artist and complicates the task of the critic. We allude to what may be called the commercial influence. The production of pictures is approaching the nature of a manufacture, and their sale is rapidly passing—indeed, it has very nearly already passed—out of the hands of the artist. It is becoming, all over the world, a mercantile business of great magnitude, conducted by commercial dealers who act as mediators between the artist and the public, and whose sole object is naturally to make money. The style of work which the dealer demands of the artist is, of course, that which he can most readily dispose of. The dealer has not, himself, any preference for one style or quality of art over another. He simply wants what he can sell. He makes it his business to find out who among the rich men of a community are the most likely to be willing to buy pictures, and what sort of pictures they will soonest buy. Now, the average rich man is not highly cultivated in matters of art; and if he cares for it at all, it is chiefly as an appendage which he supposes he ought to possess to the general elegance of his household. The art which will attract such a patron must present those salient and obvious effects which he can appreciate; and such, accordingly, is the kind of art which the dealer demands of the artist. A standard is thus created to which the artist who would gain his bread by painting must, more or less strictly, conform. To this he must at least subordinate any true feeling or cultivation of his own. Matters have now reached a point where the most refined and excellent painting finds no sufficient and steady encouragement to enable artists to cultivate their best powers. The dealers can find no buyers for such work, and the artist must either conform to the demands of the market, or get on without patronage.

The pressure of this commercial standard is now enormous, both in Europe and America, and it is doing more perhaps than anything else to retard progress. A change must come before we may hope for better things—a change which can come through the growth of individual cultivation only. Artists can go but a little way in advance of public taste. They depend upon the moral as well as the material support of the public. At present the individuals who possess any degree of love for art and intelligent appreciation of real excellence are, in America espe cially, so few that their influence is hardly appreciable.

THEATRE CONTEMPORAIN,

20 CENTS EACH.

Under the above title,

WILLIAM R. JENKINS,
Publisher, Importer, and Bookseller,
850 SIXTH AVE., NEW YORK,

Will issue a series of FRENCH PLAYS, carefully selected, bright, witty, and well adapted for students in the language, for general readers, and some of them for amateur acting.

The first number, containing
"*LE VOYAGE DE MONSIEUR PERRICHON,*"
Par Eugène Labiche,
NOW READY.

Shortly, the second of the series, containing "Sa Canne et Son Chapeau" and "La Soupière."

Sent post-paid on receipt of price.

Attention is called to the fact that all the LATEST FRENCH NOVELS are to be had at Mr. Jenkins's store at VERY MODERATE PRICES.

Importation orders carefully filled.

Lippincott's Magazine,

A POPULAR MONTHLY OF GENERAL LITERATURE.

MAY NUMBER
NOW READY.

CONTAINING: 1. SEVEN STROLLERS. Illustrated. By Margaret Bertha Wright.—2. THE JEWEL IN THE LOTOS. A Story. (With Frontispiece.) By Mary Agnes Tincker.—3. IDAHO AND MONTANA. By John Codman.—4. SHADOWS. By John B. Tabb.—5. OUT OF MONEY. A Story. By Emily F. Wheeler.—6. GREAT MINDS AND MATRIMONY. By L. D. Morgan.—7. ADRIFT ON PENSACOLA BAY. A Story. By William L. Murfree, Sr.—8. THE FIELD-SPARROW. (A Fable for Poets.) By William H. Hayne.—9. CHARLES LAMB'S DRAMATIC ATTEMPTS. By J. Brander Matthews.—10. THE STORY OF LITTLE MARY WHITLOW. By Mary E. Wilkins.—11. ASHORE WITH A FLORIDA SPONGER. By Ernest Ingersoll.—12. AN AFTERNOON AT ASHBOURNE. By J. A. Dickson.—13. AMONG CITRUS-BLOOMS. By Charles Burr Todd. —OUR MONTHLY GOSSIP: 1. *Public Topics:* Social Changes and their Prospective Results. 2. *Place aux Dames:* Hypatia. 3. *Anecdotical and Miscellaneous:* Slipped out of History—Words and their Abuses.—15. LITERATURE OF THE DAY.

FOR SALE BY ALL BOOK AND NEWS DEALERS.

TERMS: Yearly Subscription, $3; Single Number, 25 cents. LIBERAL CLUB RATES.

☞ SPECIMEN NUMBER mailed, post-paid, on receipt of 20 cents. (Postage stamps afford a convenient form of remittance.)

The Nation.

NEW YORK, THURSDAY, APRIL 26, 1883.

The Week.

It is reported from Washington that a strenuous effort is making by certain Machine politicians to secure the appointment of a man of their own way of thinking as Chief Examiner under the Civil-Service Commission. It will be remembered that according to the original plan, and, indeed, according to the Civil-Service Reform Bill as passed, the Chief Examiner was to be appointed, or, as the wording is, "employed," by the Civil-Service Commission itself, unquestionably for the reason that there should be complete harmony of views as to objects and means between the Commission and its chief executive officer. But in order to obviate a constitutional difficulty, it was thought best that the President should appoint this officer, with the consent of the Senate, while the clear intent of the law, namely, that the Chief Examiner should be virtually selected by the Commission, remains the same. The President, however, saw fit, in the first instance, not to wait for the Civil-Service Commission to make and present its choice. He used the office of Chief Examiner as a convenient means for the very questionable purpose of eliminating Colonel Burt from the public service in a roundabout way, and when this discreditable performance was accomplished, it was promptly discovered again that there was no hurry at all about the appointment of a Chief Examiner, and that it might properly be put off until the Civil-Service Commission should have drawn up rules and got fairly prepared for practical work. It was so put off, and as the rules have now been submitted to the President, the time for making the appointment has evidently at last come.

We take it for granted that the Civil-Service Commission will honestly and zealously endeavor to make the reform contemplated by the law a reality. That all the powerful political interest born of the spoils system will spare no effort to throw every possible obstacle in its way, is a matter of course. The very first and most essential thing required to enable the Commission to overcome these difficulties is that they should be faithfully and efficiently seconded by their own official instruments, and especially by the man whose business it will be practically to conduct or supervise the examinations. If that officer is inefficient or unsound in his faith, and disposed to play into the hands of the spoils politicians, the whole experiment will be apt to fall into ridicule. It is very natural, therefore, that those who want this attempt at reform to miscarry at the very start, should now make an effort to have a man who, directly or indirectly, will work in their sense put into the Chief Examiner's office. And it is equally natural that they should turn to the President for aid in the execution of this scheme. This is, perhaps, a proper moment to remind him as well as the country once more of the fact that the success of the Civil-Service Reform law rests practically in his hands. The Civil-Service Commission is in the first place only an advisory body. The rules which it draws up are to be submitted to the President for his approval. He may adopt them as they are presented, or change them as he pleases. As they come out of his hands with his approval, he will in a certain sense be responsible for them.

We are advised from Washington that the section of the Civil-Service Reform Act which makes it a misdemeanor for any commissioner, examiner, or any person in the public service, wilfully and corruptly to interfere with the examinations for the benefit or to the detriment of any person examined or to be examined, is "severely criticised by certain parties in the departments." The point of the criticism is that this provision will be taken advantage of by persons who do not succeed in the examinations, to accuse the examiners of unfair dealing as to the ratings, and to harass them with criminal prosecutions. We venture to predict that nothing of the kind will happen if the examiners endeavor to be strictly just and to act upon fair and easily-intelligible principles. It is true that the first impulse of a great many of the persons failing in the examinations will be to revile the examiners. This has always been so, and would continue to be so even if the provision of the law above referred to did not exist. But while this cannot be avoided under any circumstances, there will be but very few if any persons willing to advertise their failure and incompetency by means of a lawsuit. The examiners need not borrow any trouble on that account.

A curious scene occurred last week in the Milwaukee Municipal Court—a tribunal which, we presume, corresponds to a police court with us. It seems that Miss Kate Kane, a "lady lawyer," is a member of its bar, in full practice, and "on several occasions has exhausted the patience of the Court by methods of procedure not in harmony with the rulings of the Judge." Not content with exhausting the Judge's patience, however, she on Friday imprudently resorted to a new method of displaying her dissatisfaction with his rulings by throwing things at him. She first tried to shy an inkstand at him, and, failing in this attempt, she dashed a glass of water in his face. The trouble arose out of the Judge's refusal to assign her as counsel to a prisoner who wished to have the benefit of her professional services. The Court fined Miss Kane $50 for contempt, which, however, did not quiet her, for "she spoke her mind freely to the Judge, using anything but gentle expressions." This little incident does not tend to show that the admission of women to the bar, necessary as it may be on other grounds, will have a softening effect on the tone of professional manners.

Railroad and ecclesiastical interests have again come in collision in Brooklyn. Some time ago Mr. William Richardson—"Deacon" Richardson, as he is popularly called—found it "a work of necessity" to lay railroad tracks in Seventh Avenue on a Sunday. It was the fault of the courts and the people who lived on the line of the street that the work became one of necessity. Some of the citizens were so unreasonable as not to want a railroad on Seventh Avenue, and the courts issued an injunction in their behalf. In order to get the better of these designing persons and of the Judge, the good Deacon set his laborers to work on the Sabbath day, and finished the job before the inhabitants of Seventh Avenue recovered from their astonishment. The temporal courts did nothing about it, but the spiritual court of the Hanson Place Baptist Church, of which the Deacon was a member, summoned him for trial on a charge of "disorderly walk." Upon a careful investigation, his walk was found to be so extremely and inexcusably disorderly that he was promptly expelled. Later he professed profound and bitter repentance, and upon promising not to offend again was received back into the fold. There is now a chance for the Deacon to repent once more. This time it is only a very little one, the laying not of tracks but of a mere switch, still on Seventh Avenue. The particulars of the Deacon's defence are as yet unknown, except that he says the switch-laying was "a work of necessity." Probably the Hanson Place Church will regard it as a work of necessity to discipline him again, for it may well be asked, How shall the Penal Code be enforced against rumsellers and bootblacks and newsboys, if "truly good men," even Deacons, may violate it with impunity? But in any event the Deacon's stock of repentance cannot easily be exhausted.

Texas Siftings complains that "Colonel" Varnell, who some weeks ago assaulted a girl who was taking a walk with him in the moonlight at an evening party, and murdered her father when he came to the rescue, has simply fled to an adjoining county, in which the officers of the law are making no serious efforts to arrest him. It also alleges, in answer to an indignant contemporary—the Honey Grove *Independent*—that while it is true that the penitentiary in Texas is crowded, "murderers who have friends or money" are seldom found in it, and that most of its inmates are petty thieves, who are prevented from cheating justice simply by want of funds. In countries in which justice is venal the petty thief always goes to the wall. The very nature of his crime makes him an object of disgust to a magistrate or constable who is "on the make."

A devoted young High Church curate has got into trouble of a curious kind in London. He was called upon by a romantic devotee, who begged him to come and see her "on a matter deeply affecting her happiness," and, she feared, her life. The good man, distressed and sympathetic, made the visit, and learned,

to his dismay, that the lady loved him madly. She told him, however, that she knew her passion was hopeless, and was prepared to resign him, and die single. But as a parting favor she begged that he would kiss her. The curate, though somewhat alarmed, complied with her request, as any gentleman would under the circumstances, and left her in tears. A few days afterward he received a neat little parcel, which he found, on opening it, to contain an instantaneous photograph of the scene, accompanied by a letter offering him a round dozen of the impressions for twenty pounds apiece. "Negotiations on the subject," according to the story, are now going on, which seems a sad pity. We trust it is not too late to suggest to the reverend victim that he had better save his money, and put the photograph in the hands of the police. As his little adventure has become a subject of public notoriety on both sides of the Atlantic, the damage to his reputation has been "discounted." Paying money to "hush up" an affair of this kind when its details are already known to several millions of people, is most unprofitable employment of it.

The business of office brokerage still seems to flourish in Washington, if we may judge from the advertisements which now and then appear in the newspapers of that city: "A lady will give one-half of salary for a position as copyist in one of the departments as long as position is retained." "A reliable gentleman will furnish the best political papers and pay $150 to any one who will help him secure a position of any kind in Washington." "A gentleman of experience will pay $100 to any one who will secure him a position in one of the departments." And so on. The "lady," and the "reliable gentleman," and the "gentleman of experience," undoubtedly received the next morning, through the addresses given in their advertisements, a number of offers from persons pretending to be able to procure them the desired appointments. In most cases these persons will insist upon an advance of money, a sort of a retainer, to insure the good faith of the applicant, and that is then usually the last the applicant hears of them. In other cases the broker may have an acquaintance with an "appointment clerk" of a department or a chief of division which will enable him to have interviews with those officials and give him the appearance of influence. The applicant is then likely to be bled repeatedly without getting any employment in the end. But sometimes such brokers are acquainted with Congressmen from whom they solicit recommendations for friends, for which they get pay without the Congressman who gives his name being aware of it. We remember a striking occurrence of this kind which happened some years ago. A prominent Senator, a man of the highest character, was asked by a man from his State, who frequently called upon him, to give his recommendation for some subordinate place to a crippled soldier who was in great distress. The Senator good-naturedly did so, and the person who had solicited his recommendation received $100 from the man who got the appointment. The signature of the Senator had thus been sold for $100. How many recommendations of men of high standing and irreproachable character have been sold in like manner, nobody can tell.

Mr. Porter, "the strong man of the Tariff Commission," who has been sending home those exposures of British free trade, is being called to account by the English *Ironmonger*, as well as by Mr. Titus Salt, the great Yorkshire manufacturer, for some of his statements. One of them is his reiterated assertion that no English workman owns his house. This is not true, and if it were true, the reason Mr. Porter gives for it would be incorrect. Large numbers of workingmen—thousands and thousands — do own their houses, in nearly all the great manufacturing towns of the North, through the operation of building societies; and the houses are usually brick or stone. The reason why it is more difficult for a poor man to own his house in England than here is not, as the Strong Man thinks, because his wages are lower, but because the transfer of landed property is attended in Great Britain with such enormous law costs as to make the purchase of single small lots almost impossible. The building societies meet this by purchasing in large blocks and then dividing them up, so that the costs are distributed. The *Ironmonger* also flatly contradicts the Strong Man's stories about the rate of wages.

The past week has been an uneventful one in the general mercantile and industrial business of the country. The expectation of trouble among the Western iron-workers has not yet come to anything, though it is predicted that there will be lock-outs at Pittsburgh and other places. The grain movement at the West has fallen off largely in the last fortnight, and this helps to sustain prices, which would otherwise decline, in view of the improved prospect for winter wheat as compared with a couple of weeks ago. The number of failures, as reported weekly by the mercantile agencies, continues to be from 60 to 75 per cent. greater than during the corresponding weeks of last year, but the aggregate amount of liabilities does not so far exceed last year's. The supply of money continues to increase, and rates of interest, though nominally unchanged, are easier. In all speculative affairs business has been extremely dull. Railway stocks are generally from 2 to 3 per cent. lower than a week ago, though there are some exceptions to the rule. There seems to be no special cause for the stagnation, except the apprehensions of what trouble may grow out of the iron-workers' discontent, and also the possibilities of a freight war between the railroads. In Europe money is very abundant, but speculation is as stagnant as here. The disturbances in Ireland, the unsettled aspect of politics in France, and the talk of other Continental complications, all help to discourage enterprise and speculation.

Another, according to his own account, absolutely innocent man, Curley, has been convicted in Dublin of participation in the Phœnix Park murders. He admits that he was an "Invincible," but somehow, like all the leading Invincibles, happened to be absent when they were performing their greatest exploits. None of them seem to have been there, except the two Careys and the car-driver, Kavanagh, and they say they were only looking on. We know from his own statement that Joe Brady was not there. So that we are driven steadily back on the conclusion that the murders were committed by the Metropolitan Police. There were the usual partisan judge, bribed jurymen, and perjured witnesses, at Curley's trial. What the remaining prisoners will do for counsel remains to be seen. They have no funds for their defence, and the Court has had to assign them counsel; but the barrister selected for the purpose, Dr. Webb, has got tired of his job and asks to be relieved. He had nothing to offer but alibis.

The Irish-American dynamite conspirators in England are having the same unhappy experience as the "Invincibles" in Ireland. The informer has turned up in their own bosom, and is busy swearing them into penal servitude for life, or for a term so long that they will not be good for much after they come out. The story is the old and familiar one of the secret society, the oaths, and passwords, and numbers, and the mysterious orders from the unknown commander-in-chief, which has so long fascinated the imagination of Irishmen, and in which the informer, who lays the whole thing bare in order to get off himself, appears as regularly as the villain in a play. It would seem as if O'Donovan Rossa really had had something to do with this conspiracy, and he appears to have secured in Dr. Gallagher a man of more education and ability than those who usually figure in these enterprises. But their futility is shown by the fact that the conspirators had hardly gone to work when they were discovered and caught, and were hardly caught before evidence sufficient for conviction was forthcoming. The whole party will now pass years in the penitentiary, during which Rossa will be blathering away in great comfort and safety, and every now and then making a sufficient haul on the wages of the very poor to provide him with good victuals and drink.

It appears from the testimony of Norman *alias* Lynch, the informer, that the conspiracy was hatched, and the funds provided, and the emissaries despatched from this city, and we shall doubtless have a renewal in England by the press and the orators of the demand that the United States shall do something to put down the dynamite movement here. Without again going into details, we may say confidently that this Government could do nothing which would be effective, and indeed which would not stimulate the movement, and make martyrs of the persons proceeded against, and bring to their support whatever dormant anti-English feeling there is in the country among native Americans—and there is undoubtedly a great deal even among those who now regard the conspirators with contempt and abhorrence. No more potent means of putting an end to this deviltry can be provided on either side of the water than that which the English Government is now providing. Let the English police be vigilant, and the courts prompt, so

that all murderers are strung up within a month or six weeks of conviction, and dynamite men set to work at useful toil in British dungeons, and we may depend upon it that the enthusiasm of the exploders and the Invincibles will rapidly die out. There is evidently no real grit or fanaticism among them, as we see from the failure of every one of them to confess his crime and glory in it. They all try every possible chance of saving themselves, just like common pickpockets.

The fate of the bill introduced into the House of Commons the other day to provide "Elective Councils" for county government in Ireland, is an excellent illustration of the goodness of the case which the Home Rulers have, and which the late excesses and outrages are obscuring. Irish counties are governed—that is, their taxes are levied—by a Grand Jury composed of large landed proprietors arbitrarily summoned by the High Sheriff. These then add to their number a few of the farmers who pay the rates, taking care, of course, to choose men who will not give them trouble. The general result is that the county taxpayers have no control whatever of the taxes, except the poor-rates, which are managed by an elected board. They are controlled by a small body of one class, far removed from the taxpayers in feeling if not in interest, and generally Protestants, while the taxpayers are Catholics—a fact of some importance in a country in which religious differences play such a deplorably large part. It is but right to add that in this century, at least, Irish county administration has generally been pure; but the wrong of excluding the farmers from all share in the management of their principal direct tax has long been recognized. It was long ago pointed out, too, that if the Irish farmers had more interest in their local government, they would give less time and attention to agitation for national independence and other chimeras.

The history of this wrong is now worth following, because it throws a flood of light on the road by which England has reached her dynamite crisis. It took more than fifty years, one rebellion, and threats of another to bring about Catholic Emancipation. It took twenty years of tumult and bloody rioting to bring about the abolition of the Church Tithes. The tenant-right question was first brought before Parliament in 1835. It has thus taken nearly fifty years of murder, outrage, disorder of every description to get Mr. Gladstone's Land Act passed. The present county government was investigated and condemned in 1840 by Royal Commission, but nothing came of it. A bill reforming it was introduced by the Liberal Ministry in 1849, and abandoned simply because the majority cared nothing about it. A private bill was introduced by a highly respectable Irish member, Sir Denham Norreys, in 1855, and defeated. It was defeated again in 1856 and 1857. In 1861, Mr. Isaac Butt asked for another from the Government of the day, and was refused. In 1868, a Select Committee was appointed to investigate the subject again, and told the same story as the Royal Commission of 1840. In 1875, Mr. Butt introduced a bill himself, and Mr. Trevelyan, the present Secretary for Ireland, voted for it, and so did Sir Charles Dilke and a good many other leading Liberals; but the Tories were in power and it was defeated. Finally, a sham reform bill was introduced by the Tories in 1879, but even this was not passed. The Liberals, when they came into power in 1881, promised another bill, but now say that the time for it has not yet come. There is too much disorder, and treason, and dynamite, and disloyalty. So they will not introduce any bill of their own, and they have just defeated one introduced by a Parnellite, Mr. Barry. Thus the weary game goes on, and the latest coercion bill is always heralded as the sure cure for Irish treason.

The ominous utterance of Prince Bismarck's press-organ, that, if the monarchy should be restored in France, Germany would probably not declare war against France forthwith, but await an attack, "which would soon be made, as under certain conditions the restored monarchy could probably be induced to declare war on Germany without a warning," is merely a repetition of a thought frequently expressed in German journals. It is that a restored dynasty in France would endeavor to win popular favor by seeking to revive the national enthusiasm of the French in the military sense, and that a war against Germany would naturally present itself as the most popular martial enterprise. This explains the fact, which at first sight might seem curious, that the German Government, in spite of its extreme monarchical tendencies, prefers the preservation of the Republic to the reëstablishment of the monarchy in France, for the sake of peace.

The news from Russia continues to be gloomy in the extreme, and the latest news is the more dismal as it comes closely before the time fixed for a coronation. The successive announcements, within a few weeks, of the suicide of the ex-Minister of the Interior, Makoff, of the Post-Director Persilieff's two attempts on his life—suicide and attempts owing to discovered faithlessness in office—of discoveries of gigantic defalcations in the railroad management of the Empire, of the unearthing in the capital of a band of Nihilists and a store of dynamite in their possession, of wholesale arrests of conspirators or suspects in Moscow, have been followed by official statements of the sentences of the score of Nihilists lately tried by an extraordinary tribunal in St. Petersburg. Of these, several were condemned to death, several to penal servitude for life, and many to imprisonment for a considerable number of years. Two of the condemned were executed at the beginning of this week: Bogdanovitch, long hunted as "Kobozeff," who in March, 1881, when Alexander II. was blown up, had laid a dynamite mine for the same purpose in a street adjoining the place of the catastrophe; and a retired naval officer, Butzevitch. The former was hanged, and the latter shot. Among the female conspirators more or less vigorously dealt with by the tribunal—which sat behind closed doors—were two daughters of priests, one of whom was sentenced to imprisonment for life; the daughter of a physician, a noblewoman, a Jewess, and the sister-in-law of an engineer, whose wife and sister are now expiating revolutionary crimes in Siberia. It is clear that the Government, with all its terrorism, is far from having stifled the revolutionary spirit of young Russia, and that this permeates both sexes and all classes alike.

The "revolution in Hayti" is evidently one of those uprisings which, although made in the name of "God and Liberty," and promising a "new era of progress," spring really from nothing else than the restless desire of one man to oust another man from a place which he wants to put himself into—a thing of common occurrence in the tropical republics. This time the insurrection is set on foot by the mulattoes, who, being a minority of the whole population of the republic, want to lord it over the negroes. The mulattoes began the movement with a force of 106 men well armed with breech-loading rifles bought in Philadelphia, and the Government troops, who were miserably armed and disciplined, seem to have run away at the first fire. The insurrectionists are now trying, "in the name of the sovereign people," to organize a provisional government from delegates of local committees. Their easy success so far is explained on the ground that they are "determined and disciplined" men—men "of greater energy and education" than the adherents of the Government. At the head of the revolutionists stands "General" Bazelais, who is represented as a man "of a good deal of intelligence" and as "a ferocious fighter, who goes into action with a short sabre, cutting right and left." He declares, of course, that he will "conquer or die, and never be taken alive."

The French press is indulging in some unseemly mirth over the appeals which Englishmen are making to France and to the United States not to allow their soil to be made the "lair" of the dynamite conspirators. They recall, with some bitter humor, the fact that when France and Austria made similar appeals in old times to Englishmen they were laughed to scorn. But it ought not to be forgotten that the conspirators whose presence England was asked not to tolerate, were simple tyrannicides. They proposed to kill Louis Napoleon and Francis Joseph only. The Irish dynamite men, on the other hand, propose to blow up whole cities and large buildings, and do not care how many innocent lives they destroy in the process. So that what the English are undergoing is not exactly, as the French critics think, "sauce for the gander." It is an entirely new kind of sauce, which has never yet been tried on goose or gander, and the inventors of which are in a new sense, as Sir William Harcourt says, the enemies of the human race. If they carried out their schemes, they would undoubtedly be put in the category of *feræ naturæ*, and everybody be authorized to shoot them on sight. Some of our Southern friends who like that kind of sport could be let loose among them, and would make fine bags.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 18, to TUESDAY, April 24, 1883, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR and his party arrived at Savannah, from St. Augustine, on board the *Tallapoosa*, Wednesday evening. The President went ashore on Thursday afternoon, and a public reception was given him. On Thursday night he was, according to reports telegraphed North, seized with a congestive chill and bilious colic, suffering great pain. Denials were sent from the President's party. Friday night, the reports, however, asserted, was passed miserably, and on Saturday he was feeling very weak, but he determined to hasten back to Washington by rail. The special train left Savannah at 4:15 P. M., on Saturday, and arrived at Washington on Sunday evening at 9:30 o'clock. He asserted on his arrival that he never felt better in his life, and his private secretary said on Monday that the President's only illness was from indigestion one night.

Secretary Folger's health is much improved, and he is again at his desk in the Treasury Department, but he permits Assistant-Secretary French to perform the routine duties, and devotes his energies to points of law.

The Civil-Service Commissioners have completed their rules, and have submitted them to the Cabinet and the President. They were considered at a Cabinet meeting on Tuesday.

Lord Granville's reply to Secretary Frelinghuysen's despatch of May 8, 1882, in regard to the Clayton-Bulwer treaty, was made public on Tuesday. It is dated December 30, 1882. The letter contains the following pertinent paragraph: "The conclusions arrived at by her Majesty's Government, after a careful consideration of the questions raised in Mr. Frelinghuysen's despatch, are that the meaning and effect of Article VIII. of the Clayton-Bulwer treaty are not open to any doubt; that the British Government have committed no act in relation to British Honduras or otherwise which can invalidate that treaty and justify the Government of the United States in denouncing it; and that no necessity exists for renewing any of the provisions of that treaty." Important correspondence between Sir Henry Bulwer and Mr. Clayton, in 1850, is quoted by Lord Granville in support of his position.

The steamer *Tropic* arrived at Philadelphia on Monday from Jamaica. Her captain and first and second mates were arrested for violating the neutrality laws in carrying munitions of war for the Haytian insurgents. They were given a hearing on Tuesday, and the first two were held to answer at the next term of the district court.

The Investigating Committee, to consider the charges against Supervising-Architect Hill, of the Government service, has been making preliminary arrangements during the week at Washington. Mr. Hill claims that the charges are inspired by disappointed contractors and by malice, and that there is not a single thing in his administration of the public buildings that will not stand the closest scrutiny. On Monday the Committee met formally to hear witnesses, but as neither witnesses nor accusers were present, they adjourned until Wednesday, April 25. Mr. Hill, on Monday, filed an answer to specific charges of a Philadelphia firm of contractors.

The supplemental report of the *Jeannette* Court of Inquiry has been approved by Secretary Chandler. The report says that the court have concluded the examination of the survivors of the *Jeannette* who have recently returned from Siberia, and they find that no modification is necessary in the conclusions reported on February 12, 1883.

In the Star-route trial, just before the evidence in rebuttal was closed, Judge Julius B. Bissell, of Leadville, Col., testified that he had seen a check drawn by S. W. Dorsey to the order of "J. B. B.," or bearer. The amount was about $2,000, and it was to be divided among four gentlemen. John A. Walsh was called by the prosecution on Wednesday to testify in regard to the Price drafts, and the testimony was excluded as irrelevant. This closed the case as far as the hearing of witnesses was concerned. On Thursday the Court decided that in view of the unusual number of counsel for the defence, the Government should have as many opening arguments as it wished, but that the closing argument should be confined to one speech by one counsel. Mr. Ker opened for the prosecution, continuing his analysis of Brady's testimony throughout Friday, pointing out its inconsistencies. Monday and Tuesday, the third and fourth days of Mr. Ker's argument, passed without incident.

The Grand Jury at Washington on Wednesday returned an indictment against William Pitt Kellogg for receiving money while a United States Senator for services rendered in relation to a contract with the United States, and one against Thomas J. Brady for receiving money while Second Assistant Postmaster-General for services rendered in relation to a contract with the United States. Mr. Kellogg has given $10,000 bail to appear to answer the indictments.

The National Academy of Sciences, in session at Washington on Wednesday, elected Prof. O. C. Marsh, of Yale College, President to fill the vacancy caused by the death of Professor Rogers. Under the auspices of the Academy, the statue of Professor Joseph Henry was unveiled on Thursday, President Porter, of Yale, delivering an oration. The Academy adjourned on Friday afternoon to meet at New Haven on November 13.

Senator Anthony, of Rhode Island, is seriously ill with uræmic poisoning.

At a meeting of the New York Academy of Medicine on Thursday evening resolutions were introduced by Dr. Austin Flint, jr., and, after a stormy discussion, adopted, declaring that no physician known to be opposed to the old system of medical ethics, which forbade consultations with homœopaths, should be eligible in future as a resident Fellow. The vote was 58 to 25, and among the minority were a number of physicians of the highest professional standing.

The Railroad Commissioners of this State on Thursday submitted their report to the Legislature on the elevated railroads, relative to the cost of construction, the amount of capital, and the feasibility of their carrying passengers for five cents. There are two reports, one signed by Commissioners Kernan and Rogers, the other by Commissioner O'Donnell. The majority report finds that it is impracticable to reduce the fare to five cents, while the minority arrives at substantially the same conclusion. Mr. O'Donnell, however, submits with his report two bills, one extending the commission hours from 4 to 10 A. M. and from 3 to 9 P. M., during which fares shall be five cents. The other directs the Railroad Commissioners to proceed as soon as possible to examine and ascertain the cash capital and actual expenses in constructing and equipping each of the surface railroads in the State.

The Senate, at Albany, on Wednesday passed the bill establishing a Bureau of Labor Statistics under one commissioner; also, the Niagara Falls Park Bill, by a vote of 19 to 10. In the Assembly there was a warm discussion of the Butts bill, dealing with prison labor. It substitutes the "public account" system for the present contract system, and was amended so as to apply to penitentiaries as well as State prisons, but not to reformatories, except the one at Elmira. It was passed as amended, by a vote of 74 to 44. On Thursday the Senate passed the bill to make uniform the fees of county clerks, and the bill submitting to the people at the next general election the proposition to abolish contract labor from the prisons of the State. Governor Cleveland having made known to members of the Legislature that he could not sign the Excise Bill as it had been sent to him, the Assembly on Thursday, in accordance with his suggestions, so amended the bill as to repeal the three-bed clause of the act of 1857, and to prevent changing the location of a license without the consent of the Excise Commissioners. In the Senate on Friday Mr. Boyd, from the special committee appointed to investigate dealings in "corners" and "futures," presented a report, with the testimony taken. They recommend that a tax should be laid upon certain sales for future delivery, to be collected at the time of settlement in all cases where an actual delivery does not take place; and declare that bona-fide sales of merchandise for future delivery are lawful and beneficial when there is evidence that it is the intent of the contracting parties to deliver and receive the property sold and bought; further, that "puts" and "calls" and bucket-shop operations are gambling transactions and should be treated accordingly. Bills were introduced to carry out the recommendations of the Committee. On Monday evening the Senate passed the Primary Election Bill, so amended as to make it apply to all cities in the State. The Assembly at once accepted the amendments, and the bill has gone to the Governor. The bill allowing women to vote at all elections had its enacting clause stricken out on Tuesday in the Senate. The Assembly on Tuesday passed the bill regulating the duties of pawnbrokers in cities of more than 300,000 inhabitants.

The centennial anniversary of the issuing of General Washington's order announcing the cessation of hostilities in the war of the Revolution was observed at Newburgh, N. Y., on Thursday.

Governor Butler, of Massachusetts, on Monday sent an order to the State Board of Health instructing them to assume immediately all the powers and duties of the Board of Trustees of the State Almshouse at Tewksbury. He requests the Board of Health to appoint some officer to take charge of the Tewksbury buildings, and states that the name of Frank B. Sanborn would be acceptable to him. This is an outcome of the pending investigation into abuses at that institution.

A constitutional prohibitory amendment was defeated in the Pennsylvania House of Representatives on Friday when it came up for a third reading.

The Iowa Supreme Court on the rehearing has again declared the prohibition amendment null and void.

The total wheat acreage in Minnesota in 1882 was 2,572,000, while this year it is estimated that it will be 2,500,000. In Dakota last year the acreage was 850,000, which this year will be increased to 1,600,000, and it is estimated that this will swell the total crop to fully 24,000,000 bushels, as compared with 12,000,000 bushels in 1882.

A trading party of British Indians, the Crees, having crossed the border into Montana, and stolen stock, were pursued by a United States cavalry company and severely punished on Thursday. Their leader was killed.

General Crook, with 200 Apache scouts and one company of cavalry, is coöperating with the Mexican troops against hostile Indians in Arizona and across the border.

Terrible storms prevailed in the South and West on Sunday. A cyclone visited Wesson and Beauregard, Miss., towns about one mile apart, on Sunday afternoon, destroying about two hundred houses, eighty-three lives, and wounding more than 300 persons. The suffering is very great. West Point, Miss., was struck by a gale on the same afternoon, and many important buildings were wrecked. A tornado passed over the Maple River Valley, of Iowa, in the evening, blowing down houses and wrecking a church. Damage to the extent of $10,000 was done by the storm

at Chattanooga, Tenn. Snow prevailed in Orange County, N. Y., on Monday. The losses by the storm in Georgia on Monday will reach $1,000,000. Many lives were lost.

FOREIGN.

Norman, Dalton, Willson, Dr. Gallagher, Bernard Gallagher, Curtin, Ansburghe, and Whitehead, the eight men arrested on charges of being concerned in a dynamite conspiracy, were again brought up in the Bow Street Police Court, London, on Thursday morning. On being arraigned, it was announced that Norman had turned informer. The rest of the prisoners were formally charged with treason-felony. Norman, on being called to the stand, testified that his real name was William Joseph Lynch, and that he was born of Irish parents, in the State of New York. He swore that he worked in October last at a coach-builder's in Brooklyn. At that time he joined a secret society in New York called the Emerald Club, the object of which was to free Ireland by force. The hall was situated on the corner of Second Street and the Bowery. Members were selected to go on missions. He (Lynch) was sent to Dr. Thomas Gallagher, who lived at Greenpoint, Long Island, where he learned that he was to go to London—he would know what for when he got there. Gallagher gave him $50, and told him to take passage by the steamer *Spain* under the name of Norman. Afterward, he gave him $100 more and a small box. He examined the latter on board the steamer, and finding that it contained a spring which worked by pressure, he threw it into the sea. Lynch reached London on March 23, where he met Gallagher in about a week. They walked past the scene of the Westminster explosion. On his asking Gallagher if "that's what we are going to do?" the latter answered "Yes." Gallagher viewed the Houses of Parliament and said, "They will make a great crash when they come down." Lynch inferred from the talk of his co-conspirators that O'Donovan Rossa was in the scheme. He related the details of his visit to Whitehead's factory at Birmingham, and his getting the rubber bags filled with nitroglycerine. The hearing was continued on Friday, when Lynch's testimony was confirmed in many points by a boy employed by Whitehead at Birmingham, a waiter, and a cabman of the same city. A further hearing was put down for Thursday next.

Lynch's confession created considerable excitement among the Irish in this city. A member of the Emerald Club said the story was substantially true. The Emerald is only one of more than 100 similar clubs scattered throughout the country. They are subsidiary clubs of the Clan-na-Gael Society. The clubs are governed by executive committees who select the men to go on missions. Dr. Gallagher was highly respected at Greenpoint. He was graduated from the Bellevue Medical College.

Bernard Gallagher, a brother of Thomas, asserts that he was ignorant of the latter's business, that he is not a Fenian, and that he was in Sing Sing, N. Y., at the time of the Glasgow explosion, with causing which he is charged.

An explosion occurred on Sunday at the Government manufactory of small arms at Enfield, England. Owing to the open situation of the place little damage was done. Just before the explosion two men were seen to decamp with a box.

Featherstone, O'Herlihy, Morgan, and Carmody, charged with complicity in the dynamite conspiracy, were arraigned at Cork on Friday. It was reported on Monday that Featherstone's real name is Edward O'Brien Kennedy, and that he had turned informer.

The trial of Daniel Curley at Dublin for participation in the murder of Lord Frederick Cavendish and Mr. Burke was brought to a close on Wednesday with the arguments of counsel and the Judge's charge. The jury were out but a short time, and returned with a verdict of guilty. Curley was then sentenced to be hanged on May 18. Before sentence he admitted he was an Invincible and a Fenian, but declared his innocence of the murder. As he left the dock he cried out: "God save Ireland."

Timothy Kelly was placed on trial, on the same charge, Thursday morning, and the testimony for the prosecution was mostly a repetition of that given in the cases of Brady and Curley. The defence was an attempt to prove an alibi. The case was given to the jury on Friday afternoon, and they announced after a short time that they could not agree. They were discharged. It is said that one of the jurors wanted more proof of Kelly's presence in Phœnix Park at the time of the murder. Kelly was remanded, and the second trial was begun on Monday. On Tuesday fifteen witnesses testified in favor of his claim of an alibi.

The London *Times* of Monday asserted that the Government have obtained information in the course of recent inquiries that the enrolled members of the Fenian organization in the United Kingdom number 150,000, and that there are besides distinct offshoots of Fenianism, such as the Vigilants and the Invincibles.

In the House of Commons on Monday afternoon Mr. Bourke, Conservative, gave notice that he would question the Government as to whether any steps had been taken by the authorities at Washington relative to the conspiracies against England alleged to have been organized in America by members of the Irish dynamite party. On Tuesday Mr. Gladstone said it was inexpedient to make any reply at present.

A man named Eugene Kingston, supposed to be an Invincible, and one of the Phœnix Park conspirators, was arrested at Liverpool on Wednesday. He was arraigned at Dublin on Friday, and remanded to answer a charge of conspiracy to murder.

Mr. Parnell has tacitly admitted, it is said, that the Explosives Bill made it at least imprudent for him to attend the Philadelphia Convention of Irishmen. Sir William Harcourt, the mover of the bill, is reported to have said that the Explosives Bill would do more to disarm the Irish in America than all else that had ever been done in that direction by the British Government.

Owing to the receipt in Dublin, on Saturday, of private information of contemplated misdeeds by lawless persons, policemen, armed with swords and revolvers, were placed in the Central Postal Telegraph, the Excise, and the Customs offices.

The Parliament House at Quebec was burned on Thursday evening, and the deed is attributed to Fenians. About one-third of a valuable library of 30,000 volumes was saved.

Three thousand emigrants sailed from Liverpool on Thursday for the United States and Canada.

Negotiations have been in progress in London for some time to effect a consolidation of the interests of the Canadian Pacific and Grand Trunk Railways, of Canada. They seemed to be going on favorably, when on Wednesday a sudden rupture, owing to objections raised in America, was announced.

Lord Coleridge, Lord Chief Justice of England, has rendered a decision in favor of Mr. Charles Bradlaugh in an action brought by that gentleman against Mr. Newdegate, member of Parliament for North Warwickshire, for maintaining the suit of Mr. Clarke against Mr. Bradlaugh in regard to the latter's sitting and voting in the House of Commons without taking the oath of allegiance.

The French Chamber of Deputies on Tuesday, by a vote of 400 to 107, adopted the bill providing for the conversion of the 5 per cent. rentes into 4½ per cents.

In the French Chamber of Deputies on Thursday, M. Challemel-Lacour, Minister of Foreign Affairs, presented the draft of a convention concluded between France and the United States fixing the indemnity for losses sustained by French subjects during the civil war in America.

A copyright convention has been signed between Germany and France.

It is asserted in Paris that the object of the alliance between Germany, Austria, and Italy is to secure the isolation of France in order to effect a simultaneous disarmament, which Prince Bismarck intends to propose at a European congress.

The Berlin *North German Gazette* (Bismarck's organ), replying to comments of the French press on an article which it published recently, says that if the monarchy should be restored in France it is not very likely that Germany would declare war against the former country forthwith. She would probably await an attack by France.

Advices from Tamatav, Madagascar, assert that the natives are busily engaged in making weapons. They declare that they will not surrender an inch of territory to the French invaders.

The London *Daily News* says that in the event of the affair with Annam involving France in a war with China, it is understood that she will confine herself to blockading Chinese ports, as she is very well aware of the difficulties of an expedition to Pekin. It was reported on Thursday that a Chinese war squadron had been ordered to cruise in the Tonquin River.

Jules Sandeau, the French novelist and Academician, died on Tuesday at the age of seventy-two. He was the literary partner of Mme. Dudevant in writing the novel 'Rose et Blanche,' which appeared under the name of "Jules Sand." When a second novel appeared, 'Indiana,' which was the work of Mme. Dudevant alone, the name of "Sand" was preserved, but the Christian name changed to "George."

Louise Michel has been committed for trial at the next Paris Assizes, on a charge of inciting to riot. She will conduct her own defence.

Prince Krapotkine, who with several other persons was some time ago convicted at Lyons, France, of Nihilism and sentenced to prison, is seriously ill.

Several more Nihilist leaders have been arrested at St. Petersburg. The trial of eighteen prominent Nihilists was concluded in that city on Thursday. All were convicted, six sentenced to death (two of whom were executed on Sunday), two to life-long servitude, and the remainder to varying terms of imprisonment.

The Emperor and Empress of Russia will reach Moscow on the 21st of May, and the coronation will take place on the 27th. The festivities, which include eight grand balls, will be prolonged until the 8th of June. The state entry into the city of St. Petersburg will be made on the 10th of that month.

Suleiman Pasha, the famous Turkish soldier, died on Saturday at the age of forty-three. He gained notoriety from his fierce struggle at Shipka Pass during the war with Russia in 1877. In October of that year he succeeded Mehemet Ali as Commander-in-Chief of the Turkish armies. He met with reverses, was tried for high treason, and, after a long trial, in which he brilliantly conducted his own defence, was deprived of his rank and transported for fifteen years.

The Crown Prince of Germany on Monday left Berlin for Italy to seek a change of air for his health.

Herr Jauner, late director of the Ring Theatre, Vienna, who was imprisoned for criminal negligence in connection with that disaster, has been pardoned by the Emperor of Austria, having served half his term.

A report was received from Cairo on Saturday that the False Prophet had captured the town of Khartum, in the Sudan.

WHAT CAN OUR GOVERNMENT DO ABOUT IRISH DYNAMITE?

THERE is some danger that the very natural and proper denunciations of the dynamite operations of the Irish malcontents by the American press may deceive Englishmen as to what this Government is likely to do or can do to prevent them. It is all the more important that there should be no mistake on this point because, as the English public now for the first time fully perceives, the long-standing quarrel between Ireland and England has been fully transferred to American soil, and is likely to be carried on as long as it lasts mainly from this side of the water. It is this fact which makes the present Irish crisis so much graver than any former one. All former violent manifestations of Irish discontent have easily been suppressed by the passage of a coercion bill and the despatch of troops to the island. This would have been sufficient, even if the people had not been so poor and so wanting in leaders as they always were. It is now discovered for the first time that the old means of repression are not sufficient; that Ireland may be completely in the grasp of the officers of the law, and the capital of the empire and the Imperial Parliament be all the while in a state of not unwarrantable and panicky dread of Irish violence. This is an absolutely new situation, and one that is likely to last a good while, and it is not surprising that the British public should expect American help in obtaining deliverance from it, and should be disposed to put some of the responsibility for it on American shoulders. It is not surprising either that some of our newspapers, in their disgust over the performances of the dynamite men, should seem to promise some kind of relief from this quarter. It may therefore be worth while to consider what the real outlook as regards prevention here is.

We presume there is no doubt that this Government would do its duty under the treaty, at any cost, by surrendering any person proved guilty of one of the crimes enumerated in the extradition treaty of 1842. But, as we have already frequently pointed out, this treaty has to be interpreted subject to the understood exception in favor of persons charged with political offences, which every free government is careful to uphold, and none more than Great Britain herself. This might put our State Department into a position of great difficulty in dealing with many cases in which offenders were charged with dynamitic offences on British soil. Such offences as blowing up public buildings are atrocious, undoubtedly, but they would unquestionably, in the case of the Irish, be extremely political, and in handing over persons accused of them the Secretary of State would be taking on himself a new and great responsibility, even if such offences were mentioned in the treaty, which they are not. There is, in fact, nothing in the treaty to warrant the surrender of a dynamite conspirator, unless his explosion happened to cause loss of life. But would loss of life so caused be murder as contemplated by the treaty? Would the Secretary of State take upon himself to decide that it was? Would any of our courts so decide? These are questions which nobody can as yet answer with any certainty. But the probabilities are that the extradition treaty gives our Government no power whatever to surrender dynamite men, even if their offence consisted in causing explosions on British soil, and even if it were not a political offence.

Supposing now that the powers of the Government under the treaty were acknowledged to be insufficient to prevent the United States being made the focus of conspiracies for the destruction of life and property in Great Britain, and that fresh legislation were declared necessary for the purpose, does any rational observer suppose there would be the slightest use in asking for it at the hands of the Democratic Congress which will have possession of the Government till 1885? Such an application would undoubtedly be met with derision in both houses. Nearly every Democratic member would greet it with a terrible speech containing an epitome of Irish history, and advising England to lay aside her pride and make terms with the estimable and long-suffering Irish people. In fact, supplements to the *Congressional Record* would have to be issued to accommodate the statesmen who would be eager to put on record their burning hatred of British tyranny and their sympathy with the Irish race, to which it would probably appear that nine-tenths of them belonged by descent.

Let us suppose, however, that an act were passed which would enable our Government to deal with dynamite conspiracies and projects. Such an act would only empower it to try the offenders in this country by jury. It would not authorize the President to hand persons over to the British Government to be tried in England or Ireland for crimes committed here. Suppose the needed proofs for an indictment were then forthcoming, and the indictment were found, we should then simply be at the opening of a political trial, one of the rarest proceedings in American history—one which has never come to any satisfactory conclusion, which the victorious North shrank from under circumstances of the strongest provocation at the close of the civil war, and which, whenever attempted, has shown signs from the very outset of degenerating into a farce. The empannelling of a jury to try such a case would probably take a month or two, if it were possible at all. Large numbers of the windiest "counsel" in the world would be retained in it. The judge would probably catch the contagion, and become as excited over it as the bar. The evidence for the defence would probably include proof of "six hundred years of wrong" against the "real prosecutor," the British aristocracy, who would be "unveiled" and dragged "into full view," and made to show his hideous countenance at least once a day during the trial. To say that it would take six months to get all the testimony in and argue the exceptions, without including the "summing up" of counsel on both sides, is a ridiculously low estimate. Our own belief is that the trial would last a year and a half, and would be the most uproarious and irrelevant judicial proceeding ever witnessed, and would end either in an acquittal or a disagreement of the jury, and in the shame and regret of every rational and sober-minded person on either side of the water.

In fact, it is impossible in the space at our command to give an adequate notion of the absurdity of supposing that Englishmen are likely to obtain protection against Irish dynamite from any process of American law. A great and, we fear, impassable chasm separates the honest indignation which the performances of O'Donovan Rossa and his confederates arouse in the American breast from their punishment or repression by American courts. This much ought to be said, in all candor, to English voters and publicists. The Irish question cannot be settled here. It must be settled in London, and it is for Englishmen to decide on what terms and through what means.

THE "CORNER" COMMITTEE ON "CORNERS."

THE "Corner" Committee of the Legislature have made their report, in which they divide corners into "accidental corners," resulting from fires, floods, or other operations of nature, which, they say, do no great harm, are temporary in their nature, and at any rate cannot be prevented, and "protective corners," which are made by persons who sell without intending to deliver unless the value falls below the price at which they have sold. What the Committee think of "protective corners," as regards their effect on the public, does not clearly appear, but it seems as if they had a low opinion of those who make them.

On "futures" the Committee are, on the whole, inclined to look with a lenient eye, and do not see their way to compelling merchants by law to deliver everything they sell, and to acquire possession of it before they sell it. In fact, they have discovered, after careful inquiry—

"that the system of buying and selling for future delivery, to use the words of a witness, 'is the invention of a great necessity, and has answered the needs so well and has helped to build up interior towns and large cities and mercantile exchanges so rapidly, that it is universally recognized as part of our great and growing commercial development.'

"But it has been urged that sales for future delivery cause violent fluctuations in values greater than those which occurred prior to their general introduction into commercial trading. This statement has not been substantiated, however. Indeed, the evidence tends to show that the effect is, to some extent, quite the reverse."

The Committee also examined the question whether, supposing "futures" to be on the whole useful or indispensable to commerce, there was not "gambling" in them. They were compelled to admit that there was occasionally, among the "young and inexperienced," who will over-trade and operate on margins and what not. The Committee is not, however, prepared to prohibit futures in order to stop gambling. Of the system of "puts" and "calls," as carried on in "bucket-shops" and such places, the report speaks in terms of crushing severity. It adds, however, that the existing laws, if enforced, would break up the bucket-shops and punish the operator in puts and calls, and it asks, therefore, with much solemnity, conceding it to be

"true that the operation of this system is attended with some objectionable features, would it be wise to abrogate or legislate out of existence the whole credit system because to the abuse of

it can be traced in a large measure the failures and misfortunes which so often overtake merchants and commercial institutions? Shall our code of legal ethics present this paradox, that merchandise may be sold and delivered to the purchaser upon the promise of future payment, and at the same time deny the right to sell merchandise for future delivery with payment to be made upon delivery? Should it not be the end and aim of legislation in this State to attract and encourage every influence and element that will establish and perpetuate the commercial interest of her commercial metropolis?"

We answer unhesitatingly that to abrogate or legislate out of existence our whole credit system, in order to put down bucket-shops, would be a very unwise step, and we thank the Committee on behalf of the commercial world for throwing the weight of their influence against it.

While greatly admiring the whole report, which we think is the most important that has appeared in any commercial community since that of the Bullion Committee, what we like best in it is the recommendations. The first is that a tax should be levied on all sales for future delivery, to be collected at the time of settlement if no delivery takes place. There is to be no tax, however, on purchase for future delivery, which is just as wicked as sale, and the Committee fails to point out how the tax is to be collected at the time of settlement. Settlement in such cases consists in handing over a check for the difference or in crediting or charging somebody in a current account. Would the Committee have all such settlements made before a notary public or the Sheriff? Was such a tax ever collected anywhere, or, in fact, proposed? Would it not be about as fruitful as a tax on sneezing in all cases where a person sneezes more than once at a time?

The Committee has got now to the point reached by the Illinois Legislature after ten years' experience of an attempt to put down futures and corners by law—that is, to the point of admitting that such attempts are idle, and ought not to be made by a commercial community. All excess in a thing which is harmless or useful in moderation is apt to be beyond the reach of law, and is pretty sure to be self-curing, if curable at all. No penalties on corners, or overtrading, or speculation which the wisdom of legislatures can devise are half so effective as those which result naturally from the practice itself to those engaged in it. The reason why commercial gambling, in fact, is so much reprobated by the world generally is that those who engage in it usually come to grief, and lose everything they possess—a punishment which the law would not decree and could not enforce.

THE MEDICAL WAR.

THE trouble between the "regular" and the "irregular" doctors over the Code of Ethics—in other words, over the propriety of allowing consultations with homœopaths—led to an exciting meeting of the New York Academy of Medicine on Thursday. The new code adopted by the State Medical Society allows such consultations, but there appears to be a question whether the action of that Society is binding on the New York Academy, or whether this institution is not still governed by the old-fashioned ethics. Accordingly resolutions were introduced on Thursday by Dr. Flint, and after a stormy discussion adopted, declaring that no physician known to be opposed to the old system should be eligible in future as a resident Fellow. The vote was 58 to 25, and among the minority were a number of physicians of the highest professional standing. The fact is, that, as all the proceedings of the various medical bodies during the past year show, the profession is divided in opinion as to the code; and this division of opinion is what strikes the layman in reading the accounts of the various meetings, rather than the success of one party or the other. Such a division means, of course, that instead of one code of ethics we shall probably now have two in use, in this State, at least; but it does not seem that they will differ in any point but one. The regulars insist on maintaining "the dignity of the profession" by forbidding consultations with homœopaths, while the irregulars insist on considering the interests of the sick simply, in all consultations.

It is not difficult to foresee how the affair will end. The new code must eventually triumph, because all the influences of the times are on its side. Nothing that the irregulars ask for involves in the smallest degree any concession of the claims of homœopathy to be considered a scientific method of treatment. Their amendment does not provide for the joint treatment of any case by an allopath and homœopath. It simply permits the allopath to give his opinion to any one who asks for it, and is willing to pay for it, without inquiring into his motives or character. It allows a regular physician to tell any sick person or his medical attendant what he thinks of the case, and to receive a fee for so doing. It binds him to no approval of the treatment previously pursued, for he may disapprove of it wholly. Those who ask for the opinion, in fact, indicate by their asking that they are doubtful about this treatment themselves, and think it not unlikely that he will disapprove of it. Their asking for it when the treatment has been homœopathic is, in fact, a concession to allopathy; and the most singular thing to us in the present discussion is that the regulars should not see it in this light, and encourage their members to go into consultation with homœopaths whenever the latter seek it. There is probably no other calling in which it would be considered improper for an orthodox practitioner to tell what he thought about his condition to a heretic or infidel who asked what he should do to be saved.

Physicians, as well as all other scientific men in our time, must come to regard themselves, not as bands of tradesmen, interested in keeping up the prices of their goods and discouraging competition, but as reservoirs of the best knowledge of the day, from which everybody is at liberty to draw. If homœopaths were absolute and recognized impostors, it would not constitute an excuse for refusing to tell a patient who had fallen into their hands what he should do to get well. On the contrary, the worse a regular thinks of homœopaths the more eager he ought to be to get access to the unfortunates who are under their treatment. If his advice is taken, and the patient gets well under it, the result is a victory for orthodox medicine and a defeat for what he considers quackery. If it is not taken, the patient is no worse off than he was, and the regular physician is better off by the amount of his fee. The quarrel, in fact, reminds one of the Irish priest who complained much of the low moral condition of his flock, whose evil ways he was unable to restrain even by occasional horsewhipping. Being asked whether he had ever tried the Gospel on them, he answered indignantly that "he was not going to waste good Gospel on the likes of 'em." In fact, the notion that there are classes of people so low and wicked that they are not even entitled to religious teaching, is hardly more ridiculous than the notion that there may be sick persons so deluded and gone astray that it would not be right for an orthodox doctor to tell them, even for a fee, what is the matter with them, and what will cure them—that homœopathy so degrades and dehumanizes them that a good allopath ought not to advise them to give it up.

THE EXPLOSION CONSPIRACIES AND THEIR EFFECT ON ENGLISH OPINION.

LONDON, April 10, 1883.

THE discoveries of persons concerned in the manufacture or carriage of explosives which have been made during the last few days are already as well known in America as in England, and need not be described in a letter which will not arrive till further discoveries, believed to have been already achieved, have been made public. The most noticeable result of these disclosures in England has been the composure with which they have been received. It might have been expected that when the people of Birmingham and London learned that there had existed in populous parts of both towns stocks of nitro-glycerine sufficient to destroy, had the least carelessness produced an explosion, thousands of homes and tens of thousands of lives, and when at the same time there is every reason to think that the intention of those who made and carried about these dangerous substances was to destroy the public buildings of the capital, and therewith probably a great many lives, there would have been a panic of terror, followed by a panic of rage against the persons accused of such desperate crimes. However, the matter has been taken very coolly. Naturally, there is much curiosity; and much indignation is expressed in conversation and in the newspapers. But there have been no demonstrations of ferocity against the prisoners captured, no passionate cries for severe punishments. In London, people observed after the explosion at the Local Government Board offices, which took place at nine o'clock at night, that the moral of it was that Government clerks had better not stay late at their work; as on the announcement of Lady Florence Dixie's adventure they remarked that the moral of it was that ladies had better wear steel corsets.

In fact, the main feeling of the country seems to be one of surprise—surprise that toward the end of the nineteenth century, in a perfectly peaceful country, where no battle has been fought for over a century, and every class of the community has been supposed to be fairly contented, and certainly well affected toward the Government, outrages of this desperate kind should have been concocted, and even on a small scale carried out. People rub their eyes, so to speak, and ask themselves whether it can really be true that in London all the public buildings, not the Treasury only and the House of Commons, but Westminster Abbey and St. Paul's, should have to be watched by strong bodies of soldiers and police, while all the members of the Cabinet are guarded by policemen standing

sentinel at their doors, following them about in plain clothes, sleeping in their houses. "Are we in England at all," they say, "or is it in Russia that these things are happening?" In Birmingham, after Whitehead's manufactory of nitro-glycerine had been seized by the police, the danger of a tremendous explosion was so great during the three or four days that elapsed before the dangerous substances could be removed and destroyed that many of the inhabitants carried off their families from the neighborhood and left their houses empty. Yesterday Parliament, suspending the standing orders, passed through all its stages in both houses a bill increasing the penalties for the possession of explosives under suspicious circumstances, and rendering more stringent the procedure for discovery by the police and for judicial inquiry. This, however, was done in the coolest and quietest manner. No one denied that some such measure was needed in the extremely loose state of our law on the subject; and the temptation to make the penalties retrospective, so as to strike heavily at the persons already arrested, in the event of conviction, was resisted. There has been no panic anywhere, and, what is even more remarkable, there has been hardly any denunciation of Ireland and the Irish. One or two newspapers, and especially the *Times*, have shown a tendency that way, but they have not been followed either by the press generally or by opinion as one hears it from private persons. Doubtless many people think the Irish even more reckless and fierce, even more capable of terrible mischief than they thought them before. But it has been felt that the crimes of a small minority ought not to be charged on a whole people; and although it is often remarked that the Parliamentary agitators must bear the blame of having raised the storm—of having taught, or seemed to teach, that lawless means may be used to attain political ends—of having failed to denounce agrarian murders and outrages when they were most rife—still the difference between these latest plots and all previous crime is so considerable, and the injury to the interests of the Irish Nationalist party from such plots so patent, that there is less indignation against the Land-League leaders than an observer might have been inclined to predict. No one, I think, has accused them of any direct connection with the so-called dynamite faction.

What is the cause, then, of the coolness which England and Scotland have shown in such a crisis? Why has the national pulse not beaten perceptibly faster for the discovery of a tremendous danger, which might have cost thousands of lives and produced a fierce and lasting exasperation as serious as the loss of those lives? Without detracting from the credit which belongs to the national character, its soberness, its fairness, its conscious strength, we may assign some subordinate reasons which have operated at this particular conjuncture. One of these, and perhaps the most important, is the fact that so far no blood has been shed. Even a single death would have made a great difference to public feeling—would have rendered impossible that tendency to see the ludicrous side of a serious matter which the English have almost as generally as you in America, and which is foreign to the French nature. The death of even a few persons by an explosion would have given a fierceness to the temper of our people, and evoked a cry for vengeance which happily has not been heard. It is odd, but most fortunate, that the contrivers of the Local Government explosion should have placed their nitro-glycerine in almost the only place in this huge city where it could make a noise and damage a building without injuring a single person. Another cause is the promptitude and skill which have been shown by the police. They have proved themselves so capable of following up the first threads that fell into their hands that confidence was soon restored, and the element of mystery and darkness told less on men's imaginations. When a number of persons had been seized in different parts of the country, people felt as if the immediate risk was passed, concluding that, even if there were some other conspirators at large, they would not venture to carry out their designs at present, but would save themselves by flight. There is also the idea—whether well or ill founded does not yet appear—that this conspiracy is managed by a comparatively small knot of men, and is not backed by any sympathy, much less support, from any large number of Irishmen. Considering how large an Irish element there is in the population of all our great towns, and how likely they would be to suffer, partly by an explosion itself, partly by the wrath of the English and Scottish workmen as well as employers which would fall upon them, it is plain enough that few Irish on this side the ocean can wish success to the nitro-glycerinists. And perhaps one may even attribute something to the story about the attack on Lady Florence Dixie. Those who had at first assumed its truth, and been incensed at the notion of an attack by Irish ruffians on a defenceless woman, were ashamed of their precipitancy when no evidence appeared in support of her narrative, and have consequently been the more anxious to take, or seem to take, all subsequent disclosures with coolness.

On the whole, there is no reason to believe that so far these plots have seriously aggravated the difficulties of Irish policy. The good sense of the country has felt that the only motive which can be ascribed to the conspirators is a desire to irritate England (for of coercing her into granting Nationalist demands there can, of course, be no question), and that England is therefore bound, so far as she can, to disappoint and frustrate this malevolence by not confounding the innocent with the guilty in one outburst of wrath. Of course, this temper may not continue; things may be said and done which will widen the breach between the countries; but up to this writing there are no signs of grave mischief. Nor has anything vehement been said as to the toleration extended to the so-called "dynamite wing" in America. People know how that party is regarded there, and know also what the maxims of American policy as regards indulgence to such persons have hitherto been. At the same time, there is a good deal of unexpressed regret, and even annoyance, that this indulgence should have gone so far. The remark is made that indulgence emboldens people to crime, and that conspiracies which propose to destroy any number of innocent private citizens in "skirmishing" against a government, are, after all, widely different from the conspiracies that were carried on from London against the tyrants of Italy.

Other subjects of interest have been thrown into the shade by these events, and the interest felt in the measures brought forward by the Government is for the moment languid. Some amusement has, however, been created by the efforts of Lord Randolph Churchill to procure the deposition of Sir Stafford Northcote from the leadership of the Conservative party. It was at first supposed that he was the mouthpiece of a widely-spread discontent. But his letters to the *Times* on the subject have had no effect but to stimulate the previously rather half-hearted loyalty of the Tory party in the House of Commons to its leader, and he seems likely to retain his office in peace. No one of superior abilities, and certainly no one of at all similar experience, can be named for it; nor is it at present a post to be greatly desired. Y.

EDWIN BOOTH IN GERMANY.

LEIPZIG, March 22, 1883.

As the first representative of the American stage who has returned the visits of numerous German artists to our shores, Edwin Booth, apart from his fame as tragedian, has been the object of marked attention and close scrutiny since his début in the Residenztheater in Berlin. A "starring" tour was surely never made with more freedom from ostentation, and less employment of advertising puffs, than this. Such means of attracting public attention, supposed to be peculiarly American, are, I am happy to say, totally neglected by the first American actor who has appeared before the German public. In the *Leipziger Tageblatt*, a newspaper otherwise filled with the gossip of the day, I found but a single brief paragraph on Booth before his representation of *Hamlet* in Leipzig on March 19. The theatre posters of the same date, as well as the theatre advertisements in the newspapers, contained nothing beyond the usual laconic announcement (not even in full-faced type, as is generally the case): "Erste Gastdarstellung des Herrn Edwin Booth—Hamlet ***—*** Herr Edwin Booth." Nevertheless, for the three evenings on which he played in Leipzig, every seat in the Stadttheater not occupied by the regular subscription audience could have been sold twice over. The genuine enthusiasm manifested by all educated Germany for Shakspere's works—an enthusiasm to which the celebrated Meiningen troupe in great measure owes its organization and present degree of perfection—together with the natural interest felt by the English-American colony, sufficed to fill the theatre to overflowing.

I was able to attend but one performance, that of "Othello," on March 20. That hush of profound attention which is such a delightful characteristic of German audiences seemed intensified as, after the first change of scene, *Othello* was about to make his appearance. One might have heard a pin drop as he, accompanied by *Iago* and attendants, strode upon the stage. And this air of eager attention was his only welcome—not a hand was raised to applaud him among the relatively small American contingent (a piece of tact, by the way, worthy of commendation). The German portion of the audience, coolly critical, likewise remained passive. *Iago* opens the dialogue in sonorous, melodiously guttural German, ending with the words:

". . . Zwanzig Mal
Dacht' ich, ihm mit 'nem Rippenstoss zu dienen!"

Othello answers, in dry, nervously clipped English:

"'Tis better as it is."

The thrill caused by these few unimportant words is more easily imagined than described.

The English language has been so persistently decried as the most unmusical, and more particularly as the least adapted for song, of ancient or modern times, that a very general impression (which I confess I have always shared) prevails that it is almost entirely unsuited for musical-dramatic uses. Booth's delivery of certain passages has done much to weaken this prejudice as far as I am personally concerned. The lines,

". . . If it were now to die,
'Twere now to be most happy; for, I fear,
My soul hath her content so absolute
That not another comfort like to this
Succeeds in unknown fate,"

were spoken with a truly melodious pathos which was to me like a revelation of previously undreamt-of musical possibilities. It must be regarded as peculiarly fortunate that the first interpreter of the English Shakspere in Germany

should be an actor of the old school, having such a wonderfully clear, musical pronunciation; the modern English, as it is generally spoken (or *in*-articulated), would have sounded, as alternating with the full and rounded diction of the German stage, like the rustling of dry husks amid a forest symphony. If ever a poet-musician arise in America, he will choose, as did Wagner in German, with the intuition of genius, only such words as are eminently adapted to the uses of the musical drama, and, I am persuaded, with a most happy result. To be sure, the singers will be obliged to submit to a vigorous course of training in a new style like that which Wagner's singers have gone through—a training as severe as that which has made the name of Booth famous for nearly two centuries.

At the close of the second act, the Germans again showed their determination not to let a foreign celebrity be forced upon them, the faint applause being quickly stifled by the customary counter-demonstrations. The third act, however, which is generally regarded as the touchstone of the actor's quality, met with a quite different reception: the whole audience seemed to be carried away by enthusiasm, expressed in a whirlwind of "bravos" and clapping of hands (stamping with the feet and pounding the floor with canes are not tolerated in a cultivated German audience). I say "seemed" advisedly. A local critic, in writing on Booth's representation of *Hamlet*, had been profuse in his praise, saying, "The transatlantic actor has this advantage over the German performer of *Hamlet*, that he is not bewildered by a multitude of commentaries, which in Germany spring up like fungi out of the ground. . . . This *Hamlet* was a portrayal of character such as would render a hundred commentaries superfluous; for in this symmetrical, consistent representation all the contradictions which alarm the conscience of the critical expositor were reconciled." I strongly suspect that he felt, on reading these remarks in print the day after they were penned, that he had gone too far in his commendation of foreign methods and his tacit condemnation of German "Shakspere literature." Now, in casting about for a "but," he appears to have remembered that, in his criticism of Booth's *Hamlet*, he had hinted that in respect to the "whirlwind of passion" this performance had somewhat fallen short of his expectations (*e. g.*, in the burial scene). Thus he says:

"In spite of the correct portrayal of this development [of jealous passion], we nevertheless missed, on the whole, that elementary ferocity which should break loose after *Othello's* African nature is once aroused. Edwin Booth remained simply a passionate European, reminding us of his tropical temperament only through the sad wailings of the child of nature. But when the restraints imposed by the spirit of civilization and the power of self-control are once broken down, a flood of passion must burst forth carrying everything before it, and the fierce instinct of the race must have full scope."

This certainly means, if it mean anything, that the critic desires to see a real live African savage on the stage. "The murder scene also appeared to us to be given with too great moderation. . . . Edwin Booth seemed too much like a sacrificial priest." Please imagine the critic's savage let loose to do murder: a very slight degree of reflection will suffice to convince one that *such* a murder would be not merely horrible and revolting—the murder of *Desdemona*, even with Booth's careful treatment, remains that in any case—but *disgusting*. Could such a murder produce the desired effect of the tragedy? Even our critic admits that, on purely technical grounds, this moderation on Booth's part was deserving of praise, inasmuch as the last scene, which might otherwise appear tame, gains largely in tragic effect and deep meaning.

From the *Börsenzeitung*, a Berlin paper whose criticisms may be considered as fairly representing the tone of the press of the German capital, is taken the following notice of Booth's appearance in the rôle of *Othello*, on February 28:

"On Tuesday last Edwin Booth appeared in the Residenztheater as *Othello*, and excited a storm of enthusiasm among the large audience there assembled. The 'Moor of Venice' is by far the grandest rôle in the répertoire which the American tragedian has as yet performed in Berlin [it was preceded by *Hamlet*, *King Lear*, and *Iago*]—admirable in its unity of conception, of wonderfully soulful depth, of fascinating originality in delineation of character, and of an unaffected nobility of bearing which gained and moved every heart. In this *Othello* was personified, not the wild African, the negro, but the noble Moor, reminding us of the sheikhs and emirs of the desert—those wonderful personages of whose knightly traits and greatness of soul so many legendary tales are told. Edwin Booth was probably influenced in his adoption of this most attractive conception not alone by his eminently artistic inclination to mould all his characters in accordance with his inmost feeling, and to divest them as far as possible of mere theatrical accessories, but also by that dislike of the negro in which the American is brought up. The fact that the black coloring conceals to a great extent the play of the features, this most potent means of expression at the player's command, may also have been of weight. And the color is, after all, of but secondary and outward importance; the main point is the representation of *Othello's* flaming temperament, and passionate, tempest-tossed soul. And in those scenes in which Edwin Booth saw fit to sink the 'noble Moor' in the ferocity of the jaguar, he solved this problem with overpowering grandeur. He foregoes from the very beginning any attempt to depict a series of elementary outbursts of fury, such as ripen under an equatorial sun; he delineates the lofty spirit of the Venetian general in its conflicts with the innate propensities of the beast of prey, the mastery of an exalted mind over blood boiling up volcanically, a man of iron self-control. In the first two acts he preserved the imposing calm of the Oriental; only now and then a lightning-flash of passion passed over his countenance, and one felt why the Doge calls him the 'noble' Moor. In the third act he presented, with a grandeur which has scarcely ever been equalled, the wonderfully affecting spectacle of a magnanimous and lofty mind contending against the most impetuous outbreaks of the blood and all the demons of passion—and conquering them. The scene with *Iago* is unique in histrionic art. As in *Othello's* breast, at the thought that his ancient might be deceiving him, and himself be doing *Desdemona* wrong, the inborn jaguar-nature is awakened; as it gradually takes possession of him, for an instant overpowers him, and he, with lightning-like rapidity, hurls *Iago* to the ground, draws his dagger, and then, abruptly recovering himself, struggles with the thirst for vengeance and blood which had seized him with demoniac might—that is a moment which cannot be described, but must be seen. . . . With the third act the height of the outward effect is reached. According to Booth's conception of the part, *Othello's* self is unhinged so long as he is tortured by uncertainty; but as soon as he believes himself assured of *Desdemona's* guilt, he gains the mastery over his raging blood. We no longer see the flames devouring his heart and soul—we witness only the immensity of his pain and of his love. His soul is troubled unto death, and he carries out the smothering of *Desdemona* not, like other actors, at an instant when the brute is aroused in him, but with a breaking heart. The numerous foreign traits by means of which he characterizes the Moor, the heathen, lend to this conception of *Othello* a peculiar charm. His gestures, his manner of handling his weapons, his salutations and commands, all his movements, betray the Oriental, the warrior of the desert. We see before us a being from another zone. One feature only made a somewhat disturbing impression upon our taste—that Booth too frequently employs inarticulate wailings and whimpering tones. We of Central Europe are accustomed to the dumb rather than to the audible expression of pain."

That the judgment of the audience coincided with the spirit of this latter criticism rather than with the other was evident, Booth being enthusiastically recalled five times at the close of the tragedy. The support was here far above the average of that usually offered to the American public when a "star" condescends to shine upon it; *Iago* (Herr Grube) and *Emilia* (Frau Senger) left but little to be desired, and the *ensemble*, despite the disturbing influence of the foreign tongue, was a good one. The opinion as to the unpleasant or disturbing effect produced by the mingling of English and German appears to vary according to the facility with which the several critics comprehend the former language as spoken on the stage—*e. g.*, our Leipzig reporter considers that such a "confusion of languages" does not permit of any entirety of impression, whereas the Berlin critic found that it neither embarrassed his comprehension nor lessened his enjoyment of the drama.

Respecting the total impression made by Booth's acting, it is interesting to notice the change which took place in the Berlin critic's views. Booth's remarkable powers of endurance (while playing in "Hamlet" every evening till eleven o'clock he punctually attended rehearsals of four hours' duration each morning) had excited his admiration. In seeking an explanation for such extraordinary energy, he compared Booth with Ludwig, the Berlin *Hamlet*, a man whose fresh and vigorous appearance presents a striking contrast to the nervous-looking American, and from this comparison draws the following conclusions: "We have here a noteworthy instance of the difference between these two *Hamlet* performers in point of nationality. . . . Ludwig feels more deeply, in conformity with his German nature and descent, therefore the rôle of *Hamlet* exhausts him: Booth has a more complete mastery of dramatic routine and method, and, standing outside of and above himself, pulls the wires of the puppets, to which his outward expressions of emotion are degraded, with critical repose, in order to attain the desired end." And this same critic writes, at the close of Booth's representations in Berlin: "He is adapted like but few to be held up as a model for imitation, for he moulds his characters, not in his head, but in the depths of his soul." He frankly admits having been prejudiced against English and American actors, and in these closing remarks as frankly avows his unqualified admiration of Booth's genius.

All criticisms agree in praising Booth's consistency in the delineation of character; his perfect command of dramatic routine, united with a grand simplicity which despises mere outward effect; and the remarkable power with which the true effect is increased from act to act up to the final catastrophe. In general they wisely refrain from analyzing his pronunciation and mode of delivery. His conception of some parts, on the other hand, has given rise to unfavorable comment, of which our Leipzig critic furnishes a fair specimen, he taking special exception to Booth's rendering of *King Lear*. While granting that this representation, like those preceding it, was thoroughly consistent, every detail being subordinated to the total effect and elaborated with a masterly finish but rarely met with among German actors, he found this *King Lear*,

"from the very beginning, too infirm with age, too broken. Even though his behavior toward his daughters be childish, as proceeding from senile caprice, still this *King Lear*, according to the poet's intention, is at first a robust old man, heroic, defiant, with mighty outbursts of wrath, a majestic mythical figure. The others refer to his natural air of command; he himself, in his insanity, cries out: 'Ay, every inch a king!' From that Jupiter by whom he so often swears a reflection of imperious grandeur should fall upon him, . . . and this we missed in Edwin Booth. Shakspere has clothed the speech of this king, in the thunder-storm on the heath, with the sublimest poetical pathos; here we de-

mand a grander power of expression—the full sublimity of the tragedy must here be revealed. As in the throne scene and in the scenes with *Goneril* and *Regan*, the outbreaks of passion must be more fulminant, more imposing. In Booth's *Lear* the imperial deportment was wanting; he was the grieved *pater-familias* of the domestic drama, done, with some slight nuances, into tragedy; moving and affecting in a high degree, worked out in each detail with a complete mastery of dramatic technicalities, but not the kingly *Lear* who appears like a lion shaking his mane before his daughters."

This is decidedly the sharpest criticism of Booth's power of conception or manner of rendering that I have seen, and is perhaps not entirely unreasonable as far as the *manner* is concerned in this individual case. However, it being a well-known fact that there are nearly as many diverse opinions in Germany concerning the conception of Shakspere's principal characters as there are commentators on the same (and their name is legion), it is not very surprising that Booth could not suit them all. That precisely in the rôle of *Hamlet* he should have met with universal approval, is a fact worthy of note; and, in view of the genuine and overwhelming success which is attending his tour in Germany, Edwin Booth can afford to snap his fingers at those who are "nothing if not critical." T. B.

Correspondence.

PROTECTION AND LOW WAGES.

To the Editor of The Nation:

Sir: The tariff in Italy is the highest in Europe, if not in the world. There is no country in the civilized world in which wages are so low and the terms of labor so hard as in Italy. In an Italian town in which I am staying, masons are at work at a church opposite to my hotel. The masons are excellent and skilful workmen. They receive, on an average, 90 cents a day, and they work from 6 A. M. to 7 P. M., with one hour's intermission. Yet the tariff is so high that cotton cloth which we make and sell in Massachusetts at 5 cents a yard costs here 10 cents a yard, and wheat flour is so highly taxed as to place white bread out of the reach of the laboring classes. W.

San Remo, Italy, April 6, 1883.

UNIVERSITY HONOR.

To the Editor of The Nation:

Sir: I believe that Mr. Plimpton is probably right in saying, in your last issue, that there is more cheating in Northern than in Southern colleges. But I cannot concur in the extraordinary statement that "in the North the prevalence of cheating is such that one might say that there exists hardly any sentiment against it." I am sure that in the Northern college in which Mr. Plimpton and I pursued our undergraduate studies, this was not the case. On the contrary, the sentiment of the majority was strongly against such practices, though "personal violence" was of course never threatened or inflicted by them, either for that or for any other cause. It seems to Mr. Plimpton most extraordinary that either professors or students should leave the room during an examination. But I can now distinctly recall, at the Northern college which we both attended, at least two occasions on which the professor left the examination-room, and, so far as I know, in neither case did any one of the 80 or 100 students present take advantage of his absence. And, on the other hand, I never was refused permission to leave the room. Of an absence of several hours, indeed, I do not remember any instance; I imagine that the colleges are few in which such antediluvian leisure prevails at examination-time as this would imply.

Mr. Plimpton forgets that the greater part of the watching and of the cheating in Northern colleges takes place at the entrance examinations, when no *esprit de corps* has yet come into existence, while at the University of Virginia there are, if I remember, no entrance examinations. Very respectfully yours,

J. F. Jameson.

Johns Hopkins University, Baltimore, April 22, 1883.

"CONVICT INDEXING" AGAIN.

To the Editor of The Nation:

Sir: Probably Mr. Poole will accept the rôle of the elephant which Mr. Browne assigns him in your last issue, as in *that* little story the laugh is on the tailor rather than on the elephant. But, leaving aside the interesting question whether it is in Baltimore or in Chicago that the elephant is to be seen, I wish to beg the favor of a few lines in which to assure Mr. Browne that his former communication was not so "inoffensive" as he would like it to appear. Of course it's the galled jades that wince. Should the *Nation* print a "facetious" note, averring that the work of librarians is "fit only for old maids or decayed parsons," it is to be presumed that Mr. Browne's withers would not be altogether unwrung. No more can we, who have made indexing the field for the exercise of our best energies and efforts, and found in it ample scope for all our powers and all possible culture and scholarship, consider inoffensive the suggestion that it is mere hack-work, drudgery, convict labor.

But it is not the offensiveness to us indexers of such a suggestion that I would make most prominent, or ask your space to point out. It is rather the fact that it voices one of the rankest literary heresies of the age—namely, the idea that anybody can make an index, if he only knows the alphabet. The *Nation* could nowise better serve the book-users of this day and generation than by doing its best to root out this heresy, by exposing the results of "convict indexing" as shown in the many published indexes made on the hack-work plan. May I add three instances lately noticed? The index to *Scribner's Monthly* (vols. i.-x.) contains no reference to engraving, simply because the article in volume iv. is *called* "The Graphic Art." An important article in *Harper's Magazine* on Mexico is not cited in the index (vols. i.-xl.) under Mexico, but only under Aztecs, because it is called "Land of the Aztecs." And, to cap the climax, an illustrated article on the East River Bridge, in *Appleton's Journal*, appears in the alphabetical index of the volume only under "Spiders, Up among the"!

The index to the *Popular Science Monthly* just issued by the publishers of that journal is from one end to the other a good example of "convict-indexing." Shall we, who rejoice in the character of professional indexes, take it kindly if we are asked to let the "convicts" take *all* indexing into their own hands? Rather shall we not magnify our office, and insist that such first-class literary work be no longer butchered by being put into the hands of hacks and drudges? W. I. F.

Hartford, Ct., April 23, 1883.

Notes.

Robert Clarke & Co. will publish in June the second volume of Dr. Brinton's "Library of Aboriginal American Literature," viz., 'The Iroquois Book of Rites,' original text and translation, edited with an introduction and notes by Horatio Hale. A map will accompany it, showing the location of the United Nations and the surrounding tribes.

Dodd, Mead & Co. will issue immediately an edition of the dramatic works of Richard Brinsley Sheridan, complete in three volumes, and limited to 350 copies, printed, 30 on Imperial Japanese paper, and the remainder on Holland paper; the size, post octavo. Mr. Richard Grant White will furnish a prefatory sketch of the author. Three portraits have been etched for this edition.

The limited *édition de luxe* of Emerson's works now in progress (Boston: Houghton, Mifflin & Co.) is reported by the publishers as mostly all subscribed for.

G. P. Putnam's Sons have nearly ready 'Authors and Publishers,' a manual of practical suggestions for literary novices. It will contain chapters on the human relation between authors and publishers, on their business approaches and bargains, on the law of copyright, on the openings in journalism, on advertising and placing, on the manufacture of books (beginning with the preparation of MS.), etc. The book will be illustrated.

Cupples, Upham & Co., successors to A. Williams & Co., Boston, announce for immediate publication an album of yacht pictures and sea-views, the work of Mr. David Mason Little, well known for his success in instantaneous photography. The volume will be a handsome quarto, bound in new and artistic style. The same house will issue shortly 'Mr. and Mrs. Morton,' a society novel, by a well-known Bostonian, and a new illustrated novel, 'The Priest and the Man.'

Ginn, Heath & Co. announce a "Library of Anglo-Saxon Poetry," edited by Prof. James A. Harrison in conjunction with Professor March and other scholars, and beginning with 'Beówulf'; a "Pedagogical Library," edited by Mr. G. Stanley Hall, and promising in the first volume a translation of Diesterweg's monograph on historiology, followed by independent contributions by six eminent American university teachers, with a bibliography by Prof. W. F. Allen; 'Extracts from Rousseau's Émile,' containing the principal elements of pedagogy found in the first three books, selected by Jules Steeg, and translated by Eleanor Worthington; 'Two Shakspere Examinations'—viz., at the Hollins Institute (Va.) for the annual prize offered by the New Shakspere Society of England—together with remarks on the class-room study of the poet, by Prof. Wm. Taylor Thom; 'History Topics,' and a supplement to the 'Reader's Guide to English History,' by Prof. W. F. Allen; and 'The Essentials of Latin Grammar,' by F. A. Blackburn.

According to the *Library*, of Cornell University, President White has in his possession the MS. of the protocol in the famous witchcraft trial, at Trier, of Dr. Dietrich Flade (1589), which ended in the burning of that magistrate. It is intended to publish this protocol in the original text, with critical and bibliographical notes.

The *Monthly Reference Lists* for April (New York: F. Leypoldt) has three topics: Washington Irving, in view of his centenary, Gustave Doré, and Washington's Administrations. This last begins a series "designed to facilitate the study of the successive volumes in the 'American Statesmen' series."

Apropos of the Note in the *Nation* for April 5, in regard to librarians and instruction to be given by them in the use of books, a correspondent at Ann Arbor writes that "at the University of Michigan the librarian has been in the habit, for

three years past, of giving stated lectures on bibliography to students that chose to attend, and, by special vote of the Board of Regents in June last, a regular elective course in bibliography was added to the list of studies open to candidates for the several literary degrees. Thirty six students are now pursuing this course under the instruction of the librarian."

Mr. James M. Hubbard, of Boston, whose efforts to purge the Public Library of that city of indecent literature—or, at all events, to keep it from being lent out to children—commanded the sympathy of all parents, has returned to the charge in "A Second Appeal." Mr. Hubbard here examines what has been done, or rather undone, by the trustees to weed out obnoxious fiction from the South End Branch—a branch officially pronounced a quite needless part of the system. His method is, as before, to cite the judgment of the best reviews upon the works he selects for condemnation. In doing this he conceals both titles and authors—a necessary manœuvre if children were directly addressed by the appeal, but rather calculated to weaken the effect of the exposure upon adults. However, this little pamphlet is sure to do good wherever circulated.

The Q. P. Index Annual for 1882 (Bangor, Maine) embraces twenty-two periodicals instead of nine, as last year, one being the *Deutsche Rundschau*. New features are a "necrology" (of *Potter's American Monthly* and the *Penn Monthly*), and two additions to the signs—a † to indicate an obituary notice, and BIBLIOG., which explains itself, except that the bibliographies referred to are chiefly those compiled by the Boston, Cornell, Harvard, and Providence libraries. The proprietors of the defunct magazines above named relate the history of their respective enterprises. Mr. Griswold can now survey no less than twelve of his indexes, each one of which is an apostle of the higher learning.

We have already noticed (*Nation*, No. 868) Bishop Thirlwall's 'Letters to a Friend' as edited by the late Dean Stanley. A neat American reprint of this interesting work has now been made by Roberts Bros., Boston. The letters run from 1864 to 1874, inclusive, and it is curious to observe their scanty reference to American affairs at a time when the world's eyes were fixed upon our great struggle.

Dr. O. W. Holmes's 'Medical Essays—1842–1882' (Boston: Houghton, Mifflin & Co.) opens with two lectures, of the former date, on "Homœopathy and its Kindred Delusions," which, like his views on eternal damnation, must still be unpalatable to a large and respectable class of the author's townsmen. In his new preface he would have done a good service by comparing the status of homœopathy now and forty years ago as accurately as may be: adding, perhaps, a comparison of the practices of the orthodox school at the two periods. The famous "Currents and Counter-Currents" is also to be found in this volume; and so are the "Border Lines of Knowledge in Some Provinces of Medical Science," with a notable autobiographic passage on phrenology, "The Contagiousness of Puerperal Fever," "The Medical Profession in Massachusetts," "Medical Libraries," "The Young Practitioner," etc.

Volumes vii. and viii. of the Riverside Edition of Hawthorne's Works embrace 'Our Old Home' and 'English Note-books,' or the finished product and the quarry of transatlantic observation. Perhaps as typical a piece of writing as can be found in these two volumes is Hawthorne's recollections of the monomaniac author of the Baconian theory of Shakspere. They read like a fragment of one of his novels, in which a character like Miss Bacon would have been entirely at home; and doubtless his consciousness of this heightened his interest in her, utter sceptic though he was.

This is the season of guide-books, and the three which have come first to hand are among the best of their kind. Mr. Loomis's 'Index Guide' (Chas. Scribner's Sons), which might explain itself better if it were called a Dictionary Guide, has been enlarged by a few pages to take in a new route, viz., to Spain and the South of France. Other differences between the first and the present edition can doubtless be found by seeking, and we have noticed timely changes in minor details; but the scheme of this book was well and carefully wrought out in the beginning, and calls for very gradual and infrequent improvements. Its maps, plans, and cuts and handiness of reference are its striking features. Houghton, Mifflin & Co.'s 'Satchel Guide to Europe,' now in its twelfth edition, also needs no fresh praise. For the first time a folded map is given, and there are a few additions to the appendix. The old addenda to the index ought, we think, to have been incorporated with the main alphabet, instead of being repeated by themselves from last year. Osgood's 'Pocket-Guide to Europe' contains probably quite as much matter as that last named—more pages (nearly 500), in smaller type, making up for the difference in size. A whole tour in the North, embracing Norway, Sweden, and Russia, has been added, as the result of the editor's recent travel. New, also, are a list of U. S. diplomatic and consular agents in Europe, and a telegraphic code for travellers expressly prepared for the present edition.

With the foregoing may be mentioned, if not classed, C. L. Eastlake's 'Notes on the Principal Pictures in the Louvre Gallery at Paris, and in the Brera Gallery at Milan' (Houghton, Mifflin & Co.). The arrangement is first alphabetical by artists, and then numerical (by gallery numbers), where more pictures than one by the same painter are mentioned. The life dates of the artists and the room in which each painting is to be found complete the regular information. Mr. Eastlake's descriptions are more than literal, though to call them critical would be misleading. The cuts are singularly antiquated (the book is a reprint).

Prof. J. B. Greenough's text-book, containing the Eclogues of Virgil and the first six books of the 'Æneid' (Boston: Ginn, Heath & Co.), borrows a certain amount of matter from Allen and Greenough's 'Virgil,' but gives for the first time a special vocabulary covering the Latin poet's complete works — really a separate volume bound up with the text and notes. This vocabulary and the notes taken together certainly fulfil Professor Greenough's aim "to give or suggest a suitable English expression for every passage." Use in the schoolroom alone can determine whether this has been carried too far. The notes are very copious, and are illustrated with cuts, for the most part very helpfully. The typography has the customary excellence we expect from the imprint of this book.

The April number of *Appalachia* (Boston: W. B. Clarke & Carruth) exhibits well the various phases of the admirable organization of which it is the organ. Prof. Edward C. Pickering advocates experiments, with the aid of the Appalachian Club, to solve the problem of the superiority of mountain observatories to those of the lowlands, and describes the simple apparatus available for the purpose. Mr. A. E. Scott reports a rough climb with ladies over the Twin Mountain range in New Hampshire; Mr. J. W. Chickering tells of a trip to Roan Mountain, North Carolina, an easy matter and a cheap, when Washington is the base of the excursion; Mr. E. G. Chamberlain furnishes a chart of the Blue Hills near Boston, and enumerates the whole round of localities visible from the summit. Mr. W. O. Crosby, in a paper on the mountains of Eastern Cuba, concludes that the elevated coral reefs of that island confirm Mr. Darwin's theory of the formation of coral islands, against which these same reefs have been adduced by Mr. Alexander Agassiz. Finally, Mr. John Tatlock, jr., discusses the important subject of the variation of barometric measurements of altitude with the season. The usual reports of officers follow. The Club, now more than 500 strong, is prosperous, active, enthusiastic, and in a high degree public-spirited.

No. 24 of the *Pennsylvania Magazine of History and Biography* has been delayed by reason of the negotiations which have ended in the purchase of a new home for the Historical Society, the residence of the late General Robert Patterson. Mr. Townsend Ward's minute chronicle of "The Germantown Road and its Associations" now reaches its eighth part, and should, when completed, make a book of very great value and readability. It has from the first been very skilfully illustrated. What is still a nut for the Quakers, James Logan's communication to his fellow-sectaries in 1741 on defensive war, is printed apparently for the first time since the author had a few copies struck off for his own use. In printing some inedited documents relating to the settlement of the boundary dispute between Pennsylvania and Maryland, the editor apologizes for not following certain contractions in the MS., which were impracticable for his types. We agree, however, with Mr. C. F. Adams, jr., in a late communication to the Massachusetts Historical Society, that much of this facsimile printing had better be dispensed with altogether, or reserved for special occasions. There is, in fact, no more sense in reproducing the commoner abbreviations of our early ancestors than there would be in so treating those which are in vogue to-day in private correspondence, etc.

An interesting account of the progress of the Brazilian province of Rio Grande do Sul is given in an article by Mr. Herbert H. Smith in the May *Naturalist*. The German element now forms more than one-eighth of the population, and is the hope of the province. Since emigration from the mother country was checked some years ago, the increase in the labor supply has come chiefly from Italy. The confusion of tongues is thus already considerable.

The first of what we are disposed to believe will prove a valuable series of English texts of the sixteenth, seventeenth, and eighteenth centuries has just appeared in the play of "Gorboduc, or Ferrex and Porrex," edited by L. Toulmin Smith. The text is a reprint of the edition of 1570, preserving the original spelling and even punctuation; but it has been carefully collated with the editions of 1565 and 1590, and the variations noted at the bottom of the page. An ample introduction and a sufficient number of footnotes make this a very satisfactory edition of the first English tragedy for either the student or the general reader. This series is published by the German house of Henninger, at Heilbronn, but the annotations as well as the texts are in English.

The last number of the St. Petersburg *Vestnik Evropi* contains a spirited translation of Cable's story 'Belles Demoiselles Plantation.' The editor regrets that Bret Harte and Mark Twain, admirable as their humor may be, give but a one-sided impression of American literature, and presents Cable to his readers as a man of fore most rank—"a close student of the instinctive hostility between two worlds, the one feudal-European and the other New American democratic." The same magazine contains the first eight chapters of 'Marion Fay.' The translation is smooth and in the main faithful, though the irrepres-

sible Crocker is perforce much reduced in space. "A little tiff" or "taking a rise" could be as easily rendered in Ciceronian Latin as in Russian.

—Mr. W. M. Griswold writes us from Washington:

"Will you allow me to say that I may not claim the honor of writing various articles signed 'Arthur Penn'? I trouble you only because I find myself credited with them in a work likely to be largely read—viz., Mr. W. E. Foster's 'Libraries and Readers.'"

—The May number of *Harper's Magazine* is the first issue of that popular monthly, so far as we can recall, without an instalment of a serial story by an English novelist. Even after the American novelist had begun to come to the front, *Harper's* held fast to the established British favorites. The *Atlantic*, if we remember aright, has published but two English serials —Mr. Charles Reade's 'Griffith Gaunt' and Mr. Thomas Hardy's 'Two on a Tower.' The *Century* gave up imported fiction very early in its career. Of late, *Lippincott's* also has relied on the native novelist. Now *Harper's* follows suit. The transatlantic story, driven from the monthlies, still lingers in certain of the weeklies—in *Harper's Bazar* and *Weekly* and in the *Continent*—and even here it is elbowed and crowded by the native tale. It is a little curious that this discarding of English authors in American magazines is almost simultaneous with the invasion of England by these very monthlies. Perhaps the moral for American magazines in England is the same as that for American women in England, who succeed best when they are aggressively American, if we may credit Mr. James's 'Siege of London.'

—"San Francisco," by Mr. W. H. Bishop, and "The Brooklyn Bridge," by Mr. W. C. Conant, are the principal illustrated articles in *Harper's*. In the "Easy Chair" Mr. Curtis takes up the woman question—which, thanks to Dr. Dix, has received a new impulse—and endeavors to show that if fashionable women are vain, frivolous, and silly, it is because men keep them so; or, in other words, they refuse to recognize in women "the same liberty of choice in the conduct of life which men assert and maintain for themselves." But the peculiarity of the case is that in no time or country did women ever have as much liberty of choice as they have now. The force of masculine opinion to keep them in "subjection" or to make them "playthings" was never so weak. A woman's sphere to-day, as compared with what it was fifty years ago, is practically what she desires to make it; and it is by a perversion of this fact that Dr. Dix seems to make out his assumption that there is a connection between fashionable frivolity and the "higher education." The drollest part of the thing is, that the fashionable, silly woman is the last person in the world to bother her head about education. The enlargement of woman's sphere, which has been going on for fifty years, has had the effect of drawing off from the ranks of "society" a number of women who adopt careers of their own. Their desertion is one of the things that make society seem more silly and frivolous than ever; but the true thing for social reformers to do must be to stop this process toward general social vapidity by making women put their minds to as much use as they will stand.

—The *Century* for May has an entertaining and instructive article on Du Maurier and London society, by Mr. Henry James, who analyzes with great acuteness the change which has come over London, as exhibited in the pages of *Punch*, since Leech's day. The article is accompanied by some excellent illustrations reëngraved from Du Maurier's original drawings. It opens with some reminiscences of boyish interest in *Punch* on the part of Mr. James himself, which are the more interesting since thirty years ago the American boys who knew enough about England and English life to be much impressed by the adventures of Mr. Briggs, or by the humor of London domestic life, were few and far between. We believe it could be shown out of the mouth of the American press that one distinctly American view of *Punch*, and a widespread view, is, that it is not really funny at all. We have over and over again seen complaints of its dulness made by our own comic journalists, loud and sincere enough to help a good deal to make us understand why it is that we have no American *Punch*. Even Maudle, Postlethwaite, the Cimabue Browns, and the æsthetic world were made really intelligible here, not so much by *Punch* as by Mr. Oscar Wilde's appearance among us in person and Messrs. Gilbert and Sullivan's operatic satire upon the new school. Sir Georgius Midas and Mrs. Ponsonby de Tompkyns are hardly known in this country at all, except in a restricted portion of society which has relations more or less close with London. One of the facts of interest brought out by Mr. James is that the present reading generation in England cares very little for the superficial humor that gets enjoyment out of physical misadventures, practical jokes, and farcical contrasts, and insists on going much deeper for its humor. Du Maurier's satire, delicate as it is—sometimes so delicate that it hardly amounts to more than refined observation—often goes to the lower deeps of social folly and pretension, which Leech never attempted to reach, and could not if he had tried. Certainly the educated humor of our day is not the humor of high spirits that we remember in the *Punch* of Leech, or in Hood, or in Dickens, or in the old-fashioned farce, now driven off the stage. Loud laughter, perhaps, in a country as in an individual, betrays, if not a vacant, at least an uncivilized, condition of mind. At any rate, there can be small doubt that while Du Maurier may have created his market to a certain extent, he also found society prepared for him, and ready to welcome him, not with the broad grin it put on for Leech, but with a quiet, well-bred smile. Mr. Cushing continues his adventures in Zuñi-land, and tells some strange stories of the doings of the priests.

—Mr. J. Brander Matthews, whose knowledge of the stage—English, French, and American—is very full, has an article in *Lippincott's* on "Charles Lamb's Dramatic Attempts," in which a curious American sequel to the failure in England of Lamb's farce, "Mr. H.," is mentioned. Though few people ever read "Mr. H.," everybody has heard of it as the play which its own author helped to hiss off the stage. It appears, however, that this same thoroughly damned "Mr. H." was produced in this country, both in this city and in Philadelphia; and in the latter place, for ten years or more, it was one of the stock-pieces acted at the Chestnut Street Theatre. When it was first brought out, it met with "extraordinary success." Not only this, but Elliston wanted to act it again in England. Mr. Matthews makes the following remarks on the play, which suggest a view of the laws of dramatic composition, and the nature of the interest to which the humorous drama appeals, often overlooked:

"Before the play was done, Lamb wrote to Manning (then in China) that 'the whole depends on the manner in which the name is brought out.' Here was the mistake. It did not depend on the way the name was brought out. If the audience that night had been slyly let into the secret in an early scene, they would have had double enjoyment in watching the futile endeavors of the *dramatis personæ* to divine it, and they would not have been disappointed when *Mr. Hogsflesh* let slip his full patronymic. Kept in ignorance, the spectators joined the actors in speculation; and when the word was revealed, they were not amused by the disgust of the actors, so annoyed were they that they had been puzzled by a vulgar name. Perhaps, too, there was a certain reaction after the undue expectancy raised by the prologue. Lamb wrote to Wordsworth that the number of friends they 'had in the house . . . was astonishing.' Now, nothing is so dangerous on the first night of a new play as a large number of friends in the audience. . . . If it had had a second chance, the injudicious friends would have been absent, and the name of the hero would have been noised abroad, and, once in the possession of this secret, the audience might well have laughed long and heartily at the hero's misadventures."

"Great Minds and Matrimony," by L. D. Morgan, is a collection of facts connected with the matrimonial careers of noted people, which altogether present a very grotesque picture of the institution.

—The May *Atlantic* contains an article by Mr. Henry Cabot Lodge on what he considers the survival of the old colonial spirit in the America of to-day. This at least is the most important and novel part of the essay, the rest of it—which traces the early manifestations of the colonial spirit of dependence on England in politics, literature, society, and art—being introduced mainly as a groundwork for the suggestion that the Anglomania of our time is merely a new development and evidence of the colonial spirit, or want of true American independence.

"These groups," he says, "are for the most part made up of young men who despise everything American and admire everything English. They talk and dress and walk and ride in certain ways, because the English do these things in those ways. They hold their own country in contempt, and lament the hard fate of their birth. They try to think that they form an aristocracy, and become at once ludicrous and despicable. The virtues which have made the upper classes in England what they are, and which take them into public affairs, into literature and politics, are forgotten. Anglo-Americans imitate the vices or the follies of their models, and stop there. If all this were merely a passing fashion, an attack of Anglomania or of Gallomania, of which there have been instances enough everywhere, it would be of no consequence. But it is a recurrence of the old and deep-seated malady of colonialism. It is a lineal descendant of the old colonial family. The features are somewhat dim now and the vitality is low, but there is no mistaking the hereditary qualities. The people who thus despise their own land and ape English manners flatter themselves with being cosmopolitans, when in truth they are genuine colonists, petty and provincial to the last degree."

He also connects with this the fact that "some of our cleverest and best fiction"—*i. e.*, Mr. James's international studies and novels—is largely devoted to showing "how foreigners regard us," and consequently, though intended to be cosmopolitan, are "steeped in colonialism." Mr. Lodge, it should be said, uses the word "colonial" where most people would say "provincial"; but this is a small matter. We must confess that we are unable to discover anything either colonial or provincial in the cosmopolite school of writing which Mr. James has invented. He has introduced English and French types as well as American in his stories, and in one of his most amusing sketches, 'The Europeans,' he exhibits Europeanized Americans against a New England background, and surely there is nothing colonial in this. The discovery that there are such things as American types, and the use of them in fiction, seems to be really a very American and proper thing. Nor can we agree with Mr. Lodge that there is any distinctly traceable connection between the spirit which led Cooper to lay the scene of his first novel in England and represent it as writ-

ten by an Englishman, and the spirit which directs the proceedings of the Anglomaniacs of our day. Anglomania is a foreign fashion adopted in a capital which is not yet great enough to set fashions of its own, and which must get its fashions somewhere. There has been, however, a great deal of Anglomania in France (where the word comes from, in fact), and France certainly does not occupy a colonial relation to England. The survival of the true old colonial spirit may be most distinctly traced, it seems to us, in the extraordinary interest we still take and express in the opinions about us pronounced by any foreigner who runs over here on a vacation. The moment he lands we are all agog to know what he thinks of us, or at any rate the press thinks we are, for it stimulates the inquiry into his generally valueless opinions in every way in its power, and the whole thing always ends ridiculously by our finding out that he thinks very much what the last foreigner did. In no other great country in the world is this curious sort of vanity displayed. The English are profoundly and proverbially callous to all such criticism, and undoubtedly a similar indifference here will be one of the surest signs of the permanent disappearance of the colonial—or, as we should prefer to say, provincial—spirit.

—It is not a little surprising that with all the improved appliances that have for years past been in use by surveyors and travellers, and the improved methods which have been adopted for fitting these appliances to the purposes of geographical exploration, so much uncertainty should still prevail relative to one of the most salient of a country's features—its orography. Over but a comparatively insignificant portion of the earth's surface has there ever been effected what might be considered to be a complete mountain survey, or anything approaching one—a lack deplorably illustrated by the numerous discrepancies that are presented in the drawing of mountain contours, even as exhibited on what are generally supposed to be the most accurate of maps. Nor does there appear to exist any greater harmony concerning the heights of the more prominent elevations; indeed, so greatly do these vary, and so often have the figures adopted at one time been exchanged for different ones at another, that it frequently becomes a matter of great difficulty, if not, in fact, impossibility, to ascertain even approximately what is currently recognized as being the loftiest elevation of a given land area. This is notably the case with the continents of North and South America. Sorata, Illimani, and Aconcagua are still severally claimed to represent the greatest elevation on the South American continent, and consequently of the western hemisphere, although the divergence between the "authentic" figures indicating this elevation amounts to fully 3,000 feet. Nor are we much better off as regards the continent of North America, or, for that matter, the United States. It is only a few years ago that the altitude of Mount Hood, in Oregon, was reduced from 17,000 feet to a little over 11,000, bringing down what was then supposed to be the loftiest peak in our domain to the dimensions of a third-class elevation. Mount Shasta, in California (14,442 feet), was gradually superseded by Mount Whitney (14,887), but this last still yielded supremacy to Mount St. Elias, in Alaska, whose estimated height, according to American geographers, was placed at from 16,000 to nearly 18,000 feet, although credited (and still so credited) on the British Admiralty charts with only 14,800 feet. According to the more recent measurements of the national survey, this peak has been elevated to 19,500 feet, thereby considerably overtopping (as hitherto received) the peaks of Orizaba and Popocatépetl (17,800 feet), on the Mexican plateau, its only rivals on the North American continent. We now learn through Mr. T. U. Brocklehurst ('Mexico To-day'), who appears to have ascended the peak, that the generally accepted altitude for Popocatépetl is erroneous, the rim of the crater itself, which is still depressed 1,000 feet beneath the summit, being elevated about 19,000 feet above the level of the sea! To Mexico, therefore—at least for the present—belongs the honor of having the loftiest elevation on the continent.

—The married life of no German writer has been so persistently and malignantly scrutinized as that of Heine. For forty years his relations to Mathilde Mirat have been a constant source of gossip, and he has never been forgiven for having found happiness in the union with one so much his inferior in intellect. Yet even Goethe found in Christiane Vulpius all he looked for in a wife—"health, freshness, youth, devotion, and common sense, no matter what her station in society," as his biographer, Herman Grimm says; and Heine's "sweet, fat child" possessed in addition a uniform gayety of spirits which shed its radiance over the agony of his "mattress tomb." Her very inability to understand and appreciate his genius afforded him genuine amusement, while it lent a touch of pathos to his affection. He considered and loved her to the last as his "child"; he trembled for the "poor lamb" he should no longer be able to protect; and she repaid his love as she best knew how, with much unconcern for his literary greatness and not a little pious dread of his heathen sentiments, but certainly with all the affection of her guileless heart, which adored only two objects—Henri and "Cocotte," her parrot. Now that she has joined him on the Montmartre, the question so often asked in German periodicals, Has Heine left any memoirs, and if so, in whose hands are they? is discussed with renewed interest. Herr Gustav Karpeles, who contributes to the Berlin *Gegenwart* of March 31 a pleasant essay on "Mathilde Heine," and who is in a position to speak with authority, states that Baron Gustav Heine, the proprietor of the Vienna *Fremdenblatt*, is undoubtedly the possessor of his brother's memoirs, which, Herr Karpeles thinks, were the work of at least twenty years. The small manuscript in Mathilde's possession, entitled "Meine Memoiren," the genuineness of which Heine's niece, Frau Marie Embden, denied, is likewise unquestionably authentic, although, in the opinion of Herr Karpeles, of no literary value, inasmuch as it contains at best rough drafts of single chapters of the memoirs, together with matter that has already found its way into print. In a foot-note Herr Karpeles corrects several erroneous statements concerning Heine's connection with Karl Marx, which, since the latter's death, have gone the rounds of the press. Heine was not concerned in the publication of the bi-lingual *Annales Franco-Allemandes* edited by Marx and Arnold Ruge, although he contributed two or three articles to it; neither did he edit the *Vorwärts*, conjointly with Marx. Altogether, Heine was only for six months editorially interested in a periodical, the *Politische Annalen*, which he and Dr. Lindner published at Munich. But if Heine never was at the head of a large paper, like most literary men he often wished to be. It may not be generally known that he once seriously thought of establishing in Paris a German political daily. In a long letter to August Lewald, of March 1, 1838, he speaks with enthusiasm of his project. "As regards the value of the new journal, I flatter myself to have hit upon a combination which will surpass all existing papers, and may prove a grand success. For ten years I have studied the organism of the press in all countries, and I may say that no one knows its secrets better than I." His self-confidence becomes very amusing when he dwells on his business qualifications, his intimate acquaintance with the advertising department of the daily papers. In subsequent letters to Lewald he recurs to the subject, although in a less confident tone, in spite of the unexpected permission of the Prussian and Austrian authorities to circulate the journal in those countries. Sanguine as he seemed of success, he trembled at the mere possibility of failure. He had an honorable dread of risking the money of strangers in his enterprise, and his great project came to nothing.

—In the *Nation* of January 30, 1879 (No. 709), we noticed briefly the first volume of Prof. A. De Gubernatis's 'La Mythologie des Plantes,' devoted to general botany, and containing an account of the myths, etc., relating to classes of plants. This interesting work is now completed by a second volume (Paris: Reinwald, 1882) devoted to special botany, and giving the legends of individual plants. Although this does not possess the general interest of the first, it is full of curious learning. The author has ransacked the older treatises on herbs, and added much information of his own in the shape of popular legends and superstitions not before printed. Some of the articles assume the proportions of essays, as, for example, those on the oak, wheat, walnut, etc. The last tells of the famous walnut-tree of Benevento around which was held the Sabbath of the Witches (*ludos nucis Beneventanæ*). In the article on the *quercus ilex* the author mentions a Russian superstition in accordance with which sick children were carried into the woods and thrice passed through the trunk of an oak split open. The child was afterward carried around the tree thrice nine times (the number of the days in the lunar month), and his shirt hung upon the branches of the oak. It is interesting to find this superstition in the South of France during the Middle Ages. Étienne de Bourbon, an Inquisitor of the thirteenth century, tells us in his 'Tractatus de diversis materiis prædicabilibus' (extracts from which were published by the Société de l'Histoire de France in 1877) that sick children in the diocese of Lyons were similarly treated. The child was afterward left naked at the foot of the tree, while two candles as long as one's thumb burnt out. If the child survived this heroic treatment, he was dipped nine times in the Chalaronne. Étienne pithily remarks: "Qui valde dura viscera habebat si evadebat nec tunc vel cito post moreretur." Whether one agrees or not with Professor De Gubernatis, who naturally sees a solar myth in every legend, one cannot but thank him for a work which worthily takes its place by the side of the same author's 'Zoölogical Mythology.'

—The two-volume 'Handbuch der Politischen Oekonomie,' edited by Professor Gustav Schönberg, of the University of Tübingen (New York: B. Westermann & Co.) is not a succinct manual of political economy in the ordinary sense, but a collection of elaborate treatises on the various branches of the science by twenty-three authors, mostly university professors, among them some of the best-known writers on these subjects in Germany. Its avowed object is to represent "the present state of the science." The treatises it contains cover the following subjects: A definition of the science of political economy and its development down to our day, by G. Schönberg; the history of political economy, by H. von Scheel; Socialism and Communism, their development and present status, by the same author; Fundamental Principles of Political

Economy, with definitions of its various subject matters, by Fr. I. Neumann; Economic Production in General, by Fr. Kleinwächter; Prices, by Fr. I. Neumann; Money and Coinage, by E. Nasse; Credit and Banking, by A. Wagner; Transportation and Communication, by E. Sax; Weights and Measures, by L. Jolly; Economic Distribution, Rents, etc., by Th. Mithoff; Economic Consumption, by W. Lexis; Agriculture—its objects, historical development, requirements of production, organization of production and returns, by Baron von der Goltz; Agrarian Policy in the Modern State, by A. Meitzen; Forestry, by Joh. A. R. Helferich; Fishery, by B. Benecke; Mining, by R. Klostermann; Trades—their definition, organization, and development, by G. Schönberg; the same, with reference to the labor question, by L. Brentano; the same, with reference to legal protection, patents, trademarks, etc., by R. Klostermann; Commerce, by W. Lexis; Insurance, by A. Wagner; Personal Service, by G. Schönberg and L. Jolly; Population, by G. Rümelin. Then follows, in the second volume, The Science of Finance, with the following subdivisions: The Definition, Objects, and History of Financial Science, by F. H. Geffken; State Expenditures, by the same author; State Revenues, from Real Estate, from Mining, Industrial, and Commercial Enterprises, and from Means of Transportation, by H. von Scheel; Fees and Special Taxes, by K. Fr. Schall; The Science of Taxation, by Joh. A. R. Helferich; Direct Taxes, by A. Wagner; Indirect Taxes, by K. Fr. Schall; Tariff Duties, by K. V. Riecke; Financial Regulations and the Public Credit, by A. Wagner. Finally, the Science of Administration, subdivided as follows: Statistical Science, its History and Theory, by G. Rümelin; Governmental Organization of the Administrative Machinery in France, in England, in Germany, by G. Meyer; Sanitary Regulation and Police, by L. Jolly; Game Laws, by L. Jolly; Poor Laws and Police Regulations, by E. Löning; Police Regulation as to Private and Social Morals. This 'Handbook' is the most comprehensive work on its subject ever presented to the public. It contains an immense variety of information, digested with philosophical thoroughness. But its comprehensiveness and its size—it fills over 1,900 large octavo pages—unfit it for the ordinary use of a manual. It is rather an encyclopædia, and as such will be of very great value to the student.

—The programme of the fourth and last concert of the Oratorio Society was remarkably old-fashioned. This statement may seem paradoxical in view of the fact that it comprised, besides Haydn's "Creation," two compositions by Herr Max Bruch, who personally conducted them. But Max Bruch is almost as old-fashioned as Haydn, with this tremendous difference, that whereas Haydn in his day was epoch-making, Bruch is anything but that. In fact, Bruch's compositions very seldom even betray the influence of the modern movement in music. He is a clever Kapellmeister, who thoroughly understands the art of writing for a chorus in combination with the orchestra, but who seldom has an original idea on which to expend his skilful workmanship. The two principal directions in which music has advanced since the days of Haydn are in the development of the resources of the orchestra, and in the multiplication of the means of expressing definite emotions by means of new modulations and the suspended resolution of discords. In both of these features Bruch's compositions are deficient. He often chooses pictorial subjects for his cantatas, but his music is neither descriptive nor even characteristic; it is simply absolute music in disguise. His instrumentation is monotonously gray, often turbid or opaque, although always correct. His shrewdness in composing chiefly works in which the modern repertory is somewhat deficient—violin concertos and short, easy cantatas—has given his name greater prominence than it deserves, in comparison with several more gifted but less fortunate composers in Germany and elsewhere. Nevertheless, Herr Bruch is an able musician, and as he is understood to be a good organizer of musical societies, he must be heartily welcomed in this country, if he does not insist on giving us too much of his own work to hear. Obviously he has experience and natural aptitude as a conductor. He seldom uses his left arm to suggest a crescendo, accelerando, or other dynamic or rhythmic change, but indicates his meaning by a glance, or a greater sweep of the bâton. He has very sensibly adopted the custom of turning his back on the audience instead of facing it, as is generally done in Germany. But to return to the Oratorio Society: the performance of the prelude from Bruch's "Loreley," and of the "Jubilate Amen" by the chorus and orchestra of the society, as well as that of the "Creation," was generally good, and in some numbers really excellent. The soprano solos were intrusted to Miss Emma Juch, who is specially qualified as an oratorio singer by reason of the great volume and sonority of her well-trained voice. Herr Max Heinrich rendered the bass solos and recitatives in a very impressive manner, and Mr. Woodruff proved a satisfactory tenor. The audience was large, and the performance seemed to give them considerable pleasure. It is to be hoped that the Society will next year produce Bach's "Passion Music," which was announced for this season, but had to be withdrawn for unavoidable reasons. There is more good music in that work than in a hundred programmes like that offered on the 19th instant.

LESLIE STEPHEN'S SCIENCE OF ETHICS.

The Science of Ethics. By Leslie Stephen. London: Smith, Elder & Co.; New York: G. P. Putnam's Sons.

Mr. Leslie Stephen's "attempt to lay down an ethical doctrine in harmony with the doctrine of evolution" has a charm rarely found in essays on morals. The charm of the book, moreover, is also the secret of its power. This attractive quality, which gives a flavor to every line in the 'Science of Ethics,' is a sense of reality. Mr. Stephen is a rigorous thinker: no one can accuse him of indifference to the coherence of his argument; no sentiment ever tempts him to deny the legitimate results of his premises. But for all this he is—and this is, in our judgment, his great merit—primarily an observer, and, so to speak, only secondarily a dialectician. Hence he has an eye for facts, a habit of referring to the actual experience of daily life, a distrust in verbal formulas; a sense, in short, of reality, often wanting to men of great argumentative power. He is in feeling rather a man of science than a logician. We can well understand his fervent admiration for Darwin, and can well believe that Mr. Darwin would in turn have appreciated the merits of an ethical treatise written in what may be called, in the best sense of the words, a "Darwinian" spirit.

It is curious, from a merely literary point of view, to note how much grace and interest is given to Mr. Stephen's style by his habit of dealing with real things rather than with words. Nothing shows this better than a contrast which lies near to hand. Prof. Bain, in an interesting article, which is in reality a review of the 'Science of Ethics,' writes as follows:

"A Hedonistic introduction would force on the discrimination between ethical and non-ethical Hedonism, and might thus save the main subject from the evils of confusing the two. The preliminary sociology would probably confirm the distinction in a way of its own while serving many other purposes. Indeed, the sociology would be necessary to complete the Hedonistic survey, although not necessary for the commencement of it."

With the sentiments expressed, or meant to be expressed, in this passage we have no concern. We do not doubt that the Professor intends to convey to his readers some profound and important meaning. We may even go further, and admit that the language used probably does convey to those acquainted with Mr. Bain's style ideas of importance. What we are concerned to point out is that such modes of expression as those used by Prof. Bain, or anything like them, could not by any possibility occur in Mr. Stephen's treatise. This is much more than a mere criticism on style; it is much more than saying that Prof. Bain writes nearly the worst, and Mr. Leslie Stephen nearly the best, style of any of the living authors of eminence who discuss moral problems. The difference lies very deep. The Professor is looking at ethics logically, and as a dialectician, and hence uses to excess technical terms and formulas. Mr. Stephen has his eye constantly fixed on real life—we may perhaps conjecture, on personal experience. He, therefore, writes about morality in the clear, untechnical language in which he would write about the affairs or literature of the day. Thus, we hear nothing from him as to the necessity for a "Hedonistic survey," but we have constant references to homely facts as a solid basis for weighty inferences. Thus, the "theorem," that "most mothers love their children," whether it be as important and astonishing a phenomenon as Mr. Stephen apparently holds it, is a principle which we can all understand, and which rests upon constant experience. When we read: "I act as confidently upon the assumption that mothers love their children as upon the assumption that London Bridge will bear the weight of the passing crowds," we know that we are in the hands of a teacher who, whatever may be the defects of his theory, expresses himself in the plain language of ordinary life, and who deals with things, not with formulas. The truth is, that in style Mr. Stephen has many of the merits of an author with whom he has little otherwise in common. There are a hundred points of contrast between the 'Science of Ethics' and the 'Principles of Moral and Political Philosophy,' by William Paley, D.D.; but as regards simplicity and what one may term reality of style, Mr. Stephen may well compare with the writer who influenced the opinions of our fathers far more deeply than any single moralist influences the English or American opinion of to-day.

The quality which gives the literary charm to Mr. Stephen's work is also, as we have intimated, the source of its power. This is exactly one of the cases in which it is impossible to keep apart style and thought—the mode of expression and the worth of the thing expressed. Mr. Stephen talks the language not of the lecture-room or the study, but of ordinary life, and hence his work charms readers who could scarcely force themselves through the pages of Prof. Bain or of Herbert Spencer. But he uses the language of ordinary life because he is writing about the habits, the convictions, the morality of living men and women. The result is that, though many of his views are open to criticism and dissent, he entirely avoids the error of overlooking the obvious features of human nature. In this respect Mr. Stephen compares favorably with a writer to whom he admits his great obligations, and of whom no one ought to speak without the deepest respect. Whoever has studied Mr. Henry

Sidgwick's 'Methods of Ethics' will, as he reads the 'Science of Ethics,' be constantly struck with the points both of similarity and of difference between the modes in which two authors of equal honesty and talent treat the same topic. As regards logical acuteness, clearness of style, copiousness and variety of argument, Mr. Sidgwick can hardly be rivalled—he certainly cannot be surpassed. Look at ethical problems from his point of view, and you may almost say that the subject is exhausted. If, however, you begin to consider what is the right point of view from which to look at ethics, you may well doubt whether Mr. Stephen's sense of reality is not more likely to put one on the right path than Mr. Sidgwick's astounding dialectical subtlety. The 'Methods of Ethics' rests on the doctrine that man is a rational being, and that the one desideratum of a sound ethical theory is that it should be rational. Mr. Sidgwick's love of reasoning leads him into the error of thinking that men care far more than in fact they do that their conduct should be "reasonable." Mr. Stephen, whose views are based quite as much on observation of men and women as on any theoretical dogmas, never has absent from his mind the extent to which feeling rather than reason of any kind is the power which rules men's actions. Nothing, in fact, in his whole work is more impressive than the mode in which he even demonstrates the absolute and inseparable connection between reason and feeling:

"No theory can be tenable which virtually asserts reason and feeling to be two separate and independent faculties, one of which can properly be said to govern the other. The reason is not something superinduced upon the emotions, as something entirely new. There is no absolute gap between the lower and the higher organisms. The animal instinct may be regarded as implicit reason, or the reason as highly developed instinct. . . . The increased range of thought due to the power of forming abstract conceptions and reasoning by symbols is associated with an equal growth in the complexity and variety of the corresponding emotions. That we may have a nature capable of being stirred by such words as patriotism, philosophy, and religion, we must have an intellect capable of operations utterly beyond the reach of the lower being, but we must also have sensibility capable of a vast variety of equally new sensibilities."

This passage—or rather the whole chapter on "The Reason as Determining Conduct," from which these fragments are taken—contains important truths which lie very near the basis of all Mr. Stephen's doctrine. They also afford a most admirable specimen of that sense of reality which directs the course of his speculations.

For it is clear that Mr. Stephen's governing idea is to base morality upon a knowledge of human nature as it is known to us from experience and from history. The fact on which his conclusions are rested is the doctrine, at least as old as Aristotle, that man is a "political" (or, as we should say in modern times, a "social") being, and that you therefore make a false start if you attempt to analyze human nature without reference to the connection between men and the society in which all men live and by which they are influenced. "A man not dependent upon a race, is as meaningless a phrase as an apple that does not grow upon a tree. The words have no sense, or a purely arbitrary sense." Look upon man as essentially the member or the part of a society, and you must "consider the race as forming what is called a social organism, or, as I have preferred to say, as forming social tissue." This "tissue is built up of men as the tissue of physiology is said to be built up of cells. Every society is composed of such tissue, and the social tissue can no more exist apart from such associations than the physiological tissue exist apart from the organs of living animals." The "associations" referred to are the political, ecclesiastical, industrial, and other organs of social life. Now, in every society, if we understand Mr. Stephen rightly, you must distinguish properties implied in the particular organization of the society—*e. g.*, the arrangements of the English Constitution—and fundamental properties, in virtue of which the society may be said to belong to a certain kind of social tissue. Now, the moral law, following out our author's view, is, under one aspect at least, a statement of the

"conditions essential to the vitality of the social tissue. It may be more than this in various ways; but it must be this, whatever else it is. The process by which society has been developed implies that the most important characteristics developed in the individual by the social pressure correspond to the conditions of existence of the society. The moral law defines some of the most important characteristics so developed, and is therefore a statement of part of the qualities in virtue of which the society is possible. It is not an exhaustive statement, for other qualities may be essential; nor an absolutely accurate statement, for societies exist in which morality varies within wide limits. But, so far as it goes, it must be an approximate statement of part of the conditions."

This definition or statement of the moral law is meant to give the "cause," not the "reason," of our moral sentiments.

"Our moral judgment must condemn instincts and modes of conduct which are pernicious to the social vitality, and must approve the opposite; but it does not necessarily follow that it must condemn or approve them because they are perceived to be pernicious or beneficial. . . . Here I will only observe that there is no absurdity in supposing that the cause of our likes and dislikes may in some sense be the fact that they are useful to us, though we may not be conscious of their utility."

We have purposely kept to Mr. Stephen's phraseology. The term "tissue" is perhaps the only technical term, if we may so call it, used throughout his treatise, and we frankly confess to regretting his constant employment of a metaphorical expression where his meaning would certainly gain in clearness if he varied the metaphor under which it is expressed. Still, his general meaning is not obscure. The moral law is the mass of fundamental rules—*e. g.*, that men ought to be courageous, that temperance is a virtue, that we must practise justice, and the like—which have been gradually developed in all societies which have continued to exist, because such fundamental rules have been found to be conditions of existence.

"Society, I have said, may be considered as an organism, implying what I have called social tissue modified in various ways so as to form the organs adapted to various specific purposes. The existence of the social tissue at any stage of development, and its power of maintaining itself either as a part of the special order or as against other societies, depends essentially upon the fulfilment of certain conditions. . . . Morality is a statement of the conditions of social welfare; morality, as distinguished from prudence, refers to those conditions which imply a direct action upon the social union."

Hence, as Mr. Stephen points out, we can explain and justify the various qualities generally attributed to the moral law. It is natural, because it affects all men in so far as they have reached a certain stage of development, and because it cannot be affected by the mere will of the legislature or the sovereign. It can be varied only through great periods of time, and hence may well be called immutable or eternal. It tends to be transformed from the external rule, Do this, into the internal principle, Be this. It is, therefore, in a true sense, internal. To this may be added that the view of morality as being the expression of the conditions of social health or existence explains at once the essential permanence and universality, and also the exceptional mutability and variation, of moral principles. You can see, in short, on the theory of evolution, both why moral rules are not conventional, and why at the same time they are not, in the strict sense, immutable. Of the singular skill with which Mr. Stephen has worked out the theory of evolution as applied to morals, no fair idea can be derived from any mere abstract of his views. The book itself must be read by any one who wishes to understand the strength of the case in favor of Mr. Leslie Stephen's general theory, and any candid reader who takes the pains to study the 'Science of Ethics' will, even though he may not admit all Mr. Stephen's conclusions, probably concede that in the domain of morality, as in other spheres of speculation, the doctrine of evolution affords a real explanation of many perplexing phenomena. The question which still remains to be answered is, whether a theory which explains many things can fairly claim to explain everything.

Mr. Stephen's general theory of morals is, as our readers may see from the very inadequate outline we have given of it, both important and suggestive; we hope on some future day to recur to some of the controversies which it raises. But it is no disparagement to a very ingenious writer to say that his isolated observations are often of more weight and better samples of his powers than his whole theory. The same thing holds good of almost every eminent moralist. No human being nowadays, in reality, follows the ethical or the political systems of Plato or of Aristotle. But the 'Republic' and the 'Nicomachean Ethics' contain observations on character or life which will never grow old. Few persons now adopt the philosophy of Paley, but such remarks as the following—"in discoursing to young minds upon topics of morality, it requires much more pains to make them see the difficulty than to understand the solution"; or that "a system of morality built upon instincts will only find out reasons and excuses for opinions and practices already established: will seldom correct or reform either"—still give ground for useful thought to persons who entirely reject their author's form of utilitarianism. The 'Science of Ethics' positively abounds in reflections which have a worth quite independently of the theories in which they are embodied.

"It is more accurate to say that my conduct is determined by *the pleasantest judgment than that it is determined by my judgment what is pleasantest*. . . . A man, for example, acts in a given way under the influence of vanity. Although he knows he will be happier in the long run if he abandon some burdensome honor, his self-esteem nails him to the post. He is governed by the instantaneous feeling, by the immediate sense that his resignation would expose him to ridicule or contempt; and though this generally includes a foretaste of future suffering, he is determined by the actual painfulness of the choice, not by the belief that he is choosing something which will produce pain."

Can any one accustomed to reflect at all on moral puzzles doubt that the words we have underlined contain in the very neatest form a subtle distinction which solves many difficulties, and that a happy illustration, the fruit of acute observation, makes a rather fine point perfectly clear? Take, again, as a sample of fruitful suggestion, this exposure of a current fallacy which underlies half the movements of the day:

"That the proposition, 'This habit is a bad one,' may have any real meaning, we must assume that the organism can exist without the habit. . . . We must compare the whole man as he exists with a certain quality, to the whole man as he exists without it. To suppose that any given characteristic can be simply subtracted, is to *argue as though cutting off a leg had no other consequence than removing a*

crutch. . . . We are always tempted to assume that we can take off a habit as we can take off a coat, and to suppose that some social evil can be remedied by simply removing the most obvious source of the mischief, without troubling ourselves to ask what other organic changes will be set up. This error . . . is . . . almost the master error of crude sociology, and it may be described as a virtual confusion between organic and merely mechanical wholes."

If our author here exposes the errors of uneducated enthusiasm, he cuts at least equally deep at the fundamental mistake of jurisprudential ethics. "Lawyers are apt to speak as though the legislature were omnipotent, as they do not require to go beyond its decisions. It is of course omnipotent in the sense that it can make whatever laws it pleases, inasmuch as a law means any rule which has been made by the legislature; but from a scientific point of view it is strictly limited." It is limited from within, because the legislature itself is the product of social conditions; it is limited from without, because the power of imposing laws is dependent upon the instinct of subordination, which is itself limited by social conditions. "If a legislature decided that all blue-eyed babies should be murdered, the preservation of blue-eyed babies would be illegal; but legislators must go mad before they could pass such a law, and subjects would be idiotic before they could submit to it." Here we have a refutation of half the fallacies of the Austinian pedants, who try to apply their master's analysis of the nature of law to spheres certainly not within his contemplation when he defined the province of jurisprudence.

The matter is the better worth notice because Mr. Leslie Stephen, by using at one part of his book a common but very misleading metaphor, runs the risk of leaving on his readers' minds a totally false impression of the general drift of the work. "The law of nature," he writes, "has but one precept, Be strong; nature has but one punishment, decay culminating in death and extirpation, and takes cognizance of but one evil, the weakness which leads to decay." This isolated and ill-considered piece of rhetoric certainly suggests that Mr. Stephen is one of those who make a sort of deity of force and strength. No conception could be more erroneous. As you read his analysis of Sympathy and Altruism, you soon perceive that feeling, sympathy, affection in all its forms, and especially the family affections, are to our author the true source of social strength and health, and thus a treatise of which the nominal text is "Be strong," exhibits something which might almost be termed a mystical tendency to insist on the precept, "Love one another." In this, in short, as in every other part of the 'Science of Ethics,' we see that Mr. Leslie Stephen bases his theories not on any abstract dogma, but on a sense of what is real, and that nothing in human nature seems to him so real as the sympathy which links man to man, husband to wife, mother to child. Whatever be our doubts, such sympathy is a real fact, and Mr. Stephen seizes upon it with the firm grasp of a man full of a sense of reality.

WILLIAM CULLEN BRYANT.

A Biography of William Cullen Bryant, with Extracts from his Private Correspondence. By Parke Godwin. In two volumes.

The Poetical Works of William Cullen Bryant. Edited by Parke Godwin. In two volumes. D. Appleton & Co. 1883.

MR. GODWIN would have made his life of Mr. Bryant more interesting if he had made it shorter. How to make a biography without incident attractive to the reader is always a serious problem; but in Mr. Bryant's case the end can hardly be attained by the elaboration of details, or by resort to his correspondence, for the routine of his life is only made the more apparent by the first, while his letters are as a rule rather dry reading. There is in them little play of fancy, not often many touches of humor; such criticism of public men and events as they contain has mostly lost its interest. Mr. Bryant's career as a poet was but slightly connected with his life as a journalist, and one throws very little light upon the other. Though as a boy he attempted political satire in verse, not without success according to the taste of the times, the verses which brought him most reputation have an atmosphere as far removed from that of the newspaper or political world as if he had remained all his life among the quiet hills of western Massachusetts. He appears to have gone into journalism not because it attracted him as an occupation, or because he had ideas or beliefs which he wished to preach and spread, but because poetry did not furnish him a means of livelihood, and law, for which he seems to have been in some respects well qualified, did not attract him. Of the uncertainties and dangers of a literary career he always had a just estimate. Nobody was ever less of a Bohemian than Mr. Bryant. Indeed, we may say, if he had been a little more of one, if he had had a dash of recklessness, if he had made a mistake now and then, if he had not had all his passions and appetites and desires under such perfect control, Mr. Godwin would have found the task of interesting the reader in him far easier. Few poets in the history of literature have managed their lives with so much business sagacity and shrewdness as Mr. Bryant; and the consequence of this is that in Mr. Godwin's volumes we get a more vivid picture of this shrewd management and the success with which it met than of the poetical reverse of the career. For all practical purposes, indeed, Mr. Bryant's life was that of a man of business. His toil was constant and related chiefly to practical matters. He spent his life in building up a newspaper. Poetry was his relaxation.

His journalistic career was very different from any that is possible at the present time. It must of course be judged with reference to the condition not only of New York, but of the whole country in his day. It is not too much to say that in the early part of this century, and down, in fact, to the war, the tone of society and literature, of the press and politics in the United States, was that of a distinctly rural democracy. Our fathers lived, to a far greater extent than is now the case, in villages, or on farms, or in small towns. Instead of city life giving its tone to the country, as it does so much now, the healthy but somewhat dull rural atmosphere invaded the towns. It must be admitted that looking back at this period of our existence, we were dull. It was one of the results of this dulness that every event and incident and person assumed an unreasonable and unnatural importance. A local election, a controversy over some fresh "lie" of Cheetham or Duane, the arrival of a popular European author, or an unpopular actor, filled the whole community with excitement, passion, or delight—feelings which were heightened by a keen perception of the fact that these were events in the history of a new republic for which we were all responsible, and that "the eyes of Europe were upon us." City civilization necessarily produces a different tone from this—it may be a more cynical and selfish tone, but at any rate one which does not lend itself to the magnification of events and persons so readily.

Mr. Bryant enjoyed all the possible advantages of this early rural atmosphere. He wrote poetry, and in an instant he had the attention of the entire country. He took up a newspaper, and became the "great American editor." It is with no intention of belittling the value of Mr. Bryant's services in literature or politics that we mention this fact; it is rather in his interest that it should be recalled, for the habitual exaggeration of the period should not be allowed to drive us to the opposite extreme of indifference to such solid claims to attention as his career actually presents. It is the fashion to call the atmosphere which made this exaggeration possible "provincial" and "colonial," and so it was; but the rural "note" is as distinctly marked in these volumes. In the New York of Mr. Bryant's early days, we always feel the presence of "the neighbors," and notwithstanding the ferocity of politics, there was something almost village-like in the tone of life.

Mr. Godwin begins with a few pages of autobiography, written by Mr. Bryant in 1874-5, only three or four years before his death. This contains an account of his family and childhood, and a very good picture of the surroundings of his early days. His father was a Federalist. Mr. Bryant, taught as a boy to regard Jefferson and his party with a holy horror, came later to be a Democrat, and in the end a Republican. The reasons for the latter change are easily understood. Mr. Bryant's case was the common one of an anti-slavery Democrat forced slowly out of the party by its gradual retrogression on the slavery question. But the first change was a more interesting one. It seems to have taken place when Mr. Bryant was a man of twenty-eight or thirty years of age, and the causes which led to his conversion would probably present, if they were known, a picture of the growth of the feelings, ideas, beliefs, and hopes which gave the Democratic party so firm a hold upon the educated public opinion of the country in the second quarter of the century. We get, however, little or no light upon these.

Coming to New York, Mr. Bryant began his work as an editor, and continued it down to the time of his death in 1878, with interruptions caused by trips to Europe, Mexico, and the East. During all this period he occupied a prominent position in this city, of a kind which no journalist is ever likely to occupy again. The period of what we may call hortatory journalism has been succeeded all over the country by a more critical system. When Mr. Bryant began to write, the newspapers of New York were too often edited by low adventurers, who played the part of literary puffers and bravos in the politics of the day, extolling the virtues and magnifying the fame of the great men on one side, and spreading the necessary falsehoods and slanders about the great men on the other. Mr. Bryant was the first editor of any note to perceive that the party press might be used for better purposes than these; that an editor might use his newspaper as a pulpit for exhortation and argument. His introduction of this system was a great public benefit, and was immediately recognized as such. The Democratic wave which was then sweeping over the country made the undertaking easier in one way, for it enabled an editor to identify himself the more readily with "the people," and to attribute to "the people" ideas and arguments which were really his own and make them the groundwork for earnest appeals to the party. A vast amount of Mr. Bryant's editorial writing consisted of exhortation of this kind, and most of his writing has a hortatory color, which sounds rather strange and uncritical in our ears. In his day, however, it was the best of its kind, and its kind is by no means extinct—though it is now kept alive by the rural rather than the city press. It is always necessary in considering the

journalism of that time to remember that for a purely critical editorial career the atmosphere of a great capital is necessary, and not only that New York was, as we have said, a small town, but that the whole country enjoyed a sort of pre-urban civilization.

It was on his poetry, however, and not on his editorial career, that Mr. Bryant preferred to rest his claim to permanent fame; and in this he was clearly right. He was early recognized at home and abroad, through such poems as "Thanatopsis" and "The Waterfowl," as having something to say in verse which had an inspiration of its own. The praise and exultant admiration at once lavished upon him were undoubtedly exaggerated, but at the same time unaffected. A long line of American poets have succeeded him whose merits have been such as to alter our perspective seriously. We are less inclined to liken him, as his contemporaries did, to Wordsworth, than to inquire in what sort of a relation he stands to Longfellow, Lowell, Whittier, and Emerson. He must be regarded as distinctly an American poet, for there is in his verses an atmosphere, moral and material, which distinctively belongs to this country. The melancholy which pervades his poems is the melancholy of the vast American landscape, unpeopled yet, and impressive, but sadly impressive, to the imagination. It is not the poetry of rapid, active, passionate life. It is lonely poetry, in which we hear the moaning of the bleak winds among the desolate hill-tops of western Massachusetts, feel the silence and cold of the long winters, and the death in life which solitary nature is so apt to suggest. In a certain sense Mr. Bryant might be said to be the poet of loneliness, tempered by morality and religion. In "Thanatopsis" the charm is the charm of death—the soothing feeling produced in the weary mind that, after all, life must end and the ineffable peace of eternity be ours too. But the poem is given a moral, just as "The Waterfowl" is, and a moral of that somewhat elementary kind which has since Mr. Bryant's day characterized so much of American poetry. Mr. Bryant's fondness for moralizing on life and duty, in a manner which suggests the pulpit, or sometimes what is known in the newspaper world as the "sanctum," is the only connection that can be traced between his editorial and his poetical life. In this vein, however, Longfellow was destined to surpass him.

Mr. Godwin's volumes contain copious extracts from Mr. Bryant's correspondence, the most valuable part of which consists of the letters which passed between himself and his friend Mr. R. H. Dana, himself a poet, whose suggestions and criticisms were always listened to by Mr. Bryant with respect, and often adopted. His letters from abroad are generally of little permanent value, owing apparently to the lack of any genuine critical interest. He saw all the distinguished men of his time, and was on terms of friendly intercourse with many of them, but to our knowledge of them he contributes almost nothing. His acquaintance with European modes of life and thought was, indeed, very superficial, and there is in his letters curiously little of the citizen of the world.

DOYLE'S ENGLISH COLONIES IN AMERICA.

English Colonies in America: Virginia, Maryland, and the Carolinas. By J. A. Doyle, Fellow of All Souls' College, Oxford. Henry Holt & Co. 1882. 8vo, 420 pages.

MR. JOHN ANDREW DOYLE is a graduate of Balliol College, Oxford, where he won a "first class" in *litteris humanioribus* in 1867. He became a Fellow of All Souls', the endowments of which college are now specially applied to the fostering of studies in law and history. Mr. Doyle held for several years the Vinerian Readership of Civil and English Law, but he has specially devoted himself since graduation to the study of American history. In 1869 he won the Arnold Prize for an essay upon 'The American Colonies previous to the Declaration of Independence,' which was published that year in an octavo volume of 219 pages. This work was undoubtedly the basis of Mr. Doyle's 'History of the United States' (in "Freeman's Historical Course for Schools"), and is evidently the rudimental essay from which the present larger work upon the 'English Colonies in America' has evolved by a scholarly process of natural selection. The author himself says that he has in some measure incorporated into his new book the substance of his two smaller works.

Although written from an English point of view, all of Mr. Doyle's writings are characterized by a remarkably fair-minded, impartial spirit. His last work is superior in many ways to those which have preceded it, more especially, it might be said, in point of original research, amplitude of detail, philosophic grasp, and literary finish. He has not had access to the full range of colonial sources, or even of written history upon the colonial period, but from all the materials within his reach he has extracted the very quintessence of fact, and has given us valuable results in his own style—at once clear, compressed, and uniformly good. The reader of Mr. Doyle's work may wish, perhaps, that there were more picturesqueness of description, more life and color in his writing; but this can be attained only by a closer observation of American society in its historical development. Moreover, Mr. Doyle's standpoint is not that of a sociologist, but of a student of institutional history. For such an observer matters of government, laws, and constitutions have more interest than manners and customs.

Mr. Doyle proposes in three volumes to "describe and explain the process by which a few scattered colonies along the Atlantic seaboard grew into that vast Confederate Republic, the United States of America." The present, or first, volume is tolerably complete in itself, and treats of the history of Virginia, Maryland, and the Carolinas, down to the close of the seventeenth century. The next volume in the series will be devoted to the New England colonies, within the same chronological limit; and the last of the three will embrace the early history of the other English colonies in America, and continue with the entire group down to the time of its separation from the mother country. The close of the first period, as Mr. Doyle says, "marks a distinct break in the administrative system adopted toward the colonies and in their relations to the English Government." The groundwork for colonial independence and self-government was laid, during the seventeenth century, under the proprietary and chartered governments, and in certain provinces enjoying royal favor; but the eighteenth century marks the up-building of colonial unity under a strengthening and centralizing royal authority, manifested not alone in royal governors in various colonies, but more generally in economic administration and in the conduct of wars with the French and Indians. The Declaration of Independence, caused by an increasing economic pressure, resulted in the shifting of sovereignty from the English crown to the English people in America, who already in many ways had discovered their unity of interest, and who had long been locally organized in old English ways.

The chief excellence of Mr. Doyle's work lies in his clear and detailed exposition of the continuity of English institutions in the New World. He regards "the history of the United States as the transplantation of English ideas and institutions to a distant soil, and the adaptation of them to new wants and altered modes of life." He does not hold to his English theory in any servile, pedantic way, but endeavors to point out, in the very lines of English continuity, a certain developmental process in American institutions. He makes proper allowance for new conditions, changing circumstances, and varying needs in the American colonies, but withal he does not fail to show how closely they approximated to the parliamentary system of the mother country. The colony of Virginia, beginning in a joint-stock enterprise and a group of farms or plantations, very early evolves a system of representation and a House of Burgesses. Soon the patent of the trading company is revoked, and Virginia becomes a royal province, reproducing the parliamentary and county types of old-English government in the most striking manner. "To the Virginian colonists the difficulty would have lain, not in copying the institutions of England, but in deviating from them." Maryland, too, began like Virginia as an economic venture, although under the authority of a sovereign proprietor. Soon by his special writ were summoned to a miniature parliament at St. Mary's the lords of manors and two burgesses from every "hundred." This body, representing aristocratic and popular elements, was divided in 1647 into an Upper Council and a Lower House, thus bringing "the constitution of Maryland into conformity with that of the mother country and of Virginia." Most interesting is Mr. Doyle's account of the way in which the people of the Carolinas worked out an English constitution for themselves underneath the artificial system which Locke and the proprietary tried to impose upon them. A general view of colonial government is thus stated in few words:

> "As a rule, the constitutions of our American colonies were distinguished by simplicity and by their definite and practical character. We find in them no spirit of ingenuity or contrivance, no trace of any craving for ideal perfection, hardly even adequate respect for definiteness and precision. They were, in fact, direct offshoots from the constitution of the mother country, and, like the parent stock, they had all the characteristics of a system which is the growth of many generations, not the handiwork of one" (p. 355).

It is somewhat remarkable that Mr. Lodge's 'Short History of the English Colonies in America,' published in 1881, should have been so closely followed by two other books upon the same general subject—the one an American work, by Eben Greenough Scott, upon 'The Development of Constitutional Liberty in the English Colonies in America,' the other by Mr. Doyle, representing English scientific interest in the colonial beginnings of the United States. The favorable reception accorded to all three of these works indicates, perhaps, that there is room for all, and that each has a peculiar merit of its own. Mr. Doyle's work, as we have already implied, is most valuable as a constitutional history of the colonies. Mr. Scott is more felicitous in his description of colonial manners, particularly those of the South. Mr. Lodge is strong in his characterization of the economic and social condition of all the colonies at the period immediately preceding the Revolution.

In attempting to write the colonial history of this country from an English point of view, Mr. Doyle has had certain scientific advantages, which partly compensate for the greater wealth of materials and for the power of local coloring enjoyed by his associates upon this side of the Atlantic. He has been enabled by his very remoteness to treat American history with a greater degree of objectivity than could most

American writers, however tempered their judgment. He has enjoyed remarkable facilities for examining colonial documents preserved in the State Paper Office in London. He has been able, as it were, to go behind the scenes and to observe all the interesting arts and appliances by which English stock companies, royal favorites, and business agents of honest men brought English colonies upon the stage of history. Mr. Doyle has viewed the English side of America, and he is consequently better able than most Americans to appreciate the principle of English continuity in our colonial constitution. Men like Doyle, Gardiner, and Freeman perceive clearly, and almost instinctively, the inner connection of things, the relation of events, the ramifications of English liberty, and withal its symmetry and true proportions. Just as Mr. Bryce's study of the "Holy Roman Empire" of the German nation made English students realize the eternal unity of old Rome and modern Europe, so "the continuation of English history" in America by men like Mr. Doyle will develop a stronger sense of historical unity between old England and the United States.

While commending the spirit and general character of Mr. Doyle's work, we may indicate one or two errors of detail, excusable, perhaps, as typographical blunders, or as natural oversights by an author viewing American history from such a distance. Virginians will reprove Mr. Doyle for persistently spelling Lord Culpeper's name with three p's, when not only Culpeper County in Old Virginia, but the Patent itself to Lord Culpeper and others, in the 21 Car. II., as reprinted in Virginia Laws, preserves the true form. Marylanders will not appreciate the reference to "Henry *Clay*, an independent squatter on an outlying portion of the Virginian territory," who aided Calvert in finding a site for his colony. Henry *Fleet* was the man. On pages 289 and 294, the author speaks of Secretary "Sawyer," when obviously *Lewger* is meant, who, by the way, was an Oxford man and a distinguished scholar, converted by the preaching of Chillingworth.

Emerson as a Poet. By Joel Benton. M. L. Holbrook & Co. 1883.

THIS brief essay, which records the personal impression made by Emerson's poetry upon a sympathetic and sensitive mind, aims to obtain a wider recognition and higher estimate for Emerson's poetic faculty. The author does not employ for this purpose any criticism, properly speaking; he dispenses with all academic canons, and pleads as positively as did Emerson for the poet's self-abandonment to the spiritual powers over him. In this way he practically dismisses the usual objections, very pertinently urged by many, that Emerson's poems are rendered more or less ineffective, and so far fail, by their frequent obscurities, their inconsecutiveness of thought, and their crudities in art. It is easy to silence the critic thus, by telling him that his rules are inapplicable; but the reader's difficulties are not thereby removed, and it might have been wiser for one who writes, as Mr. Benton avowedly does, in order to inspire others with his own enthusiasm, to acknowledge at once and clearly the undoubted limitations of Emerson's genius, out of which the initial difficulties in understanding him arise. Mr. Benton does this only incidentally and with evident dislike; for the most part, he simply eulogizes the poems in the choicest words at his command, and even says of his idol that "we must go back to Shakspere and Milton, among English names, to find an equally enormous endowment."

It would not be desirable to notice such an extravagance but for the clearness with which the comparison marks Emerson's failure to be popular. Few poets in the last three centuries have shown so continuous an intimacy and pure a communion with nature as beauty, or so complete and impressive a conception of nature as law; few have been so original, spontaneous, and exact. But a man may be gifted in all these ways and fail of that constant certainty of expression that won for Shakspere and Milton the world for their audience. There are a few unique poems, and many brief passages, of Emerson's which have this power to make themselves known to all; clear as crystal and enduring as adamant, they hold his immortality. But in general he requires in his readers capacities for exaltations purely of the intellect that belong to few men; at his level, he asks unusual powers of attention, because his principal gift as an artist was the condensing faculty—he could put an essay into a couplet without any loss to the mind. Most of his admirers, we fancy, read him fragmentarily, as they would Thomas à Kempis, and so escape the mental confusion that harasses a new reader, who, of course, reads continuously. In brief, Emerson needs an usher to proclaim his titles and give the cue for his proper reception, and an essayist who would perform this service would be gratefully appreciated by the many who do not know what to make of so nondescript a poet at first sight or afterward. In other words, a good preface would be more serviceable to his fame than a thousand eulogies.

This essay, while it shows what Emerson may be worth to a man whose poetic sense has been highly cultivated, does not point out, as such a preface would, the road for common travellers. Its principal value as a guide lies in the quotations, which may captivate anew the discouraged and urge them on to a last attempt. Besides the old well-worn lines, familiar to many who perhaps never opened Emerson's volumes, there are a few new ones, which, if not of the best, were worth rescuing from the winds. One couplet illustrates the hardness of Emerson's workmanship in comparison with Campbell's:

> "A score of airy miles will smooth
> Rough Monadnock to a gem";

and the following quatrain exhibits the startling rhetoric which so often leads the reader to exert some patience to get at the obscure thought it contains:

> "The beggar begs by God's command,
> And gifts awake when givers sleep;
> Swords cannot cut the giving hand,
> Nor stab the love that orphans keep."

These lines have the royal stamp that only the poetic mind imprints; but the value is, as usual, dubious at first, depending much on the hand to which they come. The other new verses had better have been left in oblivion. The concordance to the poems prepared by Mr. Kennedy, and Mr. Poole's list of magazine articles on Emerson, are valuable additions to the volume.

Epochs of the Papacy, from its Rise to the Death of Pope Pius IX. in 1878. By the Rev. Arthur Robert Pennington, M. A., Canon Non-residentiary of Lincoln Cathedral. London: George Bell & Sons. 1882. 8vo, pp. 496.

MR. PENNINGTON'S history is written from the point of view of a pronounced and ardent adherent of the Church of England. When we have said this, we have sufficiently indicated its tone; it should be added, however, that it is not, in any bad sense of the term, partisan, but is as fair and impartial as a man of positive opinions could be expected to make it. For the rest, it is a book of decided merit, the product of careful scholarship, and written in a very interesting style. There is probably no better brief account of this important institution.

Of course this is not an *ecclesiastical* history in the full sense of the term, nor even a history of the See of Rome. While it is impossible to avoid questions of theology and church discipline, the idea associated with the word *Papacy* is nevertheless that of dominion rather than doctrine or place in the hierarchy. A history of the Bishops of Rome must have narrated the interesting series of events connected with that bishopric in the four first centuries; a history of the Papacy may perhaps properly be said to commence with Leo the Great, for he, although not bearing the title of Pope in the exclusive sense in which it is familiar to us, may fairly be called the founder of the Papal power. The period before his pontificate is therefore dismissed in a few pages of very general character. Indeed, the six hundred years which followed are passed over with very brief mention, and the career of Hildebrand forms the real starting-point in the history. From this date, the middle of the eleventh century, to the Reformation, the history is very full and detailed; these five hundred years receiving about 350 pages out of the 500 which compose the volume. The centuries since the Reformation, as might be expected, are less full, but still sufficiently detailed for the needs of most readers.

The growth and decline of the Papal power, which is the most important event of the five hundred years in question, is treated exceedingly well. We question whether the judgment expressed as to Gregory VII. is not too severe. He was no doubt ambitious, but it was, we think, an unselfish ambition, so far as ambition can be unselfish—that is, in the first place, ambition for his order rather than for himself; in the second place, an ambition resting upon a sincere conviction that what he wished to accomplish was what the world most needed. For the rest of the great men who took part in this long contest on both sides, it seems to us that essential justice is done them, and also to the questions at issue from time to time. The temporal power in another sense—the establishment of the Popes as temporal monarchs over the States of the Church—is not so satisfactorily treated. The first step is narrated with such fulness, in an excellent analysis of the fraudulent donation of Constantine, occupying four pages, that we looked to find the subsequent steps in the process described with the same care. But the reader who attempts to trace the formation of the Papal States, and the establishment of an effective power in them, will be greatly disappointed. Mention is made, for example, of certain acquisitions of territory by Alexander VI. and Julius II., but none of the fact that these popes first succeeded in asserting an effective authority over their states which practically made them into kings—a policy of the same character as that of the nearly contemporary sovereigns, Louis XI., Henry VII., and Ferdinand the Catholic.

Mr. Pennington comments with severity and justice upon the intolerance of the Church at various epochs, and upon the iniquity of the persecutions. It is, therefore, somewhat inconsistent when (p. 83), after describing the views of Abelard, he adds: "We have reason to be grateful to St. Bernard that he wielded all the power of the Papacy for the suppression of these and similar opinions; for otherwise, aided by the corrupt passions and propensities of human nature, and by the extraordinary popularity of Abelard's writings, they would have been propagated silently and gradually seven centuries ago through the length and breadth of the Continent of Europe." Is persecution to be condemned only when directed against opinions which Mr. Pennington approves, and not also when directed against those which he considers heresies?

We find a few misprints. Charlemagne was

made Patrician (p. 24), not Patriarch. It was not the Pope (p. 33), but the Emperor who had a veto upon Papal elections. Nicholas III. became Pope in 1277 (p. 142), not 1272. The Pope who approved of the massacre of St. Bartholomew (p. 377) was Gregory XIII., not Gregory IX.

Hygiene for Girls. By Irenæus P. Davis, M.D. D. Appleton & Co. 1883. Small 8vo, pp. 210.

THIS little volume deserves a warm welcome from all who desire to save young girls from the suffering which so often arises from "ignorance that is criminal because unnecessary." The author dedicates his work to Dr. Sims, "in the hope that it may aid in some measure to avert from the women of to-morrow the suffering that it is his gracious mission to alleviate for the women of to-day." The general scope of the work may, perhaps, be best understood from the following enumeration of the headings of the chapters: I. Nerves and Nervousness; II. Habit and Association; III. Sympathy and Imagination; IV. Organs peculiar to Women; V. Feminine Employments; VI. Amusements; VII. Social Customs; VIII. Harmony and Elements of Beauty; IX. Hygienic Morals.

In the first chapter, the author endeavors to correct popular misapprehensions in regard to the functions of the nerves, and the real meaning of the word "nervous." We find here also an excellent discussion of the extent to which victims of so-called nervous irritability are really responsible for their actions. In the chapter on amusements, the author lays down the principle, "that while some amusements, of a nature very different from one's occupation, are useful and necessary, still, when their object is mere recreation to the wearied powers, without reference to the discipline and development of other powers, there is special advantage in such as are somewhat allied in character to the occupation, provided they are not identified with it too closely. . . . Thus it is that scholars are apt to find their principal amusements in affairs which involve mental exercise, and those who are not scholars naturally seek theirs in exercises more purely physical." The most suitable age for marriage is discussed in the chapter on social customs, and the conclusion is reached that "in this country no girl ought to marry under twenty years of age, and few are fit for it under twenty-two or twenty-three," the reason being that "maturity of strength and endurance do not come till some time after maturity of form and of organization has been reached."

In the fourth, and also in the ninth chapter, the author conveys a great deal of useful information of a sort which is too often, from a false feeling of delicacy, withheld from girls by their parents and teachers, and for the want of which they often go out into the world poorly prepared for its duties and responsibilities. The language in which these subjects are discussed is unexceptionable, and the book is in every respect one which those who are responsible for the education of young girls need not hesitate to place in their hands as soon as they are old enough to understand the matters of which it treats.

L'Italie qu'on voit et l'Italie qu'on ne voit pas. Par Auguste Brachet. Paris. 1882.

FROM a psychological point of view, this is a very curious book. The author starts with a proposition which we are by no means disposed to admit—namely, that the doctrine of nationalities has already caused, and will cause, more wars than the religious quarrels of the earlier days, or the dynastic quarrels of the later; that the passions excited are more terrible, and the resentments more bitter and durable. What we object to is not so much the assertion of facts, which for the present, and it is to be feared for the future, unfortunately do not admit of dispute, but the assignment of cause. What country was ever more peaceably disposed toward its neighbors than the United States? Our civil war, instead of being caused by nationality, sprang from a disease which threatened nationality, and the triumph of the principle saved this continent from unspeakable woes. If by "nationality" we mean the voice and will of the nation, what was it but the mass of the working people of Great Britain which preserved us from foreign intervention during that war? Certainly, it was not the "court circles" or "cultured intelligence" which refused to join Louis Napoleon in lending substantial aid to the Southern Confederacy. In the Russo-Turkish war of 1878 it was the nation standing behind Mr. Bright, Mr. Gladstone, and others of their class which kept the aristocracy from plunging into the fray, as they would have done and did do thirty years ago. It is their responsibility to the nation which makes the Government so anxious to avoid the appearance of conquest in Egypt, and to get out of it as soon as they can provide any stable administration.

If the state of things is different on the Continent, there is a cause amply sufficient to explain it without having recourse to nationality—namely, that most terrible of modern political engines, the conscription. The armies of Louis XIV. and Frederick II. were no doubt recruited in very lawless fashion, and the "crimp" was a very important Government official. But it was reserved for the state in the nineteenth century to lay its grasp upon every able-bodied citizen, to impress it upon him that readiness to fight is the first duty of man, and that he must not only give his body for that purpose, but largely of his substance for procuring the most costly and elaborate instruments of offence and defence. Moreover, this system, by its very nature, must be strained to its utmost, because the emulation which is justified by the necessities of defence compels each nation not only to exhaust all its resources, but to stimulate its citizens to a consciousness of, and even an eagerness for, the sacrifices which may be required of them. But the system is strongest precisely where dynastic and royal traditions of divine right are in full force, as in the German Empire. As soon as the people have any real voice in the matter, the fabric begins to totter. It is hardly too much to say that there is no danger that France will engage in an aggressive European war as long as the Republic lasts. An attack from the outside, or a military leader seizing despotic power (the latter, indeed, as a very probable consequence of the former), might again lead the nation to organized slaughter, but it will be no movement of the people.

M. Brachet complains that in both Germany and Italy the Governments, in the organizing of national festivals and of instruction in schools, studiously impress upon their peoples a spirit of hostility to France. His special subject being Italy, he goes into an elaborate examination of the text-books used in the primary and secondary, the military and papal schools. There are many advantages in a supervision of education by the state, but it must be admitted that the book-agents who make life a burden to our school committees at least do not use their publications as a means of propagating hostility to our neighbors. It seems to us that M Brachet furnishes herein the argument for his own refutation—namely, that the fault is not with the peoples, but that which fills every page of history—the abuse of popular passions by rulers and demagogues for their own purposes. It is the education of the people to the point of refusing to submit to such abuse which may be reasonably looked to for putting an end to wars.

If there was ever in the world a case of justifiable national antipathy, it might seem to be that of the Italians for the French. From the first invasion of Charles VIII. down to the fall of Louis Napoleon at Sedan, the connection between the nations is a history of insult, humiliation, and misery for the weaker. The hand of Austria has been indeed hard and heavy for a century past; but it was in the support of tyrannies to a considerable degree local, native, and peaceful. The Spanish government of Naples was one of the most disgraceful in European history, but it was confined to a small part of the peninsula. Neither involved, as was the case with the French, whole centuries of stirring up of purposeless civil wars. One cannot help a feeling of sympathy on reading the anecdote told by M. Brachet of Alexander of Este. That prince was in alliance with the French when, through a false manœuvre, a body of the latter came between his troops and the enemy: "Fire just the same," he said; "they are all foreigners."

M. Brachet takes offence because the Italians, in their joy at getting rid of the stranger, celebrate the centennial of the Sicilian Vespers of 1282. Imagine the London *Times* making it a serious international grievance that the Americans celebrate the centennial of the battle of Lexington or the surrender at Yorktown. It may be rather trying to read in Italian geographies that Nice and Corsica are parts of Italy "temporarily in the possession of France," or that the Minghetti ministry in 1876 obtained the concession of a commercial treaty from the French by a feint of concentrating troops in the neighborhood of Nice; but we think M. Brachet hardly gives the Italians sufficient credit for the fact that in the tempting period of 1870-71 they did abstain from the attempt at recovering Nice and Savoy. We wonder if he has asked himself whether, supposing the circumstances had been reversed, his countrymen would have exercised a similar self-control.

We sincerely regret that the Italians have thought it necessary to incur such heavy expenditure upon their army and navy, and that they have not devoted themselves more exclusively to internal reforms, though we believe that their descendants will in this respect have no reason to be ashamed of the history of the last ten years. We have also a certain sympathy for the bitterness with which a Frenchman feels that his country, like a reigning beauty upon whom the ravages of time begin to tell, is losing the place of first importance in Europe. But it is not to a spirit like that displayed in this book that the best friends of France must look for the principles of enlightened and peaceful popular government under a Republic.

BOOKS OF THE WEEK.

Berly's British, American, and Continental Electrical Directory and Advertiser. George Cumming.
Gordon-Cumming, C. F. At Home in Fiji. 2d ed. A. C. Armstrong & Son. $1 25.

"For Family Worship.

Part I. *SCRIPTURE READINGS.*

Part II. *FAMILY PRAYERS.*

Edited by LYMAN ABBOTT, D.D.

1 vol. 12mo, cloth, red edges, . . $1 50.

Part I. contains a course of Daily Readings, of suitable length and character, and arranged on a plan calculated to add greatly to the interest and profit of Family Worship.

Part II. contains Prayers, not written for the book, but selected from all that is best in the literature of devotion.

To those who have Family Worship, with extempore prayer, this fresh course of Scripture Readings will be invaluable. Those who use written prayers will here find a new collection which is believed to be better adapted to present wants than any of those heretofore published.

Convenient and comprehensive, it is a complete Manual of Family Worship.

NOTEWORTHY BOOKS

READY NEXT WEEK:

The Freedom of Faith.

By T. T. Munger, author of 'On the Threshold.' 1 vol. 16mo, $1 50.

A book of discourses which merit, and are sure to receive, such attention as very few books of sermons either receive or merit. They combine in a rare degree the alert, progressive, liberal spirit of the age with the faith and reverence which conserve and characterize true religion in all ages.

From Ponkapog to Pesth.

By Thomas Bailey Aldrich, author of 'Marjorie Daw,' 'The Story of a Bad Boy,' etc. 1 vol. 16mo, $1 25.

Travel-sketches, mostly in Europe, marked by careful observation, interesting comment on personal and national traits, a delicious humor, and that charm of style which makes all that Mr. Aldrich writes so delightful reading.

The Quaker Invasion of Massachusetts.

By R. P. Hallowell. 1 vol. 16mo, $1 25.

Mr. Hallowell has made an exhaustive study of the persecution of the Quakers by the authorities of the Massachusetts Bay Colony, and in this book he tells the pitiful story very clearly, correcting many inaccuracies in the histories which have generally been accepted as authentic.

The Nation.

NEW YORK, THURSDAY, MAY 3, 1883.

The Week.

INLAND navigation on the lakes and rivers has been practically reopened within the past week, and may be expected to impart increased activity to business. Foreign immigration is increasing, and, in connection with it, there is a larger immigration than was ever known before from Canada to the new Northwest, passing through Chicago and other Western points. The condition of the winter wheat crop has been greatly improved during the past fortnight, and the progress of seeding for the spring wheat crop has been very satisfactory. On the whole, the prospect for a full average crop of wheat has improved at least 5 to 8 per cent. The troubles between owners and employees in the Western iron mills have not been settled, but there are indications of concessions on the part of manufacturers which may possibly yet avert a strike. There is, however, still so wide a difference of view that it is doubtful if it can be overcome. Financially, the past week has presented no special feature except the increasing demand, both in this country and in Europe, for first-class railroad bonds. Within the past ten days several of the most important loans ever put out by railroad corporations (including some which have been in process of negotiation for several years) have been either finally absorbed by the public, or bid for by syndicates of bankers who desire them to supply the public demand. Among these may be mentioned the last $10,000,000 of the Northern Pacific bonds; $3,000,000 of Union Pacific bonds; $5,000,000 of proposed New York, New Haven and Hartford bonds; and $3,000,000 of the Oregon and California bonds. Altogether there have been at least $25,000,000 of railroad bonds taken by syndicates of bankers in ten days. The money market has continued well supplied, both here and in Europe, but the demand for either investment or speculation does not seem to extend to the stock market yet, and prices of railway stocks are lower than a week ago.

The following very extraordinary resolution has passed the Massachusetts Senate and is now before the Lower House of the Legislature:

"In view of the great services of Oakes Ames—representative from the Massachusetts Second Congressional District for ten years ending March 4, 1873—in achieving the construction of the Union Pacific Railroad, the most vital contribution to the integrity and growth of the national Union since the war; in view of his unflinching truthfulness and honesty, which refused to suppress in his own or any other interest any fact, and so made him the victim of an intense and misdirected public excitement, and of a vote of censure by the Forty-second Congress at the close of its session; and in view of the later deliberate public sentiment, which, upon a review of all the facts (and especially since the decision of the Supreme Court of the United States vindicating him and the Crédit Mobilier of America of any fraud on the Government), holds him in an esteem irreconcilable with his condemnation, and which, throughout the whole country, recognizes the value and patriotism of his achievement and his innocence of corrupt motive or conduct; therefore, the Legislature of Massachusetts hereby expresses its gratitude for his work and its faith in his integrity of purpose and character, and asks for a like recognition thereof on the part of the national Congress."

The Crédit Mobilier scandals of 1873 are no longer quite as fresh in the memory of men as they once were, but they are fresh enough not to permit anybody, not even the Legislature of so respectable a State as Massachusetts, to confuse people's minds about their character. The resolution above quoted tries to persuade us that those who were censured for their participation in the Crédit Mobilier affair were the "victims of an intense and misdirected public excitement." But when it is remembered that the excitement was directed against the practice of influencing the votes of Congressmen by distributing valuable securities among them, "where they would do the most good," it will also be remembered that the public excitement was not misdirected at all, and that it would do the country an immense deal of good if we could have such an excitement in every similar case.

The resolution is undoubtedly intended to soothe the feelings and to burnish over the escutcheon of the family of a man who did many good and useful things, and who possessed many excellent traits of character, but who, in order to carry his ends, used means calculated to demoralize our public life in a very dangerous manner. The resolution extols Oakes Ames for having "achieved the construction of the Union Pacific Railroad, the most vital contribution to the integrity and growth of the national Union since the war." Nobody denies that Oakes Ames did very much toward that end. Nobody censured him for having carried out a great public work, but he was censured for the means he used in doing it. The resolution extols his "unflinching truthfulness and honesty, which refused to suppress, in his own or any other interest, any fact." Everybody respects that unflinching truthfulness, and nobody denies that he possessed it. But he has been censured because that truthfulness compelled him to admit that he had used corrupt means to create certain prepossessions in the Congressional mind. Oakes Ames was a business man of great enterprise and energy, who, in his eagerness to accomplish great results, occasionally failed to remember that the moral tone of our public life is a matter of much higher consequence than even a great railroad. Nobody will find fault with his family and his friends who, in view of his many excellent qualities, take a charitable view of his failings, and commend that charitable view to the general public. But they make a mistake if they treat this as a mere family affair, and at the same time challenge public sentiment all over the country with regard to it.

General Crook's expedition against the hostile Apaches seems to have come to a dead halt at the Mexican border. Some time ago we were informed that an understanding had been arrived at between the Government of the United States and that of the Mexican Republic, in pursuance of which, in case of hostile Indians passing the line between the two countries, our troops might cross into Mexico or Mexican troops into the United States, in pursuit of them. As is their custom, the hostile Apaches who recently committed so many murders in Arizona sought shelter on Mexican territory as soon as our troops moved upon them. General Crook then organized an expedition with a view to following them across the Mexican line and destroying them in their places of refuge, in accordance with the understanding above mentioned. But at the frontier he is arrested by an order from Washington which bids him stop. And now we learn that Señor Romero, the Mexican Minister, has "put himself in telegraphic communication with his Government with reference to the representations made to him by Secretary Frelinghuysen, on the subject of obtaining consent for United States troops to cross the Mexican border in pursuit of raiding Indians." From this it would appear that, if there is any understanding, as above mentioned, at all, it is worthless in effect as to the present emergency. The Apaches are in the habit of moving about briskly, and if a campaign against them is to be subject in its progress to diplomatic negotiations with the Mexican Government, the savages may laugh at their pursuers. Mr. Romero does not seem to be in any hurry about the matter, since he expresses himself in favor of correspondence by letter with his Government in preference to using the telegraph more than he has done already. And inasmuch as his letters will not reach the city of Mexico for two or three weeks, and the Mexican Senate, upon whose consent the arrangement seems to depend, will then be ready to adjourn, he sees no prospect of doing anything this season. It is not clear, however, why under such circumstances General Crook was permitted to start on his expedition at all.

In the meantime another phase of the "Indian trouble" is illustrated by another kind of savages. While General Crook is on the Mexican border, the "Tombstone Rangers," an organization of white ruffians, seem to have resumed their scheme of "wiping out" the peaceable Apaches on the San Carlos reservation. United States troops have been placed there to protect the Indians, and the Indians have also been organized and armed to defend themselves. It is expected that, if the "Tombstone Rangers" really venture to make an attack upon the reservation Indians, the latter, with the aid of United States troops, will "make it hot" for them. Thus we have the singular spectacle of an expedition of soldiers, reinforced by Indian scouts, organized for the pursuit of Indian marauders, and at the same time another defensive organization of peaceable Indians, reinforced by United States soldiers, against an attack by white ruffians.

Dr. George M. Beard, who died in this city, was, it was well known, an agnostic, or, as he called himself, a "scientist," and was generally supposed to have remained so till his death. He had, however, a Moravian woman for a nurse in his last illness, who seems to have since fallen into the way of Mr. Joseph Cook, the Boston "Monday Lectureship," just as he was getting his facts and illustrations ready for a "prelude." She told him that Dr. Beard had died a believer; that in his last moments she had said to him, "Trust in Jesus!" and that he had answered promptly, "I do—I am"; and that subsequently he had risen up in bed, and exclaimed "Higher, higher," which the nurse reported as a pious ejaculation. This was enough for Mr. Cook, who is always as receptive as a little child when he is preparing a prelude, and it is right to add that it was probably as good evidence as that on which nine-tenths of his discourses are based. He accordingly dressed up the Moravian woman's story in the following characteristic fashion, apparently without the slightest inquiry or verification:

"When Dr. George M. Beard lay dying in New York city, a devout Moravian said to him: 'Trust in Jesus.' With unimpaired faculties, he answered: 'I DO. I AM.' Immediately after this he rose up in bed and lifted up his hand, his face brightened and he said with great emphasis: '*Higher!* HIGHER!' and, in a few seconds, passed into that trance from which no man or angel could waken him."

Now come the family of the deceased gentleman, who were around his bedside at the last moment, as well as a friend, and testify that he was then almost completely deaf, and had been so for some time, as the result of his disease. He could only be made to hear through an ear-trumpet, if at all. No such exhortation to him as the Moravian nurse reports herself as having made was heard by any one else in the room, or could have been heard by him. His last words were, "Higher, higher," which were taken to mean, as he was suffering from difficulty of breathing, that he should be raised up in bed, and he was so raised, and he confirmed the interpretation put upon them by adding "That will do," when he had got into the right position. In that position he died without another word, so that the Moravian nurse seems to have drawn on her imagination. Dr. Beard continued, as long as he was able to converse, an agnostic, and, all his friends say, so died.

The *Independent*, which made an article out of Mr. Cook's story, now withdraws it, and adds:

"If the collapse of this story of death-bed conversion shall do anything to prevent the abuse of the great truth, that so long as moral power exists there is the theoretical possibility of conversion and salvation—whether in health, or sickness, or death, whether on earth, or in purgatory, or in hell—we shall be glad."

This is all very good, as far as it goes, but it does not go far enough. What "the collapse of this story of death-bed conversion" ought to check is not simply "the abuse of a great truth," but plain falsehood, and the reckless conversion of signs and wonders into moral pabulum. Truthfulness, strict truthfulness, and careful examination of facts, are the lesson of this collapse for all preludemongers, lectureships, and other moral and religious teachers. The value of truth, its supreme, overwhelming importance, is the lesson of every death-bed, and is furnished by that of an agnostic or scientist, as well as by that of a Christian. On this point Mr. Cook's teaching is of vastly more consequence, to himself at all events, than his opinion as to the exact limits of probation.

The Rev. Anna Oliver, of the Methodist Episcopal Church, informed her congregation in Willoughby Avenue, Brooklyn, on Sunday, that, owing to the steady refusal of the denomination to recognize her or her church on account of her sex, she was going to give up her ministrations. The occasion seems, however, to have been by no means a sorrowful one, for she was able to make an excellent statement of her affairs from a purely mundane point of view. She had bought the church from the mortgagees for $13,000 in 1879, and had made it pay its expenses ever since "without fairs, raffles, or worldly entertainments," but owing to this difficulty about her sex it was now determined to sell it. The trustees told her that she might keep whatever she could get over and above the mortgage of $13,000. So, being apparently an able business woman, she has sold for $18,000, which gives her $5,000 in cash, and it is not surprising to hear, under these circumstances, that her only plan as yet for the future "is to take a vacation." We need hardly say that she is going to Europe, therefore, after a "month's rest and literary work," seeing and "studying" England on her way, and then going straight to Jerusalem by way of Florence.

The Irish National League completed its organization on Friday and adopted a platform. This document consists, as was natural, in what is called at political conventions an "arraignment" of England, embodied in language of extreme violence and exaggeration, so that on a moderate computation only about half of its charges are true, and some of the worst of them—such as having practised on the Irish "every form of cruelty known to the lowest savage"—must refer to a very early period in modern history, when Irishmen themselves had not by any means acquired that gentleness and magnanimity in their treatment of enemies for which they are now distinguished. It is needless to say that a calmer and more accurate statement of the Irish case against Englishmen—the terrible strength of which the best Englishmen acknowledge with much penitence—would have been more effective with the world at large. But this was not drawn up for the world at large. It was drawn up for the 2,000,000 Irishmen and Irishwomen now in this country, who are to furnish the new League with its funds and support, and who like their rhetoric both hot and strong, and, in fact, would have been much disgusted if their representatives had denounced the oppressor in moderate language. As it is, the platform is, however, not much more violent, if any, than an old-fashioned Democratic arraignment of the Republican party during the war, or a Republican rehearsal of Democratic doings at the South during the "outrage" period. The fifth plank, which purports to give some account of the anomalies in the present government of Ireland, is the only one which makes any approach to sobriety or accuracy, or which a foreigner can read with any profit.

The objects of the new League, as described in the constitution, are as near being practical as those of such an organization established on foreign soil, three thousand miles from the country it is intended to benefit, can be expected to be—the instruction of the American public about Irish grievances, the encouragement of Irish manufactures, and of the cultivation of the Irish language and music, the "boycotting" of English manufactures, and the "abolition of sectional feeling" among Irishmen. The thing which would perhaps have done most to conciliate or win over American opinion about Ireland, was some formal and emphatic repudiation of the policy of murder and outrage, but this was, we are sorry to say, omitted. The only allusion to the murder cases now pending in Ireland consisted simply in the old-fashioned denunciations of the judge, jury, witnesses, and police which Americans read with so much pain. The dynamite men were kept in the background, but apparently only as a matter of too thinly-disguised policy.

The puzzle to which we have more than once referred, presented by the attitude of the Irish Catholic conscience towards murder and murderers, was increased considerably, recently, by the statement of Father Walsh, a priest who has acted as Treasurer of the Land League in this country. He reported that he had transmitted $376 to the Widow Walsh, one of whose sons was hanged and the other sentenced to penal servitude for life for murder, under Mr. Parnell's advice, who believed in their innocence. Father Walsh then added that Mrs. Walsh not only knew her boys to be innocent, but knew who committed the murder for which they suffered, but would not tell, preferring to let her children be hanged to turning informer, as "some ignoble villains" were now doing. What we should like to know is, whether a Catholic clergyman can really approve of a mother's allowing her son to go to the gallows for a crime he did not commit, sooner than point out the real perpetrators to the officers of the law—no matter whose law; and whether he thinks no bloodguiltiness rests on that mother's head. If this woman is a good Catholic, and her conduct in this matter be in accordance with what Irish Catholics consider the duties of good citizenship, we imagine there are very few persons outside the Land League who would care to live in a state in which Mrs. Walsh's style of patriotism was at all common.

The last deliverance of the London *Times* on the Irish question is both melancholy and instructive reading. In fact, it explains in a few words how there ever came to be an Irish question. It says, apropos of the Irish Convention:

"The only practical suggestion made by the Convention for injuring Great Britain is the advice to the people of Ireland to buy nothing from

England unless they are obliged to. It is a confession of impotence when Irish malice is driven to such a paltry expedient, which, if tried, would only injure its adopters. The lesson for Great Britain is to ignore Irishmen, and abandon the hope of bringing them to a better frame of mind by a continuance of unmerited favors. They have already convinced the rest of the world that they are unfit to have national independence, and they must be made to feel the strong hand of the law."

It is talk like this on the part of Englishmen, begun two hundred years ago, and used in reply to every Irish demand, beginning with the demand for the commonest civil rights, which has produced the Ireland of to-day, and which has begotten that passionate hatred of English rule which every race that has ever lived under it, even when it was wisest and most humane, has felt—the Dutch of the Cape of Good Hope, Protestant and Teutonic though they be, just as deeply as the Connaught peasantry. It is the kind of talk which every man of every such race, when he can do no better, feels inclined to answer with the bullet and the knife and the bomb. It is the kind of talk, too, which the *Times* contributes to nearly every controversy in which England happens to be engaged with a people from whom it thinks she has nothing to fear. It is not more insulting or exasperating than most of the articles on American affairs in the years 1861–3, but it is less statesmanlike, because the American trouble was very near solution, while the Irish one, we fear, is not.

Mr. Thompson, a Congressman from Kentucky, has been killing a man named Davis. His wife has been given to drunkenness, and hearing that she had been behaving improperly with Davis, at a hotel where he had left her, the opportunity of doing a little killing seemed to him to be too tempting to be lost. So he prepared to shoot Davis "on sight," and, seeing him in the train, he shot him accordingly, and the body rolled off on the track. He then returned and surrendered himself to the court, with a beautiful and pathetic speech. This little affair recalls to the local press the tragedy of six years ago, when Thompson was Prosecuting Attorney at Harrodsburg. The Thompsons had had a long family feud with the Davieses over a lawsuit. So, being all in court together at the trial of the case, they fell to, and old Philip Thompson, young Philip (the present slayer), and another son, killed old Davies and his two sons—so to speak, *coram judice*.

But the Kentucky papers begin to doubt whether Thompson was justified in shooting Davis under any code, or, in other words, whether Davis had done him any injury. The evidence in Thompson's possession, at all events, seems to have been of the flimsiest sort, and he commited the murder some days after he had heard of the offence. In short, taking the best view, he acted in cold blood as judge, jury, and executioner in his own case, without hearing the accused. It is no answer to this to say that "his manners are easy, and in walk and conversation he is as gentle as a woman," or that "he is the gamest little man that ever trod in shoe-leather," or that "he rode into the thickest of the fight in Morgan's cavalry" when only seventeen, or that "Phil Thompson would not have done this deed if he did not sincerely believe that he was an outraged man." That may be, but things would come to a pretty pass in a civilized country if everybody who "sincerely believed" that you had outraged him in some way was allowed to kill you on sight. Even if Phil Thompson is to be allowed to do his own killing, he ought at least to take testimony first, and hear the prisoner. We suspect that the remark of the old Scotch Judge, Lord Braxton, to the culprit who made a very fine speech in his own defence, is not wholly inapplicable to Phil Thompson's case: "You're a vera clever chiel, mon, but ye'll be nane the waur of a wee bit hangin."

The unexpectedly large vote in the House of Commons in opposition to the grants to Lord Wolseley and Lord Alcester, for their services in the Egyptian campaign, shows that the hostility to Jingoism has by no means died out, and that, in fact, it gains ground. However justifiable the war in Egypt may have been, the victory over Arabi was not a remarkable one, either by sea or land. His defence was of the most feeble kind, and yet the rewards bestowed on the General and Admiral who overcame it are almost as great as Wellington received for driving the French out of Spain when Napoleon was in the height of his power. As a matter of fact Wellington was not raised to the peerage till many years after his wonderfully brilliant campaign against the Mahrattas, including the battle of Assaye, in which, on open ground, with a force of 4,500 men, of which only half were British, he drove 50,000 Mahrattas, with 100 guns, from the field; nor till after he had opened the Peninsular campaign by defeating Laborde at Rolica, and Junot at Vimeiro and Talavera. The *Spectator* defends the large grant of money in these cases—the equivalent, in an annuity for two lives, of $150,000—on the ground mainly that the ordinary compensation given to soldiers and sailors is small, and that men could not be induced to endure the monotony and poverty of the military service in time of peace if the war prizes were not large. But on the other hand large war prizes furnish a powerful stimulus to Jingoism among the very influential class in England from which naval and military officers are still drawn, and account in a considerable degree for the ridiculous worship which the Tories are now offering to the memory of Lord Beaconsfield.

It is now reported from Berlin that the attack upon our Minister, Mr. Sargent, by the *Norddeutsche Allgemeine Zeitung* will probably not result in Mr. Sargent's resignation or his withdrawal from Germany by this Government. We do not see why it should, for Mr. Sargent did no more than what would be expected of every faithful diplomatic representative. The difficulty arose not from the fact that he had written a despatch displeasing to Prince Bismarck, but from the publication of that despatch. This occurrence should, therefore, serve as another reminder to the State Department of the necessity of carefully examining the despatches of our ministers before they are printed, for the purpose of striking out from them passages which might embarrass our diplomatic agents in their relations with the governments to which they are accredited. Unless this be done our ministers will not only get into all sorts of disagreeable situations without any necessity, but—and this will be a far more serious evil—they will, in order to avoid being thrown out of their places, be naturally inclined carefully to abstain from writing to the Secretary of State anything the publication of which might result in unpleasant feelings, and therefore not be as truthful and outspoken as they ought to be. In other words, their principal usefulness, which consists in giving correct information to their Government, will be very materially impaired. It is evident that ministers who report only what it would be pleasant for the foreign governments to hear will be of no use. They must therefore be assured that they can count upon the discretion of the State Department, so as not to be put in danger of losing their places by indiscreet publications if they report what is not pleasant for the foreign governments to hear.

After much bargaining and haggling, the Porte has finally consented to the demand of Austria-Hungary that Vranya, at the southern extremity of Servia, should become the point of junction for the Servian railway to be built under Austrian auspices and a branch of the Turkish railway now running from Salonica, on the Ægean Sea, in a straight line to Mitrovitza, in the Sanjak of Novi-Bazar. The Servian railway is to begin at Belgrade, on the Danube, where it will connect with the Austro-Hungarian lines of communication, and run through the valley of the Morava to the aforesaid extremity of the kingdom, where this borders on both Turkey proper and Bulgaria. Austria-Hungary was anxious to have a connecting branch leading from Vranya to Uskup, on the Varder, which would have been the shortest and least expensive link; but the Porte insisted on making the connection further north, between Mitrovitza or Prishtina in Turkey, and Alexinatz or Leskovatz in Servia. Such a northern line would leave the strategically important pass at the Kara Mountain unpenetrated by Austro-Servian locomotives. The negotiations threatened to become interminable, but the Austro-Hungarian Minister to the Porte succeeded in making the latter accept a proposition which saves her military scruples, but also half satisfies the other contracting parties. The connecting line is to be carried from Vranya, but, instead of to Uskup, to Prishtina, north of the strategic pass and of the battle-field of Kosovo Polye, famous in Turkish history. This arrangement makes the future great railway line between the Danube and the Ægean about sixty miles longer than it ought to be, but it gives Servia a commercial artery extending throughout the entire length of the country, and carries the direct influence of Austria-Hungary to a point in the Balkan Peninsula more southerly even than the south frontier of Bosnia, and situated on the flank of Bulgaria, where Russia's influence predominates.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 25, to TUESDAY, May 1, 1883, inclusive.]

DOMESTIC.

AT Horticultural Hall, in Philadelphia, on Wednesday, the long-talked-of Land League Convention was called to order. About 800 delegates were present, and gave enthusiastic attention to the day's proceedings. Frank Byrne, Patrick Egan, and Mrs. Parnell were among those present. President James A. Mooney, of Buffalo, delivered the opening address, in which he strongly endorsed the course of Charles Stewart Parnell, expressed extreme confidence in Patrick Egan's disposal of the League funds, and stated the object of the proposed reorganization of the League. The address was well received. After a long debate, which was at times disorderly, a committee was appointed to furnish a plan for the merging of the Land League with the National League, and after their report a resolution was passed providing for an adjournment of the Land League *sine die* if the National Convention should agree to their plan of reorganization.

On Thursday the Irish-American National Convention assembled in the same hall, about twice as many delegates being present. At 12 o'clock Alexander Sullivan, a young Chicago lawyer, delivered the opening address, which consisted mainly in appeals to Irish sentiment and passion. The Rev. Maurice J. Dorney, of Chicago, was made temporary Chairman. There was considerable disorder during the time when the organization was being perfected, and there were objections to the methods by which the nominations were made and carried. At the afternoon session a telegram from Mr. Parnell was read, in which he said: "I would respectfully advise that your platform should be so framed as to enable us to continue to accept help from America, and at the same time avoid affording a pretext to the British Government for entirely suppressing the national movement in Ireland. In this way only can unity of movement be preserved, both in Ireland and America." On Friday afternoon the Committee on Resolutions made a report, which was adopted with few dissenting votes. The platform arraigns the British Government for misrule; pledges the unqualified support of the League to their countrymen in Ireland in their efforts to recover national self-government; urges upon Irish farmers the cause of the laborers; recommends that Irishmen purchase nothing from England which they can produce at home or buy from America or France; condemns the English Liberal Ministry; and approves Patrick Egan's course as Treasurer of the Land League. A plan of organization was adopted which stated the objects of the Irish National League of America to be, to sustain the League in Ireland; to procure a clearer understanding by the American people of the Irish question; to promote the development of Irish manufactures by encouraging their import into the United States; to encourage the study of the Irish language, music, and art; to "boycott" English manufactures, and to abolish all sectional feeling of province and creed. Alexander Sullivan was elected permanent President. (He killed Francis Hanford in Chicago in 1876 for slandering his wife, and was acquitted on a second trial.) A national committee, which elected an executive committee, was appointed, and the Convention adjourned.

Upon the recommendation of the Civil-Service Commission, President Arthur on Wednesday appointed Randolph De B. Keim, of Pennsylvania, to be Chief Examiner of that Commission. Mr. Keim was selected out of a large number of applicants. He had the recommendations of a great many politicians, many of them pronounced "Stalwarts." He has been a Washington correspondent of considerable success, but has always devoted his energies to the cause of the Stalwarts, and has been an enthusiastic supporter of the Camerons and General Grant. On Tuesday a long letter from Dorman B. Eaton, one of the Commissioners, was published in defence of the appointment.

W. W. White, of Atlanta, Ga., was appointed secretary of the Civil-Service Commission on Wednesday. He is a friend of Dr. Gregory, one of the Commissioners, and a college classmate of his son. The latter had been selected to take charge of Mr. White's business while he was acting as secretary. It was immediately telegraphed to certain newspapers that Mr. White's nomination was a mere subterfuge to cover a good position for young Gregory. Mr. White thereupon telegraphed his resigna tion, asserting that he would not permit his name to embarrass the Commission or Dr. Gregory. He said that he accepted the place only for the public good, as his business in Atlanta is worth $500 a month, while the salary of secretary is $1,600 per year.

Secretary Folger on Wednesday decided that granulated rice is liable to duty only at 20 per cent. ad valorem as an article manufactured in whole or in part. He also decided the long-contested petty appointment of Gilbert against Wright to be Deputy Collector of the port of Chicago in favor of Gilbert, confirming the removal of Wright by Collector Spalding. This will be considered a personal affront by both Senators Logan and Cullom, who have made common cause in insisting that Wright should be retained.

An important band of counterfeiters was arrested in this city on Saturday, charged with making and circulating spurious trade and Bland silver dollars.

General Green B. Raum, Commissioner of Internal Revenue, tendered his resignation to the President on Saturday, to take effect on April 30. He desires to engage in a more remunerative private law practice.

Mr. Ker's speech for the Government in the Star-route trial was continued without any particular incident on Wednesday, Thursday, and Friday, being concluded on the last-named day. Counsel for Miner and Vaile offered to submit their cases without further argument. The offer was refused, and Mr. Bliss began to speak for the Government on Monday, continuing on Tuesday in a very caustic vein.

Ex-President Rutherford B. Hayes, and the Board of Trustees of the John F. Slater educational fund, of which Mr. Hayes is President, met in this city on Wednesday to hear the report of the Rev. A. G. Haygood, of Georgia, the general agent of the fund. The report was submitted on Thursday. It was incomplete, and no action was taken upon it. The Board decided to initiate their work by an appropriation of $20,000, to be expended under the direction of Dr. Haygood during the year 1883. The aid is to be given to such schools as are best fitted to prepare young colored men and women to become useful to their race, and it is recommended that they be taught some manual occupation simultaneously with their mental and moral instruction. The Board adjourned to meet in October.

Governor Cleveland on Friday nominated W. H. Murtha, of Brooklyn, for Emigration Commissioner, and Willis S. Paine, of New York, for Bank Superintendent. Mr. Murtha is a Democrat, and was State Senator in 1880. Mr. Paine is a lawyer of ability, and was one of the commissioners who recently compiled the Banking Laws of the State. There were three Court of Claims Commissioners nominated at the same time. All the nominations were immediately confirmed by the Senate, with the exception of the first. The Tammany men refuse to accept Mr. Murtha.

At Albany, on Wednesday, the Senate, by a vote of 15 to 7, took from the table the adverse report of the Railroad Committee on the Anti-Free-Pass Bill, and committed the bill to the Committee of the Whole. On that day Governor Cleveland returned to the Assembly, without approval, the bill for the relief of the surviving members of the First Regiment of New York Mexican Volunteers. It provides for the payment of $12 per month in quarterly payments for two years to every person who shall appear on due evidence to have been a member of the regiment referred to, and appropriated for this purpose $14,976. The Governor is by no means certain that the legislation thus proposed involves correct principles, or that the appeal upon which it rests should be answered by favorable action. A motion in the Assembly on Thursday to pass the bill over the Governor's veto was lost by a vote of 65 to 45. In the Senate on that day the bill regulating the charges of elevating grain at Buffalo and other points was lost by a vote of 15 to 13, not a constitutional majority. It was a great disappointment to the canal men who supported the free-canal amendment. The Apportionment Bill was passed in the Senate on Friday by 19 to 8. In the Assembly the bill increasing the number of Surrogates in New York city from one to three was ordered to a third reading. The Keyes General Street Railroad Bill was passed, after having been amended so as to exempt Lexington Avenue in this city from the provisions of the act, and protecting existing railroads from interference as to rates. Tuesday was an active day in both branches of the Legislature. In the Senate the Prohibitory Amendment was lost by a vote of 13 to 18; the New York Aqueduct Bill was passed, 19 to 10; the Ramapo Water Supply Bill was passed, 19 to 1; and the bill for the protection of birds, fish, and game was defeated. In the Assembly the bill for the reorganization of the Dock Department of this city was defeated by a combination of Republicans and Tammany Democrats, after it had been so amended by Republican and Anti-Tammany votes as to give the Mayor the sole power of appointing the one Commissioner. In the evening the Assembly ordered to a third reading the State Civil-Service Reform Bill, but refused by a large majority to take up the bill establishing civil-service rules for this city.

Charges of heresy were preferred on Wednesday against the Rev. R. Heber Newton, Rector of All Souls' Protestant Episcopal Church, of this city, based on his sermons delivered last winter, on "The Right and Wrong Uses of the Bible." They were presented to Bishop Potter by the Rev. Dr. Buell, the Rev. Randolph H. McKim, and the Rev. Dr. B. F. De Costa.

A dinner was given to the great Italian actor, Salvini, at the Hotel Brunswick, in this city, on Thursday evening, by more than one hundred representative citizens of New York.

A strip of territory nearly one hundred miles wide, and extending nearly across Texas from northeast to southwest, was visited by a great storm of wind, hail, and rain, assuming the severity of a cyclone, on Friday night, doing great damage to crops, buildings, and property generally, and killing and wounding many people.

Philip B. Thompson, jr., killed Walter Davis at Harrodsburg Junction, Ky., on Friday morning. Thompson is a member of the next Congress. Davis had sold out his grocery and was on his way to Chicago when Thompson saw him. A scuffle ensued. Davis started to leave the cars, when Thompson pulled out a pistol and shot him. Davis was a wealthy man, and Thompson accused him of the seduction of the latter's wife. Both lived at Harrodsburg. After the shooting, Thompson returned to Harrodsburg, and going into court made a statement of the wrongs which led to the homicide. He was bailed for $5,000. His wife says that Davis was innocent, and she only wanted opportunity to prove it.

Rear-Admiral Edward Middleton, United States Navy (retired), died at his residence in Washington on Friday evening. He was born

in South Carolina, and entered the naval service July 1, 1828.

General William Browne, professor in the Georgia State University, died in Athens, Ga., on Saturday. He had a position in the British diplomatic service, but when thirty years of age came to America, and for a time was a journalist in this city and Washington. He was Assistant Secretary of State of the Confederate Government under Robert Toombs, and afterward went on Davis's staff as General of Georgia's conscript forces. For years General Browne had been one of Jefferson Davis's most intimate friends, and he assisted in the preparation of Mr. Davis's book.

Eliza Pinkston, the famous Louisiana witness in the electoral controversy of 1876–77, has died in jail at Canton, Miss., where she was serving a term for larceny.

FOREIGN.

The second trial of Timothy Kelly, for participation in the Phœnix Park murders, was concluded in Dublin on Wednesday morning. The Judge in his charge spoke strongly against the prisoner's claim for an alibi. The jury were out only a short time, and after returning announced that they had been unable to agree on a verdict. They were sent out again and again, and after reporting the fourth time that they could not agree they were discharged. It is said that ten of the jurors were in favor of conviction.

Michael Fagan, charged with the murder of Mr. Burke, was put on trial in the same court, after the conclusion of Kelly's trial, on Wednesday. Great difficulty was experienced in forming a jury. James Carey, the informer, was the first witness for the prosecution. In the course of his testimony he declared that even now he wished to remove tyrants, and said he believed that it was no sin to kill Mr. Burke. There was some conflict between the evidence of two witnesses for the prosecution on Thursday. The trial was concluded on Friday morning, and the jury, after a short deliberation, returned a verdict of guilty. Fagan protested his innocence, but declared that he was a Fenian. He was sentenced to be hanged on May 28.

The trial of Fitzharris, known as "Skin the Goat," one of the alleged principals in the murder of Lord Frederick Cavendish and Mr. Burke, was begun on Monday morning in Dublin. He was acquitted on Tuesday, no evidence having been produced to show that he knew of the guilty intentions of the murderers whom he drove in his cab.

A printer named Gibney was arrested in Dublin on Friday for connection with the conspiracy to murder, and was arraigned in court together with Eugene Kingston, who was recently arrested in Liverpool. A charge of conspiracy to murder Poole, a Fenian Centre who had turned informer, was entered against them. The man Devine, who was arrested at the time of the affray in Abbey Street, when Detective Cox was murdered, and who has turned informer, was called to testify against the prisoners. Devine swore that he was a Fenian. He said that several Fenians had condemned Poole to death, and had ordered the prisoner, Kingston, to carry out the sentence. He swore that the society of which the prisoners were members had decided upon the murder of Detective Cox and Judge Lawson. The society had also sentenced Mr. Jenkinson, Director of the Irish Criminal Investigation Department, and Mr. Mallon, Chief of the detectives, to death. It had plotted to destroy by dynamite the house in which Crown witnesses were lodged, and had murdered the informers, Kenny and Bailey.

It was reported in London on Monday that documents containing charges against the dozen persons, now in America, who are accused of the murder in Ireland of Kenny and Bailey, have been forwarded to Mr. Sackville West, the British Minister at Washington. Secret negotiations, it is said, are now proceeding between the British and American Governments with a view to the extradition of the men.

It is understood in London that the evidence against Peter Tynan (Number One) from independent witnesses, as well as from informers, is such as to justify decisive action by the English Government in asking for his extradition.

Carmody and Morgan, two of the men arrested at Cork on charge of being dynamite conspirators, were discharged on Thursday, and O'Herlihy and Kennedy, *alias* Featherstone, were sent to Liverpool for trial, where they were arraigned on Friday and remanded for one week.

The seven prisoners, Doctor Gallagher, Bernard Gallagher, Whitehead, Dalton, Ansburghe, Wilson, and Curtin, who are charged with treason-felony in connection with the unlawful use of explosives, were again arraigned for examination in the Bow Street Police Court, London, on Thursday morning. The evidence produced was strong against Whitehead and Bernard Gallagher. The hearing was adjourned for one week.

Alarm was caused in London on Saturday by the receipt by the Corporation of an anonymous letter warning that body that the Guildhall would be destroyed by dynamite on the 6th of May. A force of special police was detailed to guard the building.

Mr. Parnell, in a recent interview, said: "We have nothing to hope from the present Parliament, absolutely nothing. It is resolutely set in advance against every proposal in the Irish interest, even against such legislation as humanity demands. We seem to be alone in Parliament. We are alone. We are foreigners."

In the House of Commons on Thursday evening Mr. Gladstone warmly supported the Affirmation Bill. He considered that the Bradlaugh controversy should be brought to a close. He asked what had the Liberals or the Government to gain in the struggle. Did the Opposition suppose that in every case of a contested election he did not know that the Liberals lost votes and the Tories gained them? The Liberals had suffered on this account as they had previously done on the question of Catholic emancipation and the admission of Jews to seats in Parliament. Yet he hoped the Liberals would not be deterred by temporary losses from walking in the path of equity and justice. The London press pronounces the oration one of Mr. Gladstone's greatest efforts.

The race for the Two Thousand Guineas Stakes, at Newmarket, England, on Wednesday, was won by Lord Falmouth's brown colt Galliard. Prince Batthyany, a well-known patron of the turf, died suddenly in the enclosure for members at the beginning of the race.

The French Senate on Thursday, by a vote of 200 to 71, passed the bill converting the 5 per cent. rentes into 4½ per cents.

A bill providing for an appropriation of 5,000,000 francs for the Tonquin expedition was introduced in the French Chamber of Deputies on Thursday by the Minister of Marine. The bill does not contemplate a warlike enterprise, but merely an expedition of such a scope as will support the claims of France in that country. The expedition will consist of one ironclad, six torpedo boats, two gunboats, and three transports for the conveyance of 1,500 troops, and is ready to sail. These additional troops will make the force in Tonquin 3,000 men.

An explosion of gas occurred on Wednesday evening at the Ambigu Theatre, Paris, while a performance was being given. Twenty persons were injured. The audience quietly departed, being ignorant of the catastrophe.

Jules Amigues, a well-known French journalist and man of letters, is dead at the age of fifty-four. He was an ardent supporter of the Emperor Napoleon during his life, and after his death opposed the Republic with bitterness. He was the author of several novels and romances.

The answer of Prussia to the letter of Cardinal Jacobini, Papal Secretary of State, has been submitted to Emperor William. It asserts that certain penal clauses of the objectionable laws might be abolished if the Vatican would consent to make concessions with regard to giving notice to Prussia of clerical appointments. Herr Windthorst on Wednesday made a motion in the Chamber of Deputies for the removal of the restrictions on the saying of mass. It was rejected by a vote of 229 to 138. A Conservative motion expressing the hope that the Government would, when the negotiations with the Vatican made it appear advisable, proceed to make an organic revision of the May laws, was adopted by a vote of 209 to 154, despite Herr von Gossler's (Minister of Worship) declaration that the motion tended to the prejudice of diplomatic action.

Prince Bismarck's organ, the Berlin *North German Gazette*, in a recent article, says the mass of work now before the German Ministry is beyond the power of the existing staff to perform. It dwells upon the condition of the Chancellor and other members of the Ministry, who are ill.

There has been severe criticism in several German newspapers, notably the Berlin *North German Gazette*, of United States Minister Sargent's letter to the American Secretary of State on the subject of German prohibition of the importation of American pork, in which he speaks of the advisability of retaliatory measures. No information has been received at the State Department in Washington in regard to the controversy. Mr. Sargent, in an interview published in a Berlin paper, declared that there was no truth in the statement that he had said that the prohibition of the importation of American pork was an illegal measure, and was carried despite the opposition of the Reichstag. It is considered hardly probable in Berlin that the attack of the *North German Gazette* will make the resignation of Mr. Sargent necessary. Mr. Sargent has had little direct intercourse with Prince Bismarck since his arrival in Berlin.

Hermann Schultze-Delitzsch, the celebrated German political economist, is dead. He was born in 1808. He was the originator in Germany of a new coöperative scheme for the assistance of workingmen independent of the state. So successful was he that in 1873 Germany already contained 834 loan associations, with 400,000 members and a capital of 1,340,000,000 marks: and these numbers are continually increasing. The latest report is dated 1878, and enumerates 2,896 loan associations.

The Czar of Russia and the Grand Duke Constantine, uncle of his Majesty, have become completely reconciled through the mediation of Princess Dolgoruki.

There have been dissensions in the Spanish Cabinet during the week Señor Giron, Minister of Justice, differs with his advanced colleagues. The Budget Committee of the Chamber of Deputies on Wednesday adopted a resolution reducing the increased expenditures proposed by General Martinez Campos, Minister of War, who thereupon resigned his position in the Cabinet. On Thursday he withdrew his resignation, and the crisis was temporarily averted. On Friday the Budget Committee of the Spanish Chamber of Deputies withdrew the amendment to reduce the expenditures for the War Department proposed by Marshal Martinez Campos. It resolved, however, to urge him to give his assent to measures of economy compatible with the efficiency of his Department.

The revolution in Ecuador is not yet ended. Veintimilla's terms have been rejected by one of the revolutionary party. He has made other proposals to Alfaro, a member of the triumvirate.

MR. GOSCHEN ON THE ALLEGED SCARCITY OF GOLD.

MR. GOSCHEN has been repeating, in an address before a meeting of business men in London, the substance of the speech which he delivered some months ago in London on the increased purchasing power of gold, or, in other words, what is commonly called its "appreciation." He proves this appreciation by a table of prices which includes provisions, raw materials of various manufactures, metals, and clothing, in all of which he shows a fall of from 5 to 20 per cent. between 1870 and 1880. There are in England certain prominent and at first sight puzzling exceptions to this rule, such as tobacco, beer, spirits, and meat, but these exceptions can be readily accounted for. He explains the decline in prices by the absorption for currency purposes of about $1,000,000,000 during these ten years by Germany, Italy, and the United States, which have during that period either resumed payment in gold or substituted a gold for a silver standard. The fact that during this period new and great economies in the use of gold have been introduced, by the extension of banking facilities and by the use of securities in the settlement of international balances, is acknowledged by Mr. Goschen. He believes, nevertheless, that "the economies effected do not counterbalance the strain put on gold in consequence of the increased demands of the population and the increased transactions."

The *Economist* criticises Mr. Goschen's speech upon perfectly scientific grounds, by showing that although general prices did fall, as shown, between 1870 and 1883, yet the fall did not take place in the way which Mr. Goschen's theory would seem to require. Until the year 1877 the United States had taken no steps to accumulate gold for the purposes of resumption, and Italy had not even considered the subject of resumption. The sole disturbing force in the market up to that time was Germany. Yet the fall of prices between 1873 and 1877, when the disturbing force was least, was much greater than in the later period, when the United States and Italy were drawing from the world's stock for resumption purposes. Moreover, there has been a perceptible though not a very marked rise in prices since the beginning of the year 1879, while according to Mr. Goschen's theory there ought to have been a continuous fall.

There is, perhaps, no more slippery subject in the domain of economics than the effect which a greater or less supply of gold has upon trade and upon the prices of commodities at given times. J. S. Mill thought that the only case in history where it was perfectly certain that a general rise of prices was due directly to an increased supply of the precious metals was the period following the discovery of America. This period of rising prices embraced two centuries, and, as the rise was general and pervasive, and not spasmodic, as it overlapped the alternations of good seasons and bad seasons, good trade and bad trade, speculation and panic, there was every reason to ascribe the rise to the great output of the silver mines of Mexico and Peru. Coming to more recent times, there is good, if not actually conclusive, reason to believe that the output of gold from California and Australia, during the ten or twelve years beginning with 1848, had a real and lasting effect upon prices. We all know that these great discoveries and new supplies of gold did not avail to save the world from the commercial crisis of 1857—the most widespread and disastrous, perhaps, that has ever afflicted the business community of two hemispheres.

It is not equally clear that any fresh and extraordinary demand for gold has ever caused a decline in prices. The fall of prices from 1873 to 1879 is explainable upon philosophical grounds, without any reference to the accumulations of gold by the Governments of Germany and America. There was a panic in the year 1873 resulting from a long course of speculation, which had carried prices up to a dangerous and disastrous height. Looking at former panics in the world's history, when there was no disturbing force arising from the greater or less supply of gold, and the causes and effects were commercial and not monetary, it is easy to see that the reaction of prices after 1873 might and probably would have taken place even if Germany had not adopted the single gold standard, and even if the United States had not, some five years later, begun to add to her stock of gold for resumption purposes. It should be mentioned that the United States carried nearly $100,000,000 gold in her Treasury as long ago as 1870, and that her subsequent accumulations with a view to resumption were much less than Mr. Goschen appears to imagine.

A STRANGE PROCEEDING.
